VOL. LXXXI—NO. 2088. THURSDAY, JULY 6, 1905. PRICE TEN CENTS.

LONGMANS, GREEN, & CO.'S NEW BOOKS

A New Work by Dr. DAVID J. HILL, U. S. Minister to Holland, Formerly Assistant Secretary of State.

A History of Diplomacy

In the International Development of Europe

By DAVID JAYNE HILL, LL.D.

In 6 Volumes. Octavo.

Vol. I. **THE STRUGGLE FOR UNIVERSAL EMPIRE.** 506 pages, with 5 colored Maps; Chronological Tables of Emperors, Popes, and Rulers; List of Treaties, etc., and Index. 8vo, $5.00 *net*.

"The present volume, on 'The Struggle for Universal Empire,' and the following on 'The Establishment of Territorial Sovereignty,' may be regarded as indicating the foundations of modern diplomacy. They trace the tragic history of the rise and conflict of two great international institutions, the Empire and the Papacy, the defeat of their ambitions, and the development of modern national states. In future volumes it is intended to consider the Diplomacy of the Age of Absolutism, of the Revolutionary Era, of the Constitutional Movement, and of Commercial Imperialism, thus bringing the history of international development down to the present time. Each volume, however, is intended to be for the period which it covers, a complete work in itself.

"An effort has been made to render the text of use and interest to the general reader. For the benefit of those interested in the sources from which the materials have been derived, or who may wish to make a more detailed examination of special questions, a list of authorities, documentary and literary, with suggestions and comments, have been appended to each chapter. The bibliography is intended, however, to be a selection rather than an inventory, and has been constructed with the purpose of indicating the works consulted and likely to prove most useful for reference.

"No pains have been spared to provide such historical maps and tables as may be needed to throw light upon the text and to resolve questions of geography and chronology. A chronological list of treaties and other public acts and a separate index have been added to each volume."—FROM THE PREFACE.

Briefs on Public Questions

With Selected Lists of References

By RALPH CURTIS RINGWALT, A.B., LL.B., Member of New York Bar, Joint-Editor of "Briefs for Debates," etc., etc. $1.20, *net*. By Mail, $1.30

This is a series of argumentative briefs and lists of references of twenty-five of the most important public questions of the day.

For greater precision in the argument, each brief has been prefaced with a concise proposition, stating the question for discussion. A few short paragraphs have then been given, explaining why the subject is important, what facts material to it are generally conceded by both sides, and what apparently are the chief points at issue. Then follows the brief proper, a discussion of these issues from the affirmative and negative points of view. Each main division of a brief is preceded by a list of references, giving information about or evidence in support of the statements that follow.

The list of Briefs is as follows:

POLITICS: I. Naturalization.—II. Woman Suffrage.—III. Negro Suffrage.—IV. An Educational Qualification for Suffrage.—V. The Restriction of Immigration.—VI. Chinese Immigration.—VII. Direct Legislation.—VIII. Proportional Representation.—IX. The Popular Election of Senators.—X. The Retention of the Philippines.—XI. The Monroe Doctrine.—ECONOMICS: XII. Protection and Free Trade.—XIII. Commercial Reciprocity.—XIV. Reciprocity with Canada.—XV. Shipping Subsidies.—XVI. Trusts.—XVII. An Asset Currency.—XVIII. Postal Savings Banks.—SOCIOLOGY: XIX. Government Ownership of Railways.—XX. A Postal Telegraph.—XXI. Municipal Ownership of Street Railways.—XXII. A Federal Divorce Law.—XXIII. The Single Tax.—XXIV. Compulsory Industrial Arbitration.—XXV. Government by Injunction.—INDEX.

John Knox and the Reformation

By ANDREW LANG. With 2 Photogravure Plates and 3 other Illustrations. 8vo, $3.50 *net*.

"He has brought into his pages the vivifying influence of a thoroughly fearless conception of his hero. . . It requires some courage for a biographer of that dour scourge of sinners to use the candor which MR. LANG uses in this book. Though we are all supposed to want to know the truth, and nothing but the truth, about the great men of the past, we dare say that some readers will flinch, momentarily, at least, before the truth as it is here set forth. They must admit, however, that MR. LANG is a singularly dispassionate writer. He will not whitewash John Knox, but neither will he allow prejudice to deepen such shadows as he has had to introduce into hisp ortrait of the man. On the contrary, there is a delightful undercurrent of sympathy running through the work, due to the author's profound appreciation of Knox's finer qualities."—NEW YORK TRIBUNE.

RUSSIA AS IT REALLY IS

By CARL JOUBERT
J. B. LIPPINCOTT CO., Philadelphia

An Exposition of Japanese Thought

Bushido

The Soul of Japan

By Inazo Nitobé, A.M., Ph.D.

Professor in the Imperial University of Kyoto. Introduction by W. E. Griffis

This is a revised and enlarged edition of a book whose subtle charm it is difficult to express in a paragraph. It is so packed with thought, so attractive in style, so rich in comparative illustrations of Oriental and Occidental ways of looking at things, with here and there a touch of satire, but never bigoted or narrow.

Bushido is the Japanese feudal equivalent of chivalry. It was an organic growth of centuries of military careers. It is unwritten, like the English Constitution, yet out of it has grown the Japan of to-day.

GENERAL INFORMATION

The instruction given at the School of Political Sciences is the natural crowning accomplishment of every liberal education. In each of its several branches, the pupil acquires the requisite competency for holding high State Offices (Diplomacy, Council of State, Court of Accounts, Inspection of Finances, Inspection of Colonies) in getting thoroughly prepared for the examinations and competitions which they call for, and is also trained for leading posts in all great private enterprises.

The pupils are admitted without examination, with the approbation of the Director and School Board; no University degrees are necessary.

Tuition comprises 2 years' course, which may be extended to 3 years. On completing his studies, every pupil who has successfully passed his examination receives his diploma.

SCHOLAR YEAR, 1905-1906.—The Scholar Year commences on 6th November, 1905, and closes on 2d June, 1906. Applications are received at the Secretary's Office, from 30th October, 1905. Application for the whole Course gives right to all the regular and complementary Courses and Conferences, and also access to the Library (about 25,000 Volumes and 160 French and Foreign Reviews and Newspapers). Per annum, $60.

A Special Pamphlet giving detailed information on the organization of the School and respecting the Professions for which the Pupil receives special training can be had by addressing to

L'ECOLE, 27 Rue Saint-Guillaume, PARIS.

The Nation.

NEW YORK, THURSDAY, JULY 6, 1905.

The Week.

What is now passing in Russia, in the playing for position of all the elements contending for revolution, peaceably or by violence, resembles a fleeting phantasmagoria. Strangest of all turns and spectacles is that of the Black Sea fleet infected with anarchism. The mutiny on the *Kniaz Potemkin* and murder of officers; the landing at Odessa of the dead body of an alleged victim of naval brutality, to be buried as if on a funeral pyre amid the flaming warehouses and shipping of the port fired by a demoniacal mob; the terrorizing of the port by the man-of-war; the failure of the rest of the fleet to molest it; its seeking provisions and coal in a Rumanian port and forcible expulsion, and its present piratic wandering in the Black Sea flying the red flag—this is the very climax of weirdness and mystery. Still, now as before, in spite of fresh sympathetic outbreaks at distant points, the laboring autocracy appears to get the upper hand of revolt, while arranging the constitution of the peace commission, whose members are already selected and will begin negotiations in August. We cannot hope to see, in the meantime, any cessation of violent endeavor not only to overthrow the existing form of despotism, but to put in its place polities which would leave the hapless Russians wearing "the name of Freedom graven on a heavier chain."

That intellectual detachment which was at the bottom of Mr. Hay's broad views on world politics appears most clearly in a private letter on the San Domingo matter, printed on Monday by the *Sun*. Throughout the note Mr. Hay maintains admirably the tone of a loyal Minister willing to accept personal responsibility for both the excessive zeal of his subordinates and the hotheadedness of his chief, but everywhere it is evident that the San Domingo business was none of his, and that he held the whole transaction in a certain scorn. The Dillingham protocol he had never seen until it was published He is willing to admit that there was "what might be called a critical state of things in San Domingo," but immediately adds, "if such a phrase is applicable to a country where every day has its crisis." But more interesting than these casual observations about Mr. Roosevelt's pet cause is Mr. Hay's general characterization of the worth of the Dominican treaty, which we parallel with certain expressions of the President's in his message of February 15:

MR. HAY.	MR. ROOSEVELT.
"If they [the Senate] reject it [the Santo Domingo protocol], I do not think it would be a great disaster;	"I call attention to the urgent need of prompt action on this matter. . . . It will be unfortunate from every standpoint if we fail to grasp this opportunity, for such failure will probably mean increasing revolutionary violence in Santo Domingo, and very possibly foreign complications in addition."
and it would certainly relieve the Executive of a vast amount of labor which is now imposed upon it by the claims of American citizens throughout all Latin America."	"The United States . . . must . . . actively intervene to protect the contracts and concessions of its citizens. . . . This course would render the United States the insurer of all the speculative risks of its citizens in public securities and franchises of Santo Domingo."

We need not labor the contrast between Mr. Hay's desire to wash his hands of the unfortunate American investor in Latin-American ventures, and the President's cheerful proposal of a world-wide underwriting of all American speculations in weak nations. It is clear that more than once Mr. Hay waived his better judgment for the sake of peace; it emphasizes our sense of loss to realize that his restraining influence in our foreign policy has disappeared.

If Secretary Taft did not try very hard to conceal his vexation with Chief Engineer Wallace for resigning just at this crisis in the affairs of the Panama Canal, he certainly had ground for irritation. Mr. Wallace does not figure to advantage. He bases his resignation solely on a tempting offer from a private corporation. Without a grievance Mr. Wallace must be considered one who took a matter of loyalty lightly. We are, nevertheless, not in sympathy with Secretary Taft's method of announcing his decision to dismiss Mr. Wallace. Apparently, the bulk of his statement consists of stenographic notes of a conversation with Mr. Wallace on Sunday week. We are getting some extraordinary state papers from Washington these days, and the blue pencil is sadly needed, both in the White House and in the departments. Secretary Taft has had burdens and tribulations enough, in all conscience, to put his nerves on edge, but that is no reason why his temper over Mr. Wallace's defection should be unveiled to the public. It was unkind to himself and undignified in a high officer of the Government. The same end could have been obtained, and the rebuke to Mr. Wallace been made a hundred times more stinging, if the facts had been put into twenty-five or fifty lines. Though we are a world power, we have a number of things to learn from other nations in similar positions, and one of these is the proper method of announcing just such matters as the change at Panama. Dignity and brevity should have made impossible the publication of Mr. Taft's repeated complaint that Mr. Wallace's action was so ill-timed as to threaten to interfere with the Secretary's trip to the Philippines, as of his further remark about the President's right "to discharge an unfaithful commission"—a needless slur upon the first Commission, now extinct.

The sudden appointment of ex-Ambassador Porter as Senior Special Ambassador in connection with the translation of John Paul Jones's putative remains, and the consequent reduction of Mr. Loomis to the grade of Junior Special Ambassador, proves that it is never too late to mend, that you never can tell, that second thoughts are best, that one must look before he leaps, or any other trite morality which may apply to a headstrong President. It is a welcome, if somewhat ridiculous, exit from an untenable position. In his eagerness to do honor to a favorite under fire, Mr. Roosevelt clean forgot Horace Porter, to whose zeal the recovery of Paul Jones's body, or of one "equally as good," is due. In this anxiety to pay a compliment to Mr. Loomis, Mr. Roosevelt came very near, also, to affronting the French Government. As the matter stands, Gen. Porter will have charge over all ceremonies up to the time of the consignment of the remains for transport. Since the mortal remains of a naval hero are not recognized collateral, they will be reasonably safe in the hands of Loomis, "Acting."

The Federal Grand Jury in Chicago, which has just indicted twenty-one officials of the Beef Trust, has declined to follow Mr. Roosevelt's advise and proceed against the corporations only. Evidently its members agreed with Messrs. Judson and Harmon that guilt must always be personal—and the country as a whole will applaud their decision. At last we shall ascertain whether a corporation can violate the laws, and the individuals who direct its actions escape scot free, as did Paul Morton. The whole anti-Trust campaign hinges upon the conduct of this case. By Mr. Roosevelt's direction the Federal law officers are forbidden to take action against Trust magnates or those who grant railroad rebates until they have first tried to stop the objectionable practices, or unless there is clear legal proof of their guilt. As they were not allowed in the Paul Morton case to take the only course which would judi-

cially bring out his guilt or innocence, their hands are practically tied. Mr. Roosevelt did, however, hint that the Attorney-General might take action if the Chicago jury acted, because, as he wisely added, if they should indict, "it will be because in their judgment legal evidence of the violation of the injunction has been laid before them." Well, the jury has indicted, and the Attorney-General's office may now render such aid as it can. It ought to bend all its energies to the task before it in Chicago, for, if this process fails, the corrupt corporations which defy the laws the country over will more than ever feel themselves superior to them, while their officials will be convinced that Mr. Roosevelt is right, and that guilt is impersonal.

When the "Dawes Commission" organized for allotment work in 1898, after several years of missionary effort spent in bringing the tribes to agree that isolation was no longer possible, it was not anticipated that the task would extend beyond 1900. But the details grew in volume. Nearly half a million applications were received from individuals who wished to share in the distribution of tribal lands. Out of this number, some 87,000 have been recognized as members of the various tribes. Nearly twenty million acres of land were to be surveyed, appraised, and allotted in shares of equal value to the tribesmen in proportion to the tribal holdings in the Territory. In the small Seminole Nation 2,775 Indians have been given 320,000 acres of land; nearly 16,000 Creeks have been put in possession of three million acres of allotments; the Choctaws and Chickasaws, to the number of 33,565, have divided over eleven million acres in the southern half of the Territory; and more than 35,000 Cherokees have been adjudged rightful claimants to five million acres in the northeast corner of Indian Territory. In barest outline, this has been the work accomplished by the Commission first suggested and headed by the late Henry L. Dawes, ex-Senator from Massachusetts. The expenses of the Commission have aggregated about $1,500,000, and the amount of detail involved has been enormous. Questions like that of settling the status of freedmen (the descendants of slaves held by Indians before the civil war), and the determination of the rights of the Delawares in the Cherokee lands, have delayed the Commission's work. Though formally disbanded on July 1, a portion of the allotting force, under Tams Bixby, ex-chairman of the Commission, will carry the unfinished business to completion.

The Curtis Act of 1898, the law under which the "Dawes Commission" has been working, provides that most of the tribal governments in the Territory shall expire next year. Unless Congress takes prompt and decisive steps either in joining Indian Territory to Oklahoma as a State or in erecting a temporary Territorial Government over all the tribal lands, we shall witness the curious anomaly of a country without any organized government. Nearly 90,000 Indians have, very properly, been given what belonged to them; nearly 500,000 whites are demanding the right to levy taxes to build schoolhouses, bridges, and roads, and to do business unhampered by tribal laws. Secretary Hitchcock, by standing firmly for the enforcement of tribal laws, so long as as they are laws, is doing more than anybody else to call attention to an intolerable state of affairs. Naturally, the land-grabbing whites who have followed the allotting work of the "Dawes Commission" and fattened on leases from the allottees, are raising the Statehood cry loudly. The Secretary of the Interior has been a thorn in their side for a long time because of his insistence that leasehold contracts shall be fair to the Indians, and that contracts for the sale of allotted land shall be approved by the Interior Department. The "Dawes Commission" has practically finished its work. The Indians have been got ready to meet Statehood. It is now for Congress to deal with a half-million disfranchised whites who have brought Indian Territory up to the level of Oklahoma, Kansas, and Texas, industrially.

For the fiscal year ending June 30 the Secretary of the Treasury estimated, in his report of last December, an $18,000,000 excess of expenditure over revenue. The deficit, as now pretty closely ascertained, will run at least seven millions beyond that sum. It is characteristic of the Government's present tendencies that this official under-estimate of the shortage did not result, like some of the Treasury's erroneous forecasts of a dozen years ago, from too optimistic hopes of revenue. On the contrary, the public income has more than equalled the Secretary's predictions. It is the steady rise in expenditure—exceeding not only the figures of last year, but the Treasury's expectations of six months ago—which has done the mischief. Examination of the Department's daily statements shows that, while army expenditure has risen some $7,000,000 over the fiscal year 1904, and outlay on the navy $15,000,000, the cost of the Government's civil establishment has also increased $15,000,000. Moreover, this last-mentioned branch of expenditure has turned out $9,000,000 larger than Secretary Shaw's own estimate of last December. He then, with half of the fiscal year already past, assigned $138,000,000 for that part of the public service. Its cost will exceed $147,000,000. Last year, after deducting the Panama payment, the cost of the civil establishment was $132,000,000; in 1903 it was $125,000,000; in 1902, $113,000,000. An increase of 30 per cent. in three years in a branch of public expenditure where waste and extravagance are proverbially apt to gain control, should serve to set people thinking. Serious reflection would certainly be stimulated if the suggested tax on bank checks or on coffee were proposed to make good the deficit.

The platform adopted by the Democratic State Convention of Ohio reads as if it might have been framed by a committee made up of Gov. Folk, Senator-elect La Follette, and Mr. Bryan. In reality, it is the product of a platform committee dominated by Tom L. Johnson and M. E. Ingalls, the Cincinnati railroad man. On national questions the document is brief. It applauds the Administration's attempt to purchase Panama Canal supplies in the open markets of the world, and demands that Congress shall enact specific anti-rebate legislation, and increase the powers of the Interstate Commerce Commission. On State issues the platform dwells at greater length. Mayor Johnson's plank pledging the party to the enactment of a law reducing railway fares in the State to two cents a mile was rejected, but a provision was inserted declaring for the taxation of railway property at its salable value. The appeal for home rule for cities and towns is timely. Tom Johnson's influence appears in the adoption of a plank putting the question of municipal ownership of public utilities before the voters of each municipality. In view of the well-known character of the Cox-Foraker-Dick rule in Ohio, it is to be hoped that Mr. John M. Pattison of Cincinnati, the candidate for Governor in opposition to Gov. Herrick, who was renominated by the Republicans recently, may have an opportunity to make effective that section of the platform which pledges the Democratic party, if successful, "to use its utmost endeavor to eliminate the 'graft' and political corruption that have been nourished and fastened upon the State by the Republican party in the last few years." Such a result would be infinitely encouraging to other boss-bound States in addition to Ohio.

The only scientific studies of the negro question being made to-day are those carried on by Atlanta University. This year it held its tenth annual conference, which devoted part of its time to reviewing the progress of the negro in the last ten years. Its conclusions, signed by Prof. W. E. B. Du Bois, L. M. Hershaw of the United States Land Office, and Walter F. Willcox of Cornell

University, special agent of the Twelfth Census, primarily bring out the fact that there is growing up a demand for genuine knowledge in place of prejudice or mere opinion about the negro question. A striking belief expressed by the committee is that there has been a progressive differentiation of the negroes into social and economic classes, which makes it unjust to characterize the race as if it were a unit. That the mortality of the negro is decreasing, particularly among children, is another conclusion, while the great increase in the number of good homes and in the organized efforts for social betterment is obvious to even the casual student of the subject. Up to 1895 there was an alarming growth of negro crime; since that time there has set in a steady decrease, which is the proper corollary to the greater effectiveness of the negro church and the steady prosperity of the colored business man. The severe economic crisis among negro artisans is also touched upon. Finally, the investigators believe that future studies should go into the many unsettled questions relating to the vitality of the negro, his economic efficiency, his moral habits, and his capacity for government, and into the means of improving all these. They also ask that an endowment for the work of this conference be secured.

Mr. Rockefeller's gift of ten millions to the higher education is remarkable from many points of view. It is, of course, the largest donation ever made for general purposes, and it is admirable in that there are practically no restrictions of any kind. The only limitation is a wise one: that no sectarian colleges teaching in a sectarian way shall benefit by the fund. Excellent, too, is the fact that the gift applies to the entire United States, and not to any section. Its income, which will be perhaps $450,000, will not, of course, revolutionize our hundreds of colleges nor lift them all, even in twenty-five years' time, out of their pressing financial difficulties. Compared to their wants, this will be only a small sum annually. But the example should lead to other similar donations for general needs, either for buildings or for running expenses or for endowment purposes; and Mr. Rockefeller himself states that there is more of his money to come. Perhaps most laudable of all is the decision to give to the General Education Board, an organization which has already demonstrated its value in the Southern educational field, and should from now on exercise a very great influence on the development of the higher education in America. The small sensation excited by so princely (as well as wise) a gift affords striking evidence of the change in the scale of values wrought by the fall in interest.

The action, on June 28, of the three voting trustees of the Equitable Life in filling nine of the vacancies caused by resignation of former directors, was in line with their pledge to allow policyholders a voice, and to choose a portion of the new management from their ranks. The nine new names were not submitted according to a vote of the policyholders as a body, but in deference to the wishes of various policyholders' committees. Under the circumstances, this was the most practical course to follow. It would have been impossible, on this short notice, to obtain effective expression of majority preference on the part of the company's 600,000 policyholders. For such a vote to be of any value, a thorough canvass of the company's membership, and probably organization of proxy committees, would be necessary. We are not sure that expression of preference through policyholders in various sections or communities, acting through committees of their own, may not be a useful precedent. Exactly how far the various existing committees of this sort are fully representative, is doubtful; but it is possible for them to become so in the future. Assuming a voting power, direct or indirect, to be enjoyed by Equitable policyholders, their position would be akin to that of a large community on which popular suffrage is suddenly conferred. Without preliminary caucuses, without canvass of nominees, first by small groups and then by large groups of qualified voters, mere confusion would result, with the ultimate choice dictated, probably, by secret cooperation of a minority with interests of its own. This is precisely the situation of half a million policyholders suddenly asked to choose directors. It would equally be their position in case of absolute mutualization. In our purely mutual companies, indeed, the society's vote is commonly procured through requests for proxies in favor of the existing management, whose candidates never are opposed.

On the question of the elder Hyde's culpability in the matter of leases made by the Equitable to smaller companies controlled by Equitable directors, his son's reply to Superintendent Hendricks's report takes issues with that document. Mr. Hyde makes perhaps as good a case for his father as was possible, so far as regards the original contracts with these companies. The weakness of his case, however, appears at once when he argues that, whatever the pecuniary results of these leases (Mr. Hendricks proved in at least two cases an absolute loss to the Equitable), "it does not follow that, because the rentals seem low at the present time, they were unfair when made." Possibly; but Mr. Hyde ignores the fact, very damaging to the recent management, that, as the earlier leases expired, at various dates during the past twenty years, they were "regularly renewed on the same terms, or on terms even more unfavorable to the Equitable." The salient point is the opportunity which undoubtedly existed, in this direction and in the investment of Equitable money in such companies, for underhand profit at the Society's expense. It was these considerations which moved Superintendent Hendricks to conclude that "there can be no question of the wisdom of prohibiting the investment of the funds of life-insurance companies in subsidiary moneyed and business corporations controlled by life-insurance companies"; which led the Frick committee to declare that, "judging these investments either on general principles or on their specific results, their wisdom is gravely questionable," and which called forth from the Morgan committee, as long ago as 1877, the very positive declaration that "it is not believed to be wise for institutions of the character of the Equitable Society, in order to obtain a suitable rent roll . . . or for any other purpose, to be in any way connected with any other corporation, however valuable the stock of such corporation may be."

If to be slow to wrath is a virtue, Sweden deserves great credit, and, in fact, it is highly praiseworthy in the King and Cabinet to consider the secession of Norway, not in the light of natural resentment, but in that of reason and justice. One must hope that this temper may prevail over the hotheads in the Riksdag, who advocate fighting to bring Norway back into the union. Clearly, a war would not mend matters. What is needed is not a renewal of the very unsatisfactory union just broken, but a satisfactory *modus vivendi* as a stage towards a more permanent union. If Sweden should follow her sagacious monarch in taking this patient and expectant attitude, it is possible that time and considerations of common defence might bring Norway back. From this point of view it is to be hoped that Sweden will not exercise her undoubted right to protest against the diplomatic recognition of Norway. A frank acceptance of the present state of affairs might be the prelude to eventual reconciliation, whereas to establish a diplomatic blockade of Norway would only embitter already strained relations. So far, in spite of hot words at Stockholm, both contestants have given an admirable example of equanimity, and it is to be hoped that in time the unity of the Scandinavian kingdom may be restored. But this cannot profitably be brought about either by war, or by increasing vexatiously the difficulties Norway must inevitably meet as she seeks international recognition. Meanwhile, as was almost inevitable, there is a show of military preparedness.

JOHN HAY.

The late John Hay represented to the full both theories of genius. He had capacities so marked and versatile that everything he undertook was done with a kind of divine ease, and he had a special training so laborious and protracted that his success might be accounted for as the result of sheer application. What distinguishes him from a score of illustrious predecessors in the State Department is a certain literary, or, if one will, artistic quality of temper. It requires flexibility of mind to write devil-may-care ballads after you have served in the legations of Paris, Vienna, and Madrid. It needs a ready sympathy to be forty-odd, to be an ex-diplomat and Assistant Secretary of State, and then to make the literary sensation of the season with an anonymous novel on the labor problem—'The Breadwinners.' In fact, it was because Mr. Hay so thoroughly represented what Bliss Perry has eulogized as the "amateur spirit," that he was a figure not only potent but fascinating in all of the many walks of life he entered. From his Jim Bludsoes to the epigones of the Metternich school, he was able to meet all sorts and conditions of men on their own basis; he prevailed through a superior imaginative quality, which he reinforced with an amazing variety of material information. That anecdote is characteristic which tells how a famous art critic, dining at Mr. Hay's table at Washington, displayed distress at a landscape by Constable which hung on the opposite wall. When his trouble had been noted and its cause asked, the connoisseur deprecatingly regretted that Mr. Hay had been taken in by one of the cleverer sort of forgeries. Unruffled, the host first pointed out the intrinsic marks by which the authenticity of the picture was established, and then observed, as if casually, that he had had it of Constable's heirs, and could trace it direct to the artist's studio.

But if Mr. Hay illustrated in a singular degree the virtues of the "amateur spirit"—a quality which gave a refreshingly personal tinge to all his policy as a statesman—he acquired an extraordinarily complete and professional training for the post he finally adorned. The young Brown graduate and member of the bar of Illinois who, in 1861, became Lincoln's private secretary, was immediately thrust into the minutiæ of civil and military administration under the care of a great statesman. Whatever dose of diplomacy went with the private secretaryship was confirmed by experience as secretary of legation at Paris and Madrid and chargé d'affaires at Vienna. It is needless to say that the spade work of diplomacy is done not by the ambassadors, but by their secretaries. John Hay could have had no better discipline. Furthermore, his Paris incumbency fell at the time when Louis Napoleon's "principle of nationalities" was stirring all Europe. From the vantage point of Paris the young secretary saw the seizure of the Danish Duchies and the humiliation of Austria by Prussia, the expulsion of the French from Mexico, and the assembly of Karl Marx's first congress of International Socialists at Geneva. Within his short term at Vienna fell Deák's reconstruction of the Austrian Empire on a basis of dualism, the liberation of Servia, and the abolition of the Japanese Shogunate. His brief "Castilian" days followed Marshal Prim's republic, and witnessed the reëstablishment of the Bourbons and the beginning of President Grant's negotiations for the annexation of San Domingo—the true precursor of the expansionist policy which Mr. Hay was later to direct.

Evidently here was matter to kindle the diplomatic imagination. And Mr. Hay had had enough of it, for he contented himself for several years with being the chief editorial writer for the *Tribune*, and its acting editor for a period, and with outbidding Bret Harte in narrative verse and Bayard Taylor in descriptive prose. After a digression given to journalism, literature, and the extension of valuable social relations, Mr. Hay completed his diplomatic education by two years of service as First Assistant Secretary of State to Evarts, 1879-81, thus learning the routine of the department he so brilliantly conducted twenty years later. The portentous task of writing, with Col. Nicolay, the ten volumes of the 'Life of Lincoln' must be counted as a labor of love, since Mr. Hay, through a marriage fortunate in all respects, had long been beyond the need of money-getting. His great opportunity came in the election of Mr. McKinley, who was doubly bound to Mr. Hay by personal friendship and by material benefactions.

As Ambassador to England Mr. Hay's success was personal rather than diplomatic, but as Secretary of State, since 1898, his peculiar abilities have gained world-wide recognition. It was typical of his manner of thought that the sensational episode of the siege of the Peking legation did not suggest spectacular vindication of national honor, but hastened the execution of a humane plan, previously conceived, for the rehabilitation of the troubled Empire. By patient consultation with the European Powers he succeeded in imposing the principle that China was no longer a field for spoliation, but was to be open on equal terms to the trade of the world, and was to have its opportunity for national reform and development. Mr. Hay's circular notes on the Mantchuria question were the object of some mockery, as merely academic. That tone has changed since it has been perceived that the Japanese triumph is merely one interpretation of Mr. Hay's doctrine, and Mr. Roosevelt's humane mediation between the combatants another. These facts have completely borne out Mr. Hay's prophetic vision that the Chinese question is one in morals as well as in international politics, and that the time for European aggression has passed.

It would be unworthy of Mr. Hay's own great achievements and personal candor to fail to point out that he had not only the qualities, but the defects, of the amateur spirit. His desire to illustrate his office, his quick imaginative response to distant situations, led him at times into empty undertakings, like the Rumanian circular against persecution of the Jews. His devotion to the project of the Panama Canal and to that of national expansion generally drew him into more than one equivocal transaction in the national behoof, as his admirers must acknowledge with averted faces. But his administration, taken broadly, was characterized by scholarship, dignity, and resourcefulness. In seven years he has raised the State Department from a condition of relative provincialism to a commanding position among the chancelleries of the world. Mr. Hay is most likely to be remembered for that magnanimous stand in the Far East which stemmed the tide of brutal aggression upon helpless China. His associates and our generation of brethren of the pen will remember with most affection the *littérateur* who, amid the gravest responsibilities, vindicated the practical value of the artistic imagination.

THE FRANCHISE IN MARYLAND.

The campaign now beginning in Maryland has an uncommon interest for the rest of the country, because we have there for the first time "white supremacy" as the chief, indeed, almost the sole, issue in a State outside the "solid South." Party lines on this question are likely to be often broken this fall, for many influential Democrats, among them Gov. Warfield and Attorney-General Bryan, have refused to follow the lead of the Gorman organization, and, on the other hand, many Republicans of "lily-white" leanings will undoubtedly favor the amendment. It is, in fact, the avowed object of its sponsors to induce voters to divide at the polls by races, and not by parties. Before going any further, let us see just what this amendment is. After the usual provisions regarding residence, it provides that, in order to register, a male citizen must be:

(1.) A person able to read any section of the Constitution of this State submitted to him by the officers of registration and to give a reasonable explanation of the same; or, if unable to read such section, then to understand and give explanation thereof when read to him by the registration officers; or,

(2.) A person who on the first day of January, 1869, or prior thereto, was en-

titled to vote under the laws of this State or of any other State of the United States wherein he then resided; or,

(3.) Any male lineal descendant of such last-mentioned person who may be twenty-one (21) years of age or over in the year 1906.

The chief line of argument in support of this amendment is that, in adopting it, Maryland will merely be following the example of all the States farther south. "It thus reflects and adopts the latest and best views of the strongest men of the South," says Murray Vandiver, Democratic State Chairman. Let us, then, examine the Maryland clauses, not from our own point of view, but in the light of other Southern constitutions. Before taking up them in detail, one important distinction must be made. They are intended to be the permanent conditions of registration in Maryland. Voters may continue to come in under the second clause until the death of all those now fifty-seven years old or more, while the third remains practically in force until the first voters of next year are extinct. Now most of the constitutions directed against the negro vote have contained two different suffrage provisions—one being temporary and the other permanent. That is to say, they gave the ignorant or propertyless white man several years in which to put his name on the voting-list, but, if he neglected that chance, he was, under the law, placed on the same footing as the negro. Thus, we find Chairman Vandiver explaining that the first clause of the Maryland amendment "is taken from the present Constitution of Virginia." So it is, in truth, but it is a part of the temporary plan, and expired with the year 1903. The educational test in force in Virginia to-day is simply the writing of name, age, residence, etc., in the presence of the registration officers. Similar is the clause of the permanent plan in Louisiana, which provides:

"He shall be able to read and write, and shall demonstrate his ability to do so when he applies for registration, by making, under oath administered by the registration officer or his deputy, written application therefor, in the English language, or his mother tongue, which application shall contain the essential facts necessary to show that he is entitled to register and vote, and shall be entirely written, dated, and signed by him, in the presence of the resigstration officer or his deputy, without assistance or suggestion from any person or any memorandum whatever, except the form of application hereinafter set forth."

"Understanding" clauses have existed in South Carolina and Alabama also, but the former expired in 1898 and the latter in 1903. Alabama now requires that the voter "can read and write any article of the Constitution of the United States in the English language." In South Carolina, under the permanent plan, he must read and write, or own $300 worth of property. In Mississippi (as in South Carolina's temporary plan) the voter must "read any section of the Constitution of the State or be able to understand the same when read to him, or give a reasonable explanation thereof." Thus, for the requirement that the voter must read and understand the Constitution, there is only one precedent, and that a plan no longer in force. The other provisions just cited impose plain and simple tests that admit practically of no dispute. Even in Mississippi, if the negro can read, he is not put to the additional test of explaining. But to require from the man who has shown his ability to read "a reasonable explanation" in addition is simply giving to the registration officers absolute power to disfranchise. "What this would mean in practice, under the 2-to-1 system, everybody knows," says the Baltimore *News*.

We now come to the exemption of voters of 1869, and the "grandfather clause." Here again in the permanent plan of registration we find features that were never adopted in any Southern State except temporarily. Alabama exempted from the other tests soldiers and sailors in any of our wars—including the Spanish war, to which she sent a negro regiment—and their lineal descendants. This exemption ceased in 1903. In Virginia a similar provision, extending only to the sons of veterans, went out of force, along with the "understanding clause," on January 1, 1904. Only Louisiana and North Carolina conferred exemption on the voters of 1867 and their sons, as does, practically, the Maryland clause. In the former State this extended only to 1898, and in the latter it will expire on December 1, 1908.

Thus, to summarize it in a sentence, the Maryland amendment contains, as permanent features of the State law, the most extreme and objectionable of the clauses which the Southern States devised as temporary conditions of registration and have since superseded by fairer tests.

Now a word as to the State for which this objectionable measure is designed. To every 100,000 whites in Maryland there are 24,681 negroes. Proportionately, Virginia and North Carolina have more than twice as many; Georgia,, Florida, Alabama, and Louisiana more than three times, and South Carolina and Mississippi more than six times as many. Tennessee, Texas, and Arkansas, the only Southern States which have relatively less than twice as many negroes as Maryland, have none of them adopted any of the provisions which characterize the Maryland amendment. Though we should concede, as we emphatically do not, the perfect justice and fairness of the Gulf States' Constitutions, it would still be utterly preposterous to assert that any regrettable necessity compels the adoption of the same measures in Maryland. Moreover, the foreign element, which does not secure the benefit of the grandfather clause, and is subject, like the negroes, to the caprice of the registration officers, is very much greater than in any State farther South. It is relatively half as large again as in Texas, twice as large as in Florida, and nearly twenty times as large as in South Carolina. In no State further South is it true, as in Maryland, that the foreign-born whites and native whites of foreign parents outnumber the negroes.

A fair test of fitness applied to all voters alike, of whatever color, any State, North or South, has a perfect right to impose. But, seriously as some of the States have departed from this principle, the Maryland proposal touches a new depth of unfairness and partisanship.

THE USELESS ELECTORAL COLLEGE.

Speaking before the New Jersey State Bar Association recently, Mr. J. Hampden Dougherty discussed at length the history and present status of the constitutional and statutory provisions relating to the election of the President. "Of the various perplexing questions which the electoral court has presented," he says, "not one is solved by the act of 1887 [the law now in force]."

"It makes no provision as to what shall happen if constitutionally ineligible electors shall be appointed by a State; it does not declare whether the provision of the Constitution requiring electors to meet on the same day throughout the United States is mandatory or directory; it creates no tribunal for the determination of other difficulties arising in connection with the electoral vote, but simply empowers the two houses, practically without debate, in certain contingencies, to exclude the vote of a State, without prescribing any regulations for the government of their conduct—thus leaving them apparently to judge in any case by *ex post facto* legislation."

Mr. Dougherty's own conclusion is in favor of the entire abolition of the electoral college and the creation by constitutional amendment of some more direct system of electing President and Vice-President. He also holds that a Constitutional amendment would be necessary to repair the often-discussed omission of any provision for the succession in the event of the death of the President-elect between the meeting of the electors and date for his inauguration.

It ought not to be difficult, certainly, in the light of the experience of thirty elections, to draft a new article that would be at once simple and comprehensive. Several plans have been offered in the past which would supplant the electoral college without altering the relative influence of the several States. Thus, it has been proposed to let the people vote directly for Presidential candidates; the candidate carrying each State being then credited with as many votes as that State now has in the electoral college. Variants of that plan have been many. But, however strong the arguments against the electoral college may be, the necessary popular feeling to secure its abolition must be based largely

on the defects which it actually exhibits in present operation.

An eloquent member of Congress, as Mr. Dougherty recalls, long ago declared that a State Legislature, if so disposed, could legally delegate the power of choosing Presidential electors to a bank or even a synagogue. While we have not had, and are not even remotely likely to have, any such preposterous abuse of power as that, yet there have actually been employed in recent years a good number of devices by which partisan ends can be gained in the choice of electors. That is to say, the party which happens to be in control of the Legislature, without making a single convert or adding one name to its voting strength, can, by tampering with this precious electoral machinery, increase very considerably its own chances of at least partial success. The most conspicuous attempt of this kind was Michigan's return in 1892 to the system of choosing electors by districts, a method which, though once common, had been abandoned by the last State which used it in 1836. According to the rule prevailing in all the other States, Harrison, whose electors had in the aggregate about 20,000 more votes than those for Cleveland, would have had all the 14 votes of Michigan. As it was, Cleveland carried five of the electoral districts. It is worth recalling that, although it was a Democratic Legislature which adopted this method of snatching a brand from the burning, yet, had the same rule been universally adopted, Cleveland's electoral plurality would have been reduced from 132 to 96. It was pointed out by the *Evening Post's* Washington correspondent during the last campaign that a return to the district system in the Northern States would have eliminated all possible chance of a Democratic victory, by removing the opportunity for overturning by small pluralities a few States with large electoral votes.

But it is possible to increase considerably the difficulties of the "outs" without even disturbing the popular choice of electors on a general ticket. For an extreme case, take Florida, where the Republican vote at present is certainly not large enough to be formidable. The State is entitled to five electors, and four parties made nominations last fall. Under the extraordinary ballot law which the powers have decreed, the names of these twenty electoral candidates were printed in a close column one below the other, with no line or space to separate the parties, and no name, emblem, or other indication to show by which party each candidate was nominated. The Democrat had to mark the first five; the Republican, numbers six to ten inclusive; the Populist, numbers eleven to fifteen inclusive, and so on. Naturally a very large number of voters were muddled, and, in fact, 900 Democrats out of 27,046; 1,650 Republicans out of 8,314; 689 Populists out of 1,605; and 1,086 Socialists out of 2,337, failed to mark all the electors of their parties. This amounts, roughly, to 3½ per cent. of the Democratic vote, 20 per cent. of the Republican, 43 of the Populist, and 47 of the Socialist. In other words, if the Republicans should somehow succeed in carrying the State in 1908, the election law remaining what it is, the Democrats would still retain some of the electors unless the plurality of the Republicans amounted to a clear fifth of their vote.

It is customary to give the vote for "highest elector" in each State as the "popular vote" of a Presidential candidate. As a matter of fact, the real margin of victory is the difference between the lowest elector of the winning party and the highest of the losing. In Maryland, where a square for voting all electors at once on the ballot is similar to and immediately above that for the first elector, 2,504 Republicans made the mistake of voting for elector number one only, and that margin was wide enough for seven Democratic electors to come in, although it is indisputable that more Marylanders tried to vote for Mr. Roosevelt than for Mr. Parker. Massachusetts, to take an opposite instance, makes the voter take considerable trouble to "scratch" an individual elector; and while some do manifest their personal preferences this way, the difference between highest and lowest elector last fall was only 68 on the Republican ticket and 96 on the Democratic; .03 per cent. in one case, .06 in the other. Contrast these with the Florida figures, and see how the electoral system lends itself to trickery.

Certainly the movement to reform that feature of the Constitution which has departed farthest from the original intention of its framers, and has brought up more or less important disputed questions at more than half of our elections, does not have to rely on theoretical arguments for support.

THE COST OF LIFE-INSURANCE BUSINESS.

To one unacquainted with the mathematics of insurance, it seems surprising that, in consideration of an annual premium to be continued through life, a company can engage to repay on death or sooner an amount equal to the total premiums for a period of fifty years, or even one hundred years. But the possibility is a very simple result of computations based on the probabilities of human life, and on the increase of invested funds on which the interest is allowed to accumulate by constantly compounding itself. Given a table of mortality and a rate of interest, and the problem of determining what annual premium should be paid in order to secure a given payment at death (or after a term of years) is one which has long been worked out with great exactness. Of course, the result cannot be wholly free from the uncertainties which pertain to all human affairs. The actual mortality may be greater or less than that predicted from the tables, and the rate of interest may be greater or less than that taken as the basis of the premium. To guard against every contingency of this kind, a "loading" of about one-third is added to the mathematical premium. One conclusion is obvious at the outset. Supposing the company to be a mutual one, as is now almost universally the case, this loading properly belongs to the policyholder who pays it, and, if favorable experience has proved it unnecessary, it should be returned to him in the form either of a cash return or an addition to his policy. This repayment of a bonus has been so common and is so well understood that we need not dwell upon it.

Life insurance on a large scale may be said to date, in our own country, from the organization of the Mutual Life of New York more than sixty years ago. An experience of a few years with this company, and with those which were soon after organized, brought out a very gratifying result. Instead of the loading of the premium being necessary, it was found that the rate of mortality was markedly less than that predicted from the tables, while the rate of interest which the company, by good management, was able to gain, considerably exceeded the very low minimum on which the premiums were computed. Two large sources of profit thus poured their accumulations into the treasury of the company in addition to the loading on the premiums. The result was that, for a number of years, this and other companies were able, with perfect safety, to return profits to their policyholders on a scale which was agreeably surprising. The experience greatly facilitated the efforts of the companies to extend their business as widely as possible. Not only for this purpose, but for the business itself, an agency in every important town was considered necessary. One reason for this course was that a personal examination of the case of each applicant for insurance might be advisable to guard against the danger of fraud. Another reason, less legitimate than this, was the very general opinion that no one was going to insure his life unless solicited by an agent. We believe that no opinion has been more universally prevalent among life-insurance men than this; and yet, granting its truth to a limited extent under actual conditions, one cannot but think that some way of avoiding the expense of a universal system of solicitation could have been devised.

Whatever the necessity, the fact was that the expenses of management far ex-

ceeded the limit which economy would dictate in the case of a purely fiscal institution. During the few years before the civil war, the expenses of the largest and best-managed companies ranged from 7 to 9 per cent. of the total receipts, and those of the smaller and newly established companies were even higher. Such a statement of expenses was presented by the companies from a rather apologetic standpoint, the idea suggested being that, as the business enlarged, and solicitations by agents became less necessary, the expenses would naturally be reduced. In estimating the necessity for the expense, we must recall the fact that a life-insurance company is a purely financial institution, of which the main business is to receive and invest money and disburse the proceeds. In this respect it is like a bank or a trust company. How extravagant the expenses are, from an abstract and ethical point of view, will be seen by estimating the economy of management of a bank in which even an important fraction of one per cent. of the deposits is required to defray its expenses. It was doubtless with a view to gradually lessening expenses that the Mutual, during a number of years, announced that the number of its policyholders would be limited to 100,000 insured lives.

But the actual history of the expense of management of all the companies has been the opposite of these anticipations. Instead of diminishing as the business was enlarged and extended, it has been continually growing. To state the situation from the most charitable point of view, the management of the companies, desiring the greatest possible enlargement of their business, found that they could do this more effectively by expending a portion of their surplus in organized efforts through agents than by returning it to the policyholders. When the number of lives insured in the "Mutual" approached the limit, the latter was removed, and no restrictions placed upon the growth of the company. The great "life-insurance interest" claimed recognition, both from the public and from the State governments, with the power that money always wields. Had this "interest" been solely that of the million or more of men who held life-insurance policies, it would have been legitimate; but practically the interest is that of life-insurance agents and managers, whose function it is to promote life insurance among the people.

Competition between the great companies to show the public the greatest possible accumulation of assets constantly grew. At as early a date as 1870 the area of the United States was found too small to satisfy ambition, and several of the larger companies began to establish agencies in Europe, and we know not what other continents. The great increase in the ratio of expenses was probably due as much to this extension as to any other cause. An American company is naturally at a disadvantage in seeking for foreign support. Now that the rate of interest here is as low as in any other country, an American company cannot offer a foreigner any sound inducement to prefer it to a home company, and it is perfectly natural that one should intrust the interests of his family to the latter rather than to a foreign custodian. It is an example of the small amount of critical attention given to the subject by the public and its supervising authorities that the companies are not called upon for a separate statement of the expenses of managing their foreign agencies. If this were the case, it might explain the growth of the expenses since the beginning of the extension. The expenses of managing several of the largest competing companies have ranged from 15 to 20 per cent. of their entire annual receipts for several years past, or double the percentage forty or fifty years ago. We believe that only a few unambitious and conservative companies have kept their expenses down to even 10 per cent.

Another fact that has been brought to light by the Equitable controversy, and of which the public has probably never been conscious, is the seeming absence of any legal check upon the expenditures of the companies. There is, indeed, a law providing that a certain reserve must be held, sufficient to insure the fulfilment of the obligations to policyholders; but this amounts only to providing that the officers of no company shall squander more than 40 per cent. of the premiums they receive. The public has relied upon this restriction as a sufficient safeguard, quite unaware that, from the beginning of our life companies until the present time, 60 per cent. of the premiums received, expenses apart, safely invested at the ordinary rates of interest, would have sufficed to pay all claims of the policyholders and also to keep the reserve well above its legal limit. Apart from this restriction, which is wholesome so far as it goes, the law recognizes no distinction between a life-insurance company and other associations of men at liberty to manage their business in their own way. In theory the policyholders have the entire power of enforcing economy in their own hands; but in practice they are powerless. In theory they hold an annual meeting; practically, we do not recall any published account of the proceedings of such a meeting or of the conclusions reached at it. Still nearer the base of the entire difficulty is the great fact that the masses of men who can be induced by agents to insure their lives, do not understand with sufficient clearness that the expenses of managing any company in which they insure will really come out of their pockets. No man should insure his life until he has made a personal examination of the insurance reports and learned what fraction of his premium is to be invested for his benefit. It should be to the profit and not to the disadvantage of a company that it reduces the expenses of its agencies to the necessary minimum. But this will not come about until the public take more interest in the subject than it now does. The case now so prominent in the public sight should bring this about. We sincerely hope that individuals and associations who take an unselfish interest in the management of public affairs will not allow the occasion to pass without enforcing a new departure in the whole system.

AIDS TO EDUCATION IN MODERN GREECE.

The fruitful work accomplished some eighty years ago by Americans active in the first organization of public instruction in Greece, invests with special interest for us the annually growing activities of the Society for the Dissemination of Useful Books in that country. During the recent Archæological Congress at Athens were given, in the rooms of this Society, several popular lectures which attracted much attention, notably that by M. Maspero on education in ancient Egypt. Recently, also, the Society has begun a new series of books for children, including a translation of Hans Andersen's tales. Founded by means of individual contributions and on the initiative of M. Demetrius Bikelas, its president, the first work undertaken by the Society, as far back as 1899, was the monthly issue of booklets—primers of astronomy, botany, physiology; single chapters that allowed of being taken separately out of standard books, such as the account of Tierra del Fuego in Darwin's 'Journal of a Voyage,' geographical and historical sketches of Italy, Sweden, and the like; little handbooks for the cultivation of bees, for the preservation of health, and so on. These monthly books have now reached the figure of about seventy. Their price, which does not cover their cost, is so low that they have been eagerly bought by the poorest people, not only in Greece, but in all Greek-speaking regions—Crete, Cyprus, Macedonia, and various parts of Asia Minor and elsewhere within the Turkish domain. The humors of Turkish censorship have often intervened more or less whimsically, as recently, when the primer of agriculture was seized because, in the account given of the queen bee, there was a passage dangerous to the safety of Abdul Hamid, inasmuch as regicide was its theme. In spite of all such difficulties and discouragements upwards of 600,000 booklets have so far been distributed. The modern Greek adopted in these publications is not fashioned upon any preconceived theory

except that it should be "understanded of the people," and that it is so "understanded" is proved not only by this enormous circulation, but also by the fact that the booklets have been in great demand for use among convalescents in hospitals. This side of the Society's usefulness, indeed, has enlisted on its behalf the interest of its royal patroness, the Crown Princess Sophia, who has an especial care for the management of hospitals in Greece.

The Society has not, however, confined its usefulness to issuing these publications. The Ministry of Public Education in Greece entrusted it, upon representations made by its president and council, with the organization of small libraries in connection with primary schools in Greece. The royal decree of authorization is dated November 30, 1901, and very encouraging progress has already been made in the formation of these libraries, intended for the use not only of teachers and pupils in the schools, but also for that of the people of each neighborhood. The Ministry of Public Education further called upon the Society to prepare and submit a report on the teaching materials and school appurtenances best adapted to be used in Greek schools. The result has been a carefully considered list of articles procurable through the Society from various European makers. As for diagrams necessary in teaching the elements of geography, anatomy, antiquities and the like, these could not be had with the indispensable Greek explanatory text unless a special arrangement, involving the expense of printing, was entered into. One of the recent successes of the Society has been the contribution by three members of a fund for this specific purpose. Accordingly, useful diagrams for teaching purposes are in process of preparation and will soon be available for use in the schools of Greece and the Levant. This is one more example of the generosity upon which the Society for the Dissemination of Useful Books has had constantly to depend in order to make good the yearly deficits caused by the intentionally low price of its publications. The annual subscriptions of about 170 members, and the payments made by 80 life members, constitute its sole regular income over and above what is paid for its books. Not only members, but also the Government, have helped it from time to time with donations.

These new facilities thus afforded for supplying Greek schools with diagrams and for facilitating the acquisition of school supplies of all kinds, are the culmination of a line of action instituted by the Society in 1903. At that time two other Athenian societies were induced to coöperate with its president and council in calling together at Athens a Hellenic Congress of Education. In connection with this congress was held an educational exhibition. The delegates, representing all Greek-speaking islands and countries of the Levant, numbered 996, and, when assembled, voted, on the motion of Mr. George Drosinis, Secretary to the Society for the Dissemination of Useful Books, the formation of an Educational League, whose statutes were sanctioned by royal decree under date of July 19, 1904. Many foreign publishers and societies sent exhibits to the educational exhibition, and not a few of the exhibitors gave what they sent to the Educational Museum which grew out of the exhibition. Additional rooms to accommodate it were built onto the house occupied by M. Bikelas's Society, and the Museum is now so incorporated that, in case of the lapse of its present management, articles contained in it cannot lawfully be sold, but must be handed over to the University of Athens. The beginnings of this Museum date back to 1903, when a member of the Society contributed enough to form the nucleus of what is now an exceptionally interesting and instructive collection. Its present completeness was attained only in January of the present year.

CHURCH AND STATE IN MEXICO.

MEXICO, June, 1905.

Just now, when France is passing through the agitation incident to the religious associations law and kindred measures, amounting in part to a proscription of the Roman Catholic Church as it has hitherto been constituted in that country, a résumé of the results of Governmental proscription of the Church in Mexico on a scale and in a manner comparable only to the anti-clerical measures of the French Revolution, may prove of interest. In Mexico, though the laws of "the Reform" remain upon the books, there has been a steady growth toward real religious toleration in the last quarter-century; and, with occasional incidents which reveal the existence still of the spirit of the old régime, the problem is gradually working itself out.

The contest for the independence of Mexico in the second decade of the nineteenth century was in part an anti-clerical movement, just as, in all the possessions of Spain and in Spain itself, the nineteenth century ushered in a propaganda against Church domination in government. The fact that the "cry of independence," which is annually celebrated by Mexico as its chief national holiday, was uttered before a small band of his parishioners by a priest, Hidalgo, at nearly the hour of midnight on September 10, 1810, though on the surface contradicting the foregoing statement, really confirms it. There were associated with the movement for independence certain of the native priests of Mexico, in part of Spanish blood, who desired to shake off the yoke of foreign clerical domination (which was in large part the rule by Spanish friars, who obtained the chief ecclesiastical preferments, including bishoprics), and who found their best opportunity in a movement for political independence.

The independence of Mexico was achieved only to result in the proclamation of an empire, that of Iturbide. During the thirty-five years which followed, the disastrous dominance of Santa Ana stands out foremost, and the whole period is characterized mainly by the clash of personal ambitions. Nevertheless, underneath may be traced the contest between clericalism and liberalism, which is but another way of saying reaction and reform, if both are understood in an extreme sense. The Constitutional party of 1854-1857, which was but another aspect of the liberal movement, provided (in the Constitution of 1857, still in force in Mexico with various amendments and additions) that "the law cannot authorize any contract having for its object the loss or irrevocable sacrifice of the liberty of man, whether based on labor, education, or a religious vow." Besides forbidding forced labor, this article aimed, though rather covertly, as appears, at breaking up religious associations, which were forbidden to hold real estate except for places of worship. The abolition of special tribunals and the privilege of being judged by special courts (meaning ecclesiastical, though not so stating) was another phase of this rather cautious procedure for the abolition of a State Church, while very wide discretion in this direction was conferred by the provision that the Federal authorities alone should exercise, "in matters of religious worship, the intervention prescribed by the laws."

There soon ensued the French intervention and the establishment of the so-called Empire, which, under its purely Mexican aspect, was a triumph for the reactionary and clerical party—a party which, so far as regarded the adhesion of the sons of the country, had stood first for Spanish rule, then for such foreign or quasi-foreign control as would bring about the overthrow of their liberal rivals. With the withdrawal of the French and the return of the Liberals to power, the anti-clerical movement assumed a bolder phase. Under President Lerdo de Tejada, in 1873, the Constitution was amended to provide explicitly for the separation of Church and State and their mutual independence of each other; for the establishment of civil marriage and registry; for the abolition of the religious oath in giving testimony. Finally, it provided explicitly that "the law does not recognize monastic orders, nor can it permit their establishment, whatever be their denomination or the object which they proclaim themselves to seek." The following year these amendments were greatly expanded by a law dealing with all the subjects in question, reaffirming liberty of worship and the mutual independence of State and Church, but basing upon the clause of the Constitution giving the Government power, in the interest of public order, to interfere and prescribe rules regarding religious worship, some very rigid restrictions upon the Church and its ministers. Religious instruction in the public schools was forbidden, though instruction in morals was enjoined; religious holidays were abolished from the civil calendar, and the participation in them of civil officials or troops forbidden; all religious exercises were confined strictly to the interior of the churches, thus doing away with the gorgeous processions of the former friar régime, and religious exercises even within the church were made the subject of

police inspection and supervision where necessary. The officers of religion, further, were forbidden to wear any habit or distinctive garb outside of the churches; the ringing of the bells was subjected to police supervision and regulation; ministers who had attended dying persons could not receive inheritances from them, and, in general, bequests to religious personages were restricted. The confiscation of the church edifices throughout the country, provided by a law of 1859, which was too short-lived to have much effect, was reënacted, placing title to all such edifices in the Government, which, however, continued to permit them to be employed for worship, as before. Throughout the republic, one will find, in consequence of this law, on the façade of each cathedral, and often on that of other important churches, a large and conspicuous coat-of-arms of the Mexican United States, with the traditional eagle strangling the serpent, one foot resting on the cactus. It is like the inscription on the front of French churches, "Propriété de la République."

With the entry of President Diaz to power in 1876—a rule that has lasted, with one interruption of four years, ever since—stress was soon laid upon the achievement of internal order, and, as subsidiary to this and dependent upon it, the development of the resources of the country, largely through foreign capital, necessitating the guarantee of peace and safety for foreigners. The great object, public order, once fairly achieved, the country entered upon the present era of industrial development. All factions of the populace, and, not least of all, the old propertied class, among whom in large part were numbered the old landed families which remained loyal to the Church and were opponents of reform, have shared in the benefits of this industrial development. To a large extent still the old aristocracy is identified with clericalism, and is secretly, if scarcely ever openly, hostile to the element which, coming in large part from the less aristocratic classes of the population, has seized and held the reins of power. It is through the old aristocracy, which may everywhere be still discerned, that the clergy to-day chiefly retain any hold upon the comparatively small proportion of educated Mexicans. Nevertheless, the very existence of a despotic Government, virtually forbidding the open activity of political parties in order that thus internal revolutions might be prevented, and at the same time fostering progress and development by its policy of maintaining order and protecting capitalistic enterprises, have tended to unite all Mexicans by the bonds of self-interest.

Thus, with the gradual achievement of the aims of the Diaz Administration, some of the harsh restrictions upon the Church have been felt to be not only no longer necessary, but also out of place. To-day, and for some few years past, except in places where the local administration is in charge of officials who might be called "professional Liberals," and who are radical in their anti-clericalism, priests go about the street wearing their full ministerial garb, with virtually no hindrance. The management of Church property—in so far as regards the Church edifices themselves, the residences of the clergy, seminaries, schools, etc.—is not interfered with, though doubtless any attempt once more to acquire landed property not directly devoted to public worship would promptly be stopped. The local police are commonly present at large gatherings in the churches on special days of religious significance; but the abuses incident to the presence of pickpockets in large crowds are sufficient reason for such precautions. The presence in Mexico of members of monastic orders, male and female, is a plain indication of the gradual disappearance of much of the old rancor in these matters. There are no large monastic communities, to be sure, and theoretically community life is not permitted. Nevertheless, here and there, notably in the capital itself, there are friars and nuns, who sometimes even appear on the streets in habit. Some of the friars are to be found in the pulpit, garbed as ordinary priests. In the main, the members of religious orders scattered about the country are devoting themselves to teaching in the Church schools. The rules followed in one seminary for aspirants to the priesthood, which has come under the eye of the writer, are quite notably Jesuitical. In the past few years, some of the brothers and sisters of orders expelled from France have established themselves in Mexico, and either opened schools or engaged their services in connection with Church schools already in existence. There does not appear to be any tendency upon the part of the Government to interfere with these religious, so long as they make no ostentation of their connection with an order nor attempt to establish community life in a way to attract public attention. Just how far this tolerance would go is not a thing that can just now be defined; but the best liberal minds connected with the Administration of to-day seem to think that no danger is threatened from encroachments of this sort upon the old rule.

Many Government adherents in the country, through failure to comprehend the newer issues which have arisen in Mexican public life, still make a rallying cry of anti-clericalism, and fulminate in the press and occasionally in the forum against the traditional "enemies of the Reform." Quite a local sensation was stirred up in one of the States of Mexico a few months ago by the arrest of a priest charged with having instigated a religious procession, wherein banners with religious emblems were carried. It was a very petty incident, and probably in the States presided over by broader-minded administrators it would have been passed over without remark, or with merely a quiet admonition to the Church authorities to keep within the law forbidding religious processions in the streets. So, also, it is quite the accepted custom on the part of local officials of Government to require an unusual and special ringing of the bells of churches on certain of the more important national holidays. As indicated, the ringing of the bells on ordinary or special religious days is regulated by local police restrictions; but on Mexico's Independence Day, for instance, the Government will require all the bells in all the towers to be rung continuously and demonstratively for a full half-hour or more at sunrise and at sunset, also perhaps at noon. It happens sometimes, where the clergy feel the old rancor still, that the sextons and bell-ringers are found missing at the time for such ringing of the bells, and have carried off the belfry keys with them. In one State capital recently these offenders were given short terms in jail for their absent-mindedness. This insistence upon the ringing of the church bells for civil holidays is not quite so petty as it may at first seem. The masses below are highly impressionable, and there may well be something in the policy which proclaims to them that, in spite of their quite general subordination to the clergy in all the ordinary affairs of life, there is in the Government a power able to regulate the Church. It is akin to the policy of parading the troops publicly on national holidays.

As might be expected, the Church has still a greater hold upon the majority of the people of Mexico than has the Government or modern thought, political or social. Among the educated, the Church retains its hold chiefly upon the women, who are quite under the domination and influence of the clergy as a rule, regardless of whether their husbands and fathers are of the Reform party or of the old aristocracy. The men of this educated class, outside of a conspicuous few in whose families close loyalty to the Church has been traditional, and who take an active and prominent part in high mass on Sunday, for instance, are, with some exceptions, indifferent to the Church. Where regard for their women folk or a fear of social criticism does not restrain them, the young and middle-aged generations of educated men in Mexico are free-thinkers, if thinkers at all on matters of religion. But, among the masses, the Church is the really respected power, almost as much as it was under the old régime. Here again it keeps its hold largely through the women; for, especially among the rising middle class of artisans and factory hands, there is notable among the men a feeling of independence of the *padre*. This is not true, however, in the rural districts, on the big ranches, and in those parts of the country which have been little changed as yet by railroads, telegraph, etc. To the masses generally, Holy Week, Christmas time, the day of the Virgin of Guadalupe, and other important religious celebrations, are far greater events in the year's calendar and in the lives of the celebrants than any of the national holidays.

The influence of the more radically minded of the Governmental party in preventing a complete subsidence of the old feeling is not so great as is that of the more intemperate members of the clerical party, both lay and religious. Every now and then some injudicious priest's outbreak in the pulpit is responsible for a revival of the rancor. Still more are the lay editors of the so-called clerical press to blame for a covert, but all the more resented, baiting of the "Reform" bear, with sly sarcasm or adroit misrepresentation of facts such as may still leave them on the safe side of the laws regulating the press (laws that theoretically secure freedom of speech, but practically give the executive authority sweeping jurisdiction). The leading clerical newspaper of Mexico City has of late, in spite of denials from official sources, persisted in spreading the news that the Archbishop of Mexico City, Mons. Alarcon, was to be made by the Vatican "apostolic visitor" (whatever that may

mean), thus absorbing the functions of the apostolic delegate to Mexico (the recent Italian apostolic delegate having departed, probably not to return), with his functions as archbishop. Now Mons. Alarcon was a liberal clergyman at the time of the political reform in Mexico, and it is one of the evidences of wisdom and a spirit of accommodation at the Vatican that he and such as he have been appointed to high ecclesiastical posts in Mexico. Some of the younger bishops of Mexico are men of quite progressive and liberal views; and it is not the less significant that they should have been appointed from one or two of the ecclesiastical centres in the country which still remain most reactionary, though appointed probably rather because of their prominent family and social connections than otherwise. It was the Archbishop of Mexico City himself who issued pastoral decrees in March designed to check some of the abuses that have been long established in Mexico in connection with the observances of Holy Week. The Mexican peasant of to-day, especially in the cities, is not the simple being he once was, and certain celebrations that once may have served their purpose in impressing him in a grossly material way with the importance of the holy days, have degenerated into little more than puppet shows. The burning or hanging in effigy of Judas on Easter Day is a custom frowned upon by the progressive members of the clergy. Holy Thursday, when the host is wont to be exposed on a platform in the centre of the churches, and the faithful are supposed to make pilgrimages to seven or more churches during the day, has become a day for the idly curious to throng the churches. Shows which once may have impressed the unsophisticated peasantry are now becoming mere theatrical spectacles. Hence, Archbishop Alarcon, the fiftieth anniversary of whose priesthood was recently celebrated, addressed all the clergy of his archdiocese as follows:

"For no reason, nor under any circumstance whatever, will the curates, the vicars, or other priests allow the appearance, in the church or in the atrium, of dancers or mimics of the enemies and executioners of Christ, especially at the hour when the divine offices or other religious exercises are celebrated, or when the faithful are practising pious acts of any sort. It is to be particularly borne in mind that the persons who appear to exhibit themselves in the ridiculous garb to which we refer are almost always poor, ignorant people, and for that very reason are to be addressed and treated with persuasive plainness of speech, and with patient zeal, to convince them of the justice of our prohibition."

Such things as this reveal the lines of approximation between the more progressive and tolerant members of the Church and Governmental parties. Hence it is that the harsh restriction of the fifties and seventies directed by the Government against the Church remain in part a dead-letter. The time for their abolition, or for complete toleration of views and practices has not yet arrived; but it would appear that the tendencies are that way.

TAINE'S CORRESPONDENCE, 1870-1871.—I.

PARIS, June 15, 1905.

The third volume of 'H. Taine, sa Vie et sa Correspondance,' is by far the most interesting, not, perhaps, for its psychology, but as an historical document. The first part of the correspondence related chiefly to Taine's youth, his family, his early friends, his studies, his journeys, his literary labors; the third volume begins in 1870, on the eve of the war with Germany. As the editor of the correspondence says: "Taine was coming back from Germany on the 12th of July, 1870, with a preoccupied mind. Brought up in a purely civilian *milieu*, he was ignorant of everything military. He had been for four years an examiner in modern languages for admission to the School of Saint Cry, and, as such, he had had pass before him well-instructed, well-brought-up young men, representative of the good average French youth, but he did not know the chiefs." When the war broke out, with a terrible suddenness, he believed, like most Frenchmen, that our generals would be up to their task, and that the material preparations for the war were complete. He, however, did not underrate Germany, and he thoroughly knew her seriousness and tenacity.

He was living at Chatenay, near Paris, but went to the city almost every day. He was alarmed at the levity of the press, the spectacle of the boulevards, where the boys were screaming "À Berlin!"—by the growing agitation of the disorderly element of the population. After the first defeats, he writes to his mother from Chatenay (August 9, 1870); "You know the sad news; the army is ill commanded. The impression of all the people I have seen is bad; it is probable that the Prussians may come as far as Paris. Many people think that, if the reverses continue, there will be trouble in Paris, perhaps a revolution." He thought for a moment of returning to Paris, and offered himself to the military authorities for the National Guard; his eyesight was so bad that his offer was refused. He took his family to Tours, where he heard the news of the defeat at Sedan and of the capture of the Emperor. He tried on September 17th to reënter Paris, but did not succeed, and had to remain at Tours. He there offered his services to M. de Chaudordy, who acted as Under-Secretary of Foreign Affairs. He wrote two great articles for the English papers, which made no sensation at the time. (They have since been reprinted in his 'Last Essays in Criticism and History'). Their titles were "Public Opinion in Germany, and the Conditions of Peace," and "The Intervention of Neutrals."

When Tours was threatened by the enemy, Taine, having with him some ladies of his family, went to Pau. The climate there was favorable to the persons under his charge, but he was almost without news. We see him there occupied, in the midst of his preoccupations, with putting in order his 'Notes on England.' He had been in Pau fifteen years before, when he wrote his 'Voyage aux Pyrénées.' He writes to his mother: "The sun enters my room in the morning and the valley is green [November 19]; but for me the feeling of the public misfortune is so vivid that I do not really sense the beautiful; I only say to myself that, in other circumstances, I should feel great pleasure in the presence of all these beautiful things." He remained in Pau till the capitulation of Paris, which marked the end of the war, finishing his 'Notes on England.'

"I will write nothing," he says, "of Germany; and the feelings we all experience are such that I don't believe a Frenchman, for ten years, will travel in that country or write of it. It is very probable that on my return I shall write political articles in Paris, notwithstanding my repugnance and my want of preparation. Everybody must now put his hand to the wheel; but words are of so little avail against institutions and the national character. . . . It is clear to me that the Germans want to make of France an Italy like the Italy of Austria between 1815 and 1848—that is to say, a country they can invade at their pleasure and entirely under their hand. Perhaps, by so many miseries and humiliations, we shall be led to organize ourselves as they did in 1813."

His political prophecies were expressed in a letter to his mother, written from Pau on February 12:

"The Assembly is composed almost entirely of moderate men, many Orleanists, some Legitimists, a good number of Republicans of the Cavaignac stripe, some Radicals. In my opinion it will resemble the Chamber of 1848. In my opinion, if there is peace, the chances are for a moderate republic of more or less long duration, which will end without commotion in a constitutional monarchy under the Orléans family. The Reds are discredited in Paris, where it was seen how small their number is. The only danger will be the discontent of about sixty or eighty thousand men of the people, who were gratuitously fed during the siege, and who will find themselves without work and without pay. Are they going to try new *journées de juin?*"

Only the second part of these prophecies was verified; the Chamber was not exactly what Taine thought, and the development which he anticipated did not take place. He was a better prophet when he feared new *journées de juin*. He wrote from Pau on March 6: "I foresee civil war before a year has elapsed." The Commune began before a month had passed. He was writing at the time an article on political suffrage, which he would have in two degrees. "Few nations," he said, "are so remarkable as ours for political incapacity. Those who call themselves Republicans, progressive, are almost all madmen. There are no natural chiefs; the masses oscillate under the totally external influence of interest or of fear. What I am trying to write is an article in favor of the two-degrees suffrage, so as to give leaders to this rabble." His article was absolutely without echo, and was lost in the confusion of events.

On his return, he found his house devastated, and still occupied by Prussian soldiers. He saw Renan, who gave him some articles on the situation to read. He did not much like them. "It is abstract, not very good. He has many ideas, but his conclusion would not be acceptable. Very visibly, he is for the restoration of monarchy and a nobility so as better to imitate Prussia." Taine measured well the exaltation of spirit and the depth of social disorganization produced by the siege of Paris. The spectacle of the French arming themselves against each other during the Commune, under the eyes of the conqueror, was one which he never forgot. Those among us who were witnesses of the event can well understand his feeling of horror. During the days which followed the rising of the 18th of March, which was the beginning of the Commune, he remained in the neighborhood of Paris at his sister's country house, going regularly to Paris till the 3d of April, in order to give his lectures at the École des Beaux-Arts. After

the 4th of April, the lectures had to be given up, and the school was closed. Taine retired once more to Tours, where he waited for the end of the insurrection.

His letters to his wife from the 19th of March to the end of May are mere notes—echoes of such news as could reach him during the period of terror which reigned in Paris. The spectacle of that city evidently gave him the idea of what he described afterwards in his account of the Terror of 1793—what he graphically called "l'anarchie spontanée," the free growth of all the savage passions of mankind.

"The *gâchis* is everywhere, it is a spontaneous dissolution. . . . The cause of the present situation and of the success of the revolt (all the men in revolt belong to the Internationale) is the extraordinary anger of all the ignorant Parisians, even of the enlightened ones, against Trochu, etc., whom they regard as traitors. . . . Many persons believe that this government of unknown men will dissolve in universal contempt. I believe in the employment of force, perhaps in the entrance of the Prussians (March 20)."

The same day, he writes: "My heart is dead within my bosom; it seems to me that I live among madmen. I have lost the feeling of indignation."

Taine wrote almost daily to his wife during the Commune. His letters are very despondent. On March 18:

"Europe might pity us on account of the magnitude of our misfortunes; now she has a right to despise us, and she uses it. No sentiment of the right, an exasperated vanity which directs itself against the chiefs instead of the enemy, Paris as mad and as vile as she has seemed heroic—I say seemed; such is the opinion of my uncle and of cool observers. It is hard to think badly of one's country; it seems to me as if it were question of a near parent, almost of a father, a mother, and, after having judged this parent incapable, I am obliged to find him grotesque, odious, low, absolutely incorrigible, and destined to the prison of criminals or the cell of madmen."

He saw clearly that the insurrection, though it never had a distinct programme, was really Socialistic: "The *bourgeois* exploits us; we must suppress him. There is no superiority, no speciality. I, the workman, am capable, if I wish, of being the head of an enterprise, a magistrate, a general; we have the guns; let us use them, and establish a republic in which workmen like ourselves shall be ministers and presidents." The insurrection was also international. The Commune had among its soldiers many Italians, English, even some Germans, all the devotees of universal anarchy. The anti-clerical character of the Commune was visible from the first. The Commune issued a decree confiscating the property of all congregations, suppressing the budget of the churches recognized by the Concordat. The Communists arrested on April 6 the Archbishop of Paris and the curate of the Madeleine. The letters of Taine, written during the early days of the insurrection, are extremely interesting; they are full of the "petits faits" which Taine always liked to note, and which were so valuable in his eyes for the study of history.

Correspondence.

A COMPARISON.

TO THE EDITOR OF THE NATION:

SIR: Permit me to encroach upon your space for the purpose of calling attention to the manner in which Professor Bagster-Collins has constructed his recent volume, 'The Teaching of German in Secondary Schools' (The Columbia University Press, Macmillan, 1904), out of other books. His method may best be illustrated by a presentation of the relation of the book to an American book easy of access, Hempl's 'German Orthography and Phonology,' which appeared in 1897. At the right, below, is the complete text of three portions of the Bagster-Collins book. At the left are placed the corresponding portions of Hempl's book; these are not always in the order in which they stand in the book, but so arranged as to stand opposite their transcriptions:

HEMPL.

§158. The circumstances under which the German "Literary Language" *(Schriftsprache)* was formed and spread tended to make it, as its name implies, a standard written rather than spoken language. The inhabitants of the various kingdoms and provinces learned to read a common language, but each pronounced it according to his local habit. There was no one great and lasting influence for Germany such as England had in London. §163, . . . if Berlin remains the capital of the Empire, it must ultimately have an importance and influence similar to that long exerted by the speech of London and Paris.

§158. But now that universal education has enlarged the circle, etc., ... Between the members of the higher classes of society of the various towns and districts there is more intercourse, direct and indirect, and hence there is greater uniformity of speech among them.

§159. We cannot but recognize that there is more than one good usage on various points. . . . There is no standard.

§162. The fact is that every province has its provincialisms.

§163. That the speech of Hanover should have gained in England the reputation of being the best German, is not strange. . . . It is now generally recognized that Hanoverian German is in many respects provincial.

. . . one can hear at the North a German that is more bookish, orthographic, and "correct," than that spoken elsewhere.

BAGSTER-COLLINS.

P. 42. The German nation has long had a literary language, but it is a written one, not a spoken. The inhabitants of the different territorial divisions of the German Empire learn to read a common language, but each pronounces it in the manner peculiar to his own locality. In spite of the predominance of Prussia, and the importance that Berlin has assumed as its capital, its influence on pronunciation is not to be compared with that which Paris has exercised in France, and London in England.

With the spread of education and modern intercourse, there is, of course, a strong tendency, especially among the higher classes in the larger towns, towards greater uniformity; still, even to-day, there is considerable divergence between the pronunciation of Northern, Middle, and Southern Germany—a divergence which will long continue to exist.

We shall look in vain for any one place where standard German is spoken, for every province has its provincialisms. Even the pronunciation in Hanover, so long in vogue in England, is in many respects not worthy of imitation. On the whole, however, the most "correct" German, that is, the pronunciation which follows the orthography most closely, is spoken in North Germany. One reason for this is that the native dialect is so very different from the High German of

In the North, where the native dialect differs most strikingly from the literary language, the latter, being practically a foreign tongue, has required and received most careful study in the schools." The prominence of the North in literary and political matters for the past one hundred years has tended to establish the good repute of North German.

§158. Since the establishment of political union in a large part of the German territory, it has been urged that a uniform pronunciation of the standard language ("eine dialektfreie Aussprache") should be striven after.

§160. The stage usage *(Bühnendeutsch)* is the outgrowth of certain schemes of pronunciation constructed for the use of actors by men who had little knowledge of phonetics or the history of the language.

the literary language. In a way, the literary language is a foreign language to the inhabitants of North Germany, it is a book language to them, and so has received more careful study than elsewhere. The influence of Prussia, too, political and literary as the largest state in the Empire, has also tended to bring the language of North Germany into good repute.

[Seven lines, five of which are quoted from Breul.]

For a long time the theatre has accordingly aimed at one pronunciation, free from dialect, for every stage in Germany, the so-called "Bühnendeutsch." The standard was at first set by men who had little or no schooling in phonetics, and consequently not always reliable knowledge.

It would be tedious to follow the treatment of the vowels and consonants in detail, but an exception may be made of *l*.

HEMPL.

§206. The result is that the German *l* has a clear, light sound, and the English *l* a dull, heavy sound. . .

The difference is most striking after a stressed vowel, and in the final syllable *-el*, In making the German *l*. . . the lips are usually opened to the very corners of the mouth.

. . . the front [of the tongue] is convex and leaves but a very thin space between its surface and that of the roof of the mouth. . . the back of the tongue sinks. . . .

In making the English *l*. . . the back of the tongue is raised . . the whole front part of the tongue has a concave form, and thus leaves a large resonance - chamber between the tongue and the roof of the mouth.

BAGSTER-COLLINS.

P. 58. The teacher must bring out the difference between the clear, light sound of the German "l," and the dull, heavy sound of the English "l."

There is a striking difference between the sound of the English "hell" and the German "hell." In the German "l" the lips are open to the very corners of the mouth and are kept more tense.

The tongue, too, is more tense in its action, and usually the back is lowered.

In sounding the English "l," on the contrary, the back of the tongue is raised and there is at the same time a concave lowering of the front part.

It should be observed that there are three or four direct quotations from Hempl's book, mostly on points of trifling importance, and the work is spoken of with praise. But there is nowhere any expression of indebtedness to the book which might be construed as excusing the use that has been made of it.

X.

NEW YORK, June 22, 1905.

LASALLE'S AMOUR.

TO THE EDITOR OF THE NATION:

SIR: My attention has been called to a phrase in my article on Mazzini, published in the *Nation* on June 22, which is considered a misrepresentation. I referred to Ferdinand Lasalle as having been "killed in a duel over a courtesan." It would have been better to have said "over a *woman*," and to have allowed each reader to put what construction he chose on that word. Certainly, Lasalle's notorious amour was sufficiently ambiguous to justify the common belief that it was not Platonic. My purpose in referring to it, however, was to emphasize the fact that the world is too sound to date its moral regeneration from a man like Lasalle, who became entangled and was killed in so ignoble an affair.

WILLIAM ROSCOE THAYER.

MAGNOLIA, MASS., July 2, 1905.

Notes.

'Russia and its Crisis,' by Prof. Paul Milyukoff, will be published in mid-August by the Chicago University Press, which in September will issue 'General Sociology,' by Prof. Albion W. Small.

'To Europe,' a handbook by way of preparation, by Miss H. A. Guerber, is among the fall announcements of Dodd, Mead & Co.

The Research Publication Company, Boston, is about to publish 'Some of the Ancestors and Descendants of Samuel Converse, jr., of Thompson Parish, Killingly, Conn., Major James Convers of Woburn, Mass., Hon. Heman Allen, M. C., of Milton and Burlington, Vt., and Capt. Jonathan Bixby, sr., of Killingly,' compiled and edited in two volumes by Charles Allen Converse. The portrait illustrations will exceed 200.

Dr. Heinrich Spies, Privatdocent in the University of Berlin, has undertaken to complete the 'Altenglische Sprachproben nebst einem Wörterbuch" begun by Eduard Mätzner, and continued by his faithful but now deceased colaborer, Hugo Bielings. The first instalment was published in Berlin as far back as 1872, and the last, closing with the word "misbeleven," in 1900. The letter M will complete the third volume, which is to appear during the present year. Spies proposes to push the dictionary by organizing a company of specialists to gather the materials from N to Z at once. He appeals to all who have done personal work in this line to share in the enterprise, and to confer with him, in Berlin (W., 57 Kurfürstenstrasse 4), in reference to plans and principles.

'The Traveller's Handbook' by Josephine Tozier (Funk & Wagnalls Co.) is one of the most intelligent of its kind. The writer treats a most depressing subject, the details of ocean-travel and of transporting one's self and one's luggage when on the other side, with a thoroughness that proves her long experience. The consecutive reading of her pages, with close scrutiny of all the small and humiliating incidents of travel in Europe, would probably deter any but the heart of iron. We therefore recommend that this excellent little book, designed as it is only for those who have not yet "crossed," should be used for reference only. Our experience of these works is that they are usually read after the event, and that one must buy one's own wisdom and buy it dear. But no one can go wrong in taking to heart the lessons of this manual—its tolerance, its attitude of acceptance of all that makes one so glad to get back from Europe. The pain fades, the joy remains, but any seasoned traveller who turns over these pages will sigh afresh, and nod assent to this unsparing revelation of the creaking machinery of transatlantic travel. Its keynote is struck on the very deck: "Chief among the opportunities within reach of those who cross the ocean is that of the possibility of learning to receive enjoyment from meagre sources, and to find pleasure in simple things." Exactly so; and one of the results of going abroad is that one learns that those "sources" and "things" are to be had very pleasantly at home. We have detected no error worth noticing in the writer's advice to travellers. On page 93, however, we observe that the phrases given for buying a ticket at an English station are "single first" and "double first." They should rather run "first single" and "first return"; nor have we ever heard a time-table called a "folder" in England (p. 97).

Mr. Hamilton Wright Mabie, furnishing a preface to his edition of 'Fairy Tales Every Child Should Know' (Doubleday, Page & Co.), strangely omits to offer any reason for his selection. What, for example, is the peculiar merit of "One Eye, Two Eyes, Three Eyes" that children ought to be familiar with it? We can discover none beyond Mr. Mabie's presumable liking for it. Are careful parents agreed that "Bluebeard," "Little Red Ridinghood," and "The Story of Ali Baba," are wholesome reading for the young? The best excuse for these is, that they have furnished counters of speech for adults which promise to have indefinite currency. Little Red Ridinghood is perhaps as substantial an historical personage as Napoleon, or at least as Tamerlane. But could we not get along without her, as she stands for nothing but simplicity and food for the wolf? The book is handsomely and openly printed, and has a colored frontispiece.

Miss Kate Stephens did an injustice to her volume of essays when she gave them the unattractive title, 'American Thumb-Prints' (Philadelphia: Lippincott). They are written in a good English style, and we have found much in them that is worth recording, especially the characteristics of the University of Hesperus, which we take to mean Kansas, and in which Miss Stephens taught. We regret a certain tone of asperity in "Up-to-date Misogyny" and the "New England Woman"—both subjects that should be touched, if at all, with a light hand. We have met with much ridicule of the New England woman, but never so thorough a dissection as this. Miss Stephens has not left her a single good point. "Her lungs are apt to be weak, waist normal, and hips undersized. . . . She is awkward in movement. . . . As she steps, she knocks her skirt with her knees. . . . More often she toes in than out"; and so on. The only woman of our acquaintance who would answer to every feature of the cruel description from which we have extracted, came, we remember, not from New England at all, but from Kansas, but of course she may have had the fatal New England strain in her blood. We are relieved to learn from Miss Stephens that this phase of the New England woman is dying out—naturally enough, as one of her crimes is that she does not marry. "She is already outnumbered in her own home by women of foreign blood, an ampler physique, . . . and a less exalted ideal of life"; these will certainly marry. But we must say that we do not see why the religion that has consoled the New England spinster should be reckoned among her faults, or why one should write of her as though she were a modern Clytemnestra. "Mayhap in this present decay," says Miss Stephens, "some Moera is punishing that awful crime of self-sufficing ecclesiasticism. Her unproductivity—no matter from what reason, whether from physical necessity or a spirit-searching flight from the wrath of God—has been her death." What an exit for the poor, plain, useful body! In her last essay, "The Plagiarizing Humors of Benjamin Franklin." Miss Stephens shows how Franklin plagiarized Swift.

In a thin volume privately and most tastefully printed by the Merrymount Press, Boston, Dr. James Read Chadwick preserves 'A Brief Sketch of the Life of James Read,' his grandfather. Mr. Read was an eminent Boston merchant and manufacturer (1789-1870), who gave his name to Readville. In 1842 his firm failed for $850,000, and settlement was made with his creditors at 86 cents on the dollar. Free to engage in business again, in the course of two years he had acquired enough to acquit his debt in full, which he did, to the admiration of the merchant princes of Boston, who presented him with a service of plate. This was worthy of being retold by his grandson—more worthy even than George Peabody's saying: "Mr. Read, I want to say that *you* laid the foundation of my future"—by timely credit when the young applicant was penniless, but in sight of a "turnover." The volume is pleasantly illustrated with portraits and facsimiles.

The Smithsonian Institution has done well to print a translation of Dr. A. B. Meyer's 'Studies of the Museums and Kindred Institutions of New York City, Albany, Buffalo, and Chicago, with Notes on Some European Institutions'; first in its annual report for 1893, and also separately. This is a kind of service which seems naturally to fall to foreigners. The "kindred institutions" embrace libraries and universities. More than a fifth of the volume is occupied with the European portion. Plans and views within and without are profusely supplied, and the compact data will prove extremely convenient for reference.

Ranke's 'History of Germany in the Era of the Reformation' still remains the great work upon its subject, and it would be a real service to scholarship to reproduce it in a complete translation, with such reference to later literature as would serve to make the reader acquainted with the vast amount of detailed study that has been given to the period since Ranke's time. Unfortunately, in 'Leopold von Ranke: History of the Reformation, translated by Sarah Austin, and edited by R. A. Johnson' (E. P. Dutton & Co.), we have only a fragmentary translation, and "editing" worthy of the publisher's office-boy,

James J. Robinson's 'Selections from Roman Law' (American Book Co.) illustrates a commendable tendency to widen the field of college interest in classical literature. The passages selected cover a wide range of legal principles, both public and private, and the notes are devoted chiefly to an elucidation of those principles; linguistic and grammatical problems receiving attention only when the thought might otherwise be inaccessible to the advanced college student. A junior or senior course on the basis of this book, if given by an instructor of suitable legal instinct and attainments, should be of great profit to students who expect to be subsequently employed, either practically or theoretically, with problems of law or political science.

'Japanese for Daily Use,' by E. P. Prentys, assisted by K. Sasamoto (New York: William R. Jenkins), is a booklet which will fit the pocket and help the traveller. It is full of real talk, brief, to the point, and wholly free from that exaggeration of honorifics heard on the stage and overworked by novelists and Japanophiles. We have failed to find a misprint in its sixty-three pages. Numbers, money, postal rates, and helps to pronunciation have not been forgotten in this capital manual.

We receive from Lemcke & Buechner the first fascicule of ten (A-Bartholdi) of a small quarto 'Dictionnaire Encyclopédique Illustré' (Paris: Armand Colin), which is worth considering among popular French dictionaries. It is extremely compact, and is set in a type which is not fatal to reference, but would be very trying to read. The illustrations are so numerous that every page boasts one or more—commonly more; and the maps are notably numerous, *e. g.*, French West Africa, Algiers, Tunis, the railroads crossing the Alps, plans of Amsterdam, Athens, etc. There is one fine color print of mushrooms. Brief etymologies are given; dictionary definitions are followed by matter introduced by *Encycl.* Academy furnishes a good example of this.

Mr. J. Horace McFarland discusses in the *Printing Art* for June the "Importance of Education in Printing." He finds it remarkable that, while other branches of technology are studied in schools and special institutions, printing has not received due recognition as a subject for instruction. The result is, he says, that, "with a highly intelligent body of master-printers in America, there are but few who are in any sense fully trained in the art they practise. Very few of us know any history of our ancient art; a few more know, through power of absorption by contact, and not through intelligent study of a body of collected information, its underlying principles." Mr. McFarland wants to see a School of the Graphic Arts established, where the prospective printer may learn both the history and the practice of his art, and, besides, the relation of printing to other arts and sciences, the processes of engraving and lithography, as well as type-making and type-setting. Photography is an art with which a printer must be familiar; electricity is becoming more and more a factor in printing, and its laws should be clearly understood. Nor should the economics of printing be neglected. "To trace the influence of printing with movable types on the world's history will add charm and dignity to the art—and it needs both."

The railway problem in central China is shown by Col. C. C. Manifold, in the *Geographical Journal* for June, to be of the greatest importance. The journey of which he gives an account was undertaken to discover the best railway route from the upper Yang-tze provinces to the sea, and was through a region to the north of that river rarely visited by foreigners. Everywhere were to be seen the evidences of China's awakening. In the large towns he found buildings being erected or set apart for instruction in Western learning. In Szechuen each district town was sending, at the Government expense, three students to Japan to be educated in foreign learning and modern science. With this desire for knowledge commercial progress was linked. Comparatively small places had a foreign trade amounting to several million dollars, while at Chung-ching, the commercial metropolis of Szechuen, the imports for last year were valued at $12,000,000, three-quarters being Indian cotton yarn, a trade which had doubled in two years. Yet, large as are the imports, the exports are far greater, many cargo boats from the interior being broken up and sold as lumber on their arrival at Hankau. At present, communication with the outer world is wholly by the river, which sometimes for months is unnavigable even for junks above Ichang. There is also an enormous local traffic, which is carried on in the most primitive manner. In a large section of Szechuen, the richest province of the empire, with a population of from fifty to sixty millions, intelligent, industrious, and eager to purchase foreign goods, there is not a single road which will admit of a wheeled carriage or draught animals of any sort being used. The chief obstacle to a railway to the sea or a river port is the determination of the provincial authorities that all future railway construction shall be done by Chinese capital and under Chinese management. An official announcement has been made inviting subscriptions on a 4 per cent. guarantee from local magistrates, landowners, and merchants, "and no foreign assistance is to be accepted." But, as a railway under the control of provincial officials, to say nothing of the fact that the ordinary rate of interest in Szechuen is 12½ per cent., would hardly prove a desirable investment, it is obvious that the thirty million dollars asked for will never be subscribed. It should be noted, however, that there are small local railways in other parts of the empire which have been constructed wholly by the Chinese, while locomotives are being made in the Tong-shan workshops.

A landmark in "the educational conquest of the Far East" is the fifth triennial meeting of the Educational Association of China, held at Shanghai, May 17 to 20. Besides social receptions at the American consulate and St. John's College, there were six general exhibits of text-books, books for supplementary reading, industrial school work, selections from the Chinese educational exhibit at St. Louis, and of educational progress in the Philippines, besides one section on Biblical instruction. In addition to the general meetings, with three sessions daily, there were sectional gatherings on primary education, kindergartens, scientific, normal, and industrial training, methods of teaching English and Chinese, medical, sanitary, and educational literature, etc. Such men as Arthur Smith, Young J. Allen, D. Z. Sheffield, W. A. P. Martin, A. P. Parker, and a number of prominent laymen and physicians took part in reading papers, and in the discussions. A notable figure was Tasuke Harada of Kobé, a former student at Yale University, whose contributions on "Japanese Educational Influence in China" and "How to Apply the Japanese Primary School to China" were especially valuable, because it was the general opinion of the conference that the Japanese are to lead in the new education in China. During the session there was issued the Directory of Yale Men in China, 1905, numbering nearly fifty, with a biographical sketch of each. There are six Chinese students in Yale University. Of the non-resident members of the Yale Alumni Association of China, Dr. Yung Wing of the class of '54, in Hartford, heads the list. At the same time, the great illustrated work, in twenty-one volumes, on "Women in All Lands," in preparation for years, was issued from the press by the Diffusion Society, whose recent publications cover a wide range of science and history.

—To McClurg's "Library Reprints of Americana," Dr. R. G. Thwaites contributes a two-volume edition of Lahontan, under the title 'New Voyages to North America.' The text has been reprinted from the English edition of 1703, the title-pages, maps, and illustrations of which are reproduced. In addition to an introduction, notes, and index by the present editor, Mr. V. H. Paltsits of the Lenox Library also furnishes a much-needed bibliography of Lahontan's book. A somewhat archaic appearance is given to the page by the spelling and typography of 1703, but Dr. Thwaites has not gone so far as to reproduce all the misprints and minor inaccuracies of his old translator. As for Lahontan himself, the best which has been said of him comes from the pen of M. Edmond Roy, and was published in the Proceedings of the Royal Society of Canada eleven years ago. The young Gascon baron whose estate had been so far shattered by lawsuits that he had only his sword and enterprise to depend upon, stands out clearly among the picturesque figures of Frontenac's régime, and has infused much of his own personality into his book of adventures. During the first half of the eighteenth century few books of travel, whether relating to America or not, had a more striking success than this; and though the discovery that Lahontan was drawing upon his own southern imagination when he described his trip to the River Long has impaired public confidence in the rest of his narrative, the work as a whole remains a most serviceable supplement to the reports of Recollet and Jesuit. The romance about the River Long is accounted for clearly enough by the fact that Lahontan wrote his book to save himself from dire want, and did not scruple, for the sake of getting purchasers, to place himself as a discoverer in the same class with La Salle. The real significance of his story is that he approaches the life of New France without any special respect for the ecclesiastical influences that were then so strong in the colony. During the period of his residence at Quebec and among the Indians, he was a full-blooded,

adventurous youth of no very high ideals, but endowed with great physical vigor and thoroughly in love with the rough life of the woods. At a later time, when his fortunes were broken and he found it necessary to seek refuge in literature, his discontent with Europe led him to idealize the Indian and anticipate the idyllic strain of Chateaubriand. Making every allowance for the *blague* which as a true Gascon he possessed, it remains that he held a responsible position in New France during a critical period of colonial development, and that he knew the woods well. Dr. Thwaites's editorial notes are similar in quality to those which have accompanied his Jesuit Relations and other works of Western travel. The Introduction, however, contains one or two slips. In referring to Lahontan's letter of appeal to the Marquis de Seignelay (p. xxi.) he has "three hundred crowns," where the text should run "three hundred thousand crowns," while on p. xliv. he refers to Lucian as having been a *Latin* prototype, and calls Nicolas Gueudeville "a Benedictine friar."

—Under the title of 'An Angler's Hours,' we have from the Macmillan Co. a series of papers by H. T. Sheringham, angling editor of the *Field*, all but one of which have seen previous publication in one or another of the English periodicals. Mr. Sheringham wields the pen of a cultured gentleman, displaying no obtrusive traces of the painful criticism suggested by the Horatian motto upon the dedicatory page, "Vir bonus et prudens versus reprehendet inanes," etc. And though he can go into remoter fields than Horace on due occasion, there is in him no tendency whatever to that tiresomely lavish display of erudition which we had occasion to notice, recently, in the anonymous author of 'Super Flumina.' Mr. Sheringham goes to his sport with a nature delicately sensitive to the various charms which the outdoor world offers to the properly attuned angler by the way, and so his book is for the most part over the heads of the many who go forth with no standard of success other than the catching of many fish. He wearies the reader with no exclusive fads of method, does not belong to the self-elevated aristocracy which would restrict the term angler to those who pursue a single species of fish with a single kind of lure, and displays in general a sound sense emphatically commendable. The book cannot pass without exception, however. We follow him readily enough in his semi-apologetic and yet firm assertion that it is no mortal sin to take a trout with an angleworm when for one reason or another you cannot get him with a fly, but we must regard it as an unfortunate aberration of an otherwise good man when we find him with a dark lantern at midnight covering the bottom of the stream with balls of dough, and marking the spot with a piece of paper on the bank, in order to return at daybreak with a campstool and make a catch from the school gathered together in this easy way. There has been new light on the application of ethics to sport since the old Waltonian days, and so genial a member of the brotherhood as Mr. Sheringham should be careful. A slip of the pen is ordinarily not worth the notice of the critic, but the inadvertent substitution of ounces for pounds by an angler, in speaking of the weight of fish, is so contrary to precedent and probability as to deserve rank among the curiosities of literature. Possibly it was a deep-laid plot of Mr. Sheringham to gain credit for certain other statements, as of the irate angler who waded out to a monster trout which refused to rise, and kicked it in the side for its insolent imperturbability.

—The dramatic critic, and, in fact, any sort of critic, if he expects to be read, must be cocksure. He should not qualify his verdict with saving-clauses, with "I think" or "At least it seems so to me." He should not mention that he has not read this and that play of the dramatist whom he sets out to estimate, or confess that he has been less fortunate than others in opportunities of seeing those plays on the stage. He may be sure that his reader will have his first impulse to lay down the book when he encounters such misplaced honesty. Above all is the academic critic called upon to be definite, to have all his facts in order, or at least assume them by the divination which is the privilege of the well informed. An amiable and quite unacademic vagueness is, however ,the chief characteristic of Mr. E. E. Hale, jr.'s, 'Dramatists of To-day' (Henry Holt & Co.). "I remain," he says (p. 4), "on an isthmus of a middle state. Somewhere about halfway between the holy mountain and the abyss do I mount beside the puppet booth and give, as though a barker, some comment on the dramatists of our day." Mr. Hale reviews after his fashion the typical plays of seven modern dramatists, English and Continental, and he is, throughout, essentially incoherent.. "And in Wildenbruch there is doubtless," he writes, "something too (only I can never quite get at it), which brings out by contrast the qualities of Sudermann" (p. 64). "It takes time to tell these complicated things," he says of Pinero's "Letty," and he certainly has described the play so as to make even *Letty* seem complicated. "It may be that the novelist, who must work so much by description where the dramatist can work by presentation, the temptation is to confine oneself" (p. 74)—Mr. Hale must have left out something that would have made sense of this conjecture. His English style leaves much to be improved. Dilettantism is sometimes excusable in a critic, but in a serious volume of essays there is no excuse for such a sentence as "they compromised, as a rule, by having their heroes chumps" (p. 25), or for the inelegance of "You will best get at them when they are not dead set on some special object" (p. 106). "I will confess," writes Mr. Hale of a scene in "Magda," "that I hardly know whether all this is precisely what one would call dramatic." We have chosen to dwell on the manner rather than the substance of Mr. Hale's book because his essays are precisely what one would *not* call dramatic criticism.

—Having been sorely tried of late by abridged and adapted memoirs of the French Revolution, we find it a relief to meet with a new work on this period which deserves the printing. In his 'Select Documents Illustrative of the History of the French Revolution' (Frowde), Mr. L. G. Wickham Legg of New College, Oxford, has brought together two volumes of extracts that are well worth the editorial care he has lavished upon them. In France the speeches of the Revolutionary orators are to a certain extent known through the exhaustive 'Histoire Parlementaire' published by MM. Buchez and Roux, and more widely through the selections made by M. Aulard. The English world is enabled to become familiar with this same body of literature in its essentials through the good offices of Prof. H. M. Stephens. The memoirs and correspondence of the political leaders are more accessible still. But what we have lacked hitherto has been a well-chosen body of material which should disclose the feelings and ideas of the masses at successive stages of the movement. The natural channel of such opinion and sentiment was the daily press, and altogether nearly 500 newspapers were published in Paris during the times, less than two years and a half, when the Constituent Assembly was in session. Mr. Legg, searching for the views of the average man, finds them chiefly in such representative sheets as Mirabeau's *Les États Généraux*, Mallet du Pan's *Mercure de France*, Camille Desmoulins's *Révolutions de France et de Brabant*, Brissot's *Patriote Français*, and Marat's *Ami du Peuple*. Although these and the other most representative newspapers were published by party chieftains or lieutenants, they kept in close touch with the popular mood of the moment, each for its own section of the community, and from them can be made out a side of the Revolution which does not find adequate expression in parliamentary debate.

—Mr. Legg, taking up large subjects like the storming of the Bastille, the March to Versailles, the Flight to Varennes, the "Massacre" of the Champ de Mars, etc., gives the newspaper version of the facts with such comment as is represented by leading articles that consider the incidents from typical points of view. We are particularly glad to see that he has made copious use of the *Mercure de France*, a journal which expressed temperate, firm, and enlightened opinions under circumstances of the most trying kind. In selecting his subjects Mr. Legg has thought it best to economize space by denying notice to colonial and foreign affairs. But, while concentrating his attention upon the domestic affairs of France, he does not make Paris overshadow the rest of the country, even though the newspapers from which he draws so largely saw things in the main from a Parisian standpoint. Various official utterances, like the speeches of Louis XVI. and the Bull of Pius VI. on the civil oath of the clergy, are included, as well as important laws like those relating to local government, the judicial organization, and the organization of the ministry. The Constitution of 1791 is also reprinted. We hope that Mr. Legg will in future volumes apply his method of selection to the periods of the Legislative Assembly and the National Convention.

A NEW HISTORY OF ROME IN HER MIDDLE PERIOD.

A History of Rome during the Later Republic and Earlier Principate. By A. H. J. Greenidge, M.A., D.Litt., Tutor and late Fellow of Hertford College, and Lecturer in Ancient History at Brasenose College, Oxford. Volume I. From the Tribunate of Tiberius Gracchus to the

Second Consulship of Marius, B. C., 133-104. With two maps. E. P. Dutton & Co. 1905.

It is quite time that there should appear in our language some new treatment of that history which forms the centre of the history of the ancient world. No British or American scholar has entered the field with any book planned on a large scale since Theodor Mommsen's great work—a work as brilliant as it is learned, but too concise to deal fully with many of the topics it touched—was translated into English. Since that time much has been done to extend our knowledge of Roman things, by no one more than by Mommsen himself; and our way of regarding Rome and her dominion has itself been modified. Accordingly such a book as Dr. Greenidge's deserves a friendly reception when it comes from one who has already shown, by several smaller works, that he possesses both extensive learning and a mastery of critical methods. His treatises on *Infamia* and the Legal Procedure of Cicero's Time relate to highly technical subjects, and could attract but few readers. They show, however, both that he understands Roman law, an indispensable prerequisite to a comprehension of Roman history, and that he is a diligent investigator.

The present volume sustains his reputation for accuracy and penetration, while proving him to possess gifts of a different order. It discloses a large grasp of facts and a weighty style. Dr. Greenidge's writing is always forcible and often pointed, sometimes a little too colloquial for the dignity of the subject, sometimes a little obscure from the concentration of thought, but never tedious or diffuse. His narrative occasionally rises into a high dramatic impressiveness. The story of the career of Tiberius Gracchus, for instance, is given with a vigor which holds the reader's attention from first to last, nor is the shorter description of the Servile war in Sicily inferior in its picturesqueness and in the skill with which the salient incidents are presented. It has become the fashion to contrast the old-fashioned "literary" way of writing history with the new or "scientific" way, and some have gone so far as to say that the scientific method excludes charm, and justifies—perhaps, indeed, prescribes—an austere dulness. Dr. Greenidge belongs to the scientific school in respect of his care and diligence in investigation, and his abstinence from mere embellishments. But his pages have that best sort of interest which belongs to a judicious selection of facts, and to a forcible presentment of them which brings them vividly before the reader's mind, and sets him reflecting upon causes and consequences. His own mind has been moved by the story he tells, and he communicates to us a sense of its tragic meaning.

The chief defect we have to note in the book is the abruptness with which we are set down into the middle of the history of the second century B. C., without any sketch of the preceding, even of the immediately preceding, events, or any outline of the constitution of the Roman Republic. The author, seeing that the course he has taken may be criticised, avows and defends it. He thinks it best simply to assume the earlier history and the form which the constitution had taken to be already known to the reader, and proceeds forthwith to discuss the highly technical questions which arose during the struggle of the two Gracchi against the Senatorial party, upon that assumption, observing that the reader may find in familiar manuals all he needs to know. This is, however, an assumption that cannot safely be made even in the case of scholars and historians, unless they happen to be Roman specialists, nor does one wish to be always referring to some other volume. When another edition is called for, this first volume ought to begin with an introduction sufficient to place the reader abreast of the situation which Rome held in the world, in her relations to the Italian cities, and in her domestic institutions, at the moment when the narrative opens.

That moment is well chosen to indicate the precise department or period of Roman history which Dr. Greenidge means to deal with. It is the Revolutionary Period, which turned Rome from a republic half-oligarchic, half-democratic, into an absolute monarchy. At the beginning of this period nothing seemed more improbable than that the Romans, who hated even the name of a king, should ever submit to the rule of one man. At the end of the period the rule of one man had become so inevitable, so incontestably necessary to the governance of a conquered world, that nobody dreamt of substituting any other system, or even of limiting in any way the power of the ruler. This revolution, perhaps the most momentous in the annals of mankind, was in progress for a century and a half. Dr. Greenidge seems to put the end of it at the accession of Vespasian. Others might put it rather earlier, say at the accession of Tiberius. But about the beginning there can be little doubt. Historians like Velleius Paterculus, of early imperial days, had noted it. That is marked by the agitation raised first by Tiberius Gracchus, and then by his brother Gaius Gracchus. The old constitution then received shocks from which it never recovered; and the intervals of comparative tranquillity that followed served only to usher in convulsions more and more violent. When these took the form of civil wars, the end came.

Mommsen has given, in his vehement and condensed way, a powerful picture of this long struggle, and an analysis of the causes which produced it. Subsequent writers have in the main followed him, though of late years there have been protests against his scornful treatment of Cicero and of Cato the younger, as well as dissents from his glorification of Julius Cæsar. Dr. Greenidge in the main adopts Mommsen's view of the condition of Rome in the second century B. C., and of the Gracchan movement, but he is not a blind disciple or admirer of the great German, and he adds a good many details which bring out more fully the features of the time and the character of the actors. Recognizing the immense part which economic conditions played in causing the movement led by the Gracchi, he very properly begins by describing the social and economic changes which the growth of wealth and the extension of Roman dominion had produced in the citizens and in the sort of life they led. Among these the agricultural situation figures largely, for there had been a great reduction in the number of peasant proprietors, along with the growth of large properties, especially of large ranches or pasture estates, as against the tillage which had been the mainstay of the earlier Romans. While the type of the ordinary citizen was changing by extinction of the old, hard-working, god-fearing, thrifty, solid yeomen, the number of city voters had been swollen by the admission to citizenship of large numbers of freedmen. That vast change in the blood of the Western Mediterranean countries which was produced by the immense influx of slaves from the East and North, and which had already told upon Greece, was now telling on Italy and even more upon Sicily. One of the most terrible events in the second century was the great slave war, which broke out in that island in 135-4 B. C. It is effectively described by Dr. Greenidge, who calls attention to the fact that the great number of slaves who had been imported from Northern Syria, and from Cilicia and other parts of Southern Asia Minor, gave it almost a sort of national character. The revolted slaves organized themselves under capable leaders, chose a king who had the reputation of magical powers, though his military gifts were of small account—his name was Eunus, but he called himself Antiochus and his subjects Syrians—defeated Roman armies, stormed Roman camps, and held control of the centre of the island for many months. Enna, on its precipitous and all but impregnable height, was their capital, and they had another stronghold in Tauromenion (Taormina), now the favorite resort of tourists, for it stands in a wonderful position, commanding a landscape which has for beauty and variety few rivals in the world. They had at one time sixty thousand men in the field, and were not overcome till treachery had put the Romans in possession of Enna and of Taormina.

Concurrently with the depravation of the Roman plebs had gone a parallel depravation of the upper class. Wealth, luxury, and the passion for wealth which luxury induced, had corrupted the senatorial families and not a few of the equestrian order. Office had now become a means of gaining wealth, and, as baser motives came more and more to the front, the ancient sense of civic duty decayed. All this is well set forth with many illustrations from the private life of the rich in the years that followed the overthrow of the Seleucid Antiochus, the conquest of Macedonia, and the capture of Carthage; years in which the extension of Roman dominion had given a stimulus to trade and financial operations, and new forms of indulgence had been learnt from the East. It was these economic and social changes that brought about the Gracchan movement. There was a double discontent among the masses—discontent with their own conditions of life, discontent at seeing how much of the wealth that conquest brought had accrued to the ruling oligarchy, and at seeing also how selfishly the ruling class used it. The Gracchan movement sprang from this discontent, and was justified by it, though partly in its success by revolutionary means, partly in its failure to remove some of the evils it aimed at, that movement accelerated the process which was destroying the republican constitution.

Three chapters of this book (pp. 100 to 276) are devoted to the two Gracchi. They

are extremely interesting, and parts of them are powerfully written. That Dr. Greenidge does not clear up the story and make it completely intelligible to us, is not to be laid against him as blame, for our authorities for the period are mostly late, and on many points scanty. Plutarch (in his Lives of the two Gracchi), Appian, and even Velleius Paterculus, are all compilers writing long after the events. Stray references from authors nearer the time, such as Cicero, and notices from the epitomes of lost books of Livy, serve hardly more to lighten the darkness than to make darkness visible. Nevertheless, while duly allowing for these difficulties, we sometimes feel that Dr. Greenidge might have done a little more to make his own view plain, and, in cases where no positive conclusion can be reached, to set the alternative views and the conditions of the problem more clearly before us. A second criticism may perhaps seem captious. The Gracchan movement has two aspects—the Agrarian, which raises questions primarily economic; the Constitutional, which is concerned with politics. The former at least of these might be illustrated if not elucidated by references to the parallel agrarian problems which other countries have at various times had to solve. Nothing has been a more fertile source of trouble in growing communities than questions relating to land. From the days of the Hebrew prophets and from the days of Solon, land questions have led to complaints, sometimes to civil strife, sometimes to revolutionary projects of legislation. The proposals of the Gracchi and the way in which they were worked out remind us often of troubles and claims that have arisen in Ireland—claims which were dealt with by the British Legislature in 1870 and 1881, and which are not yet altogether settled. Sicily has a land question at this moment. Dr. Greenidge would have given a little more actuality to his treatment of the agrarian laws at Rome had he referred occasionally to the experience of modern countries; for though none of these presents a case quite like that of Rome, the analogies they show are instructive. The picture of Tiberius Gracchus which our author gives is well drawn; and still more striking is that of Gaius, the younger brother. To give a notion of Dr. Greenidge's manner we extract some remarks upon the oratory of Gaius:

"Those who were about [Gaius] Gracchus must soon have seen that the traces of youth were to be found only in his passion, his frankness, his impetuous vigor. No discerning eye could fail to be aware of the cool, calculating intellect which unconsciously used emotion as its mask, of a mind that could map and plan a political campaign in perfect self-confident security, view the country as a whole, and yet master every detail, and then leave the issue of the fight to burning words and passionate appeals. This supreme combination of emotional and artistic gifts, which made Gracchus so irresistible as a leader, was strikingly manifested in his oratory. We are told of the intensity of his mien, the violence of his gestures, the restlessness that forced him to pace the rostra and pluck the toga from his shoulder, of the language that roused his hearers to an almost intolerable tension of pity or indignation. Nature had made him the sublimest, because the most unconscious, of actors: eyes, tone, gesture, all answered the bidding of the magic words. Sometimes the emotion was too highly strung; the words would become coarser, the voice harsher, the faultless sentences would grow confused, until the soft tone of a flute blown by an attendant slave would recall his mind to reason and his voice to its accustomed pitch. . . . Yet the man thus attuned to passion was, what every great orator must be, a painful student of the most delicate of arts. The language of the successful demagogue seldom becomes the study of the schools; yet so it was with Gracchus. The orators of a later age, whose critical appreciation was purer than their practice, could find no better guide to the aspirant for forensic fame than the speeches of the turbulent tribune. Cicero dwells on the fulness and richness of his flow of words, the grandeur and dignity of the expression, the acuteness of the thought. They seemed to some to lack the finishing touch, which is equivalent to saying that with him oratory had not degenerated into rhetoric. The few fragments that survive awaken our wonder, first, for their marvellous simplicity and clearness, then for the dexterous perfection of their form. The balance of the rhythmic clauses never obscures or overloads the sense" (pp. 191-193).

The narrative of the careers of the two Gracchi and of the way they used the tribunate, renews the astonishment which every student of Roman history feels when he watches the working of the constitution, and asks himself how it could possibly have worked. The tribuneship, especially, is an extraordinary institution, hardly to be paralleled in any other country. Nor is anything stranger than the mingling among the Romans of an intense legality with a frequent acquiescence in startling breaches of the law, and a strange impunity accorded to those who had broken it. Perhaps Dr. Greenidge will try, in the next two volumes of his book, to clear up some of the constitutional enigmas which the doings of the Gracchi as tribunes set in so strong a light.

The chief subject of the later chapters is the long war with the Numidian Jugurtha, which revealed two things scarcely known before—the corruptibility of many of the leading men in Rome, and the unsuitability of the Roman army and Roman strategy for irregular warfare in a wild country. The Numidian forces were undisciplined barbarians, who could seldom resist the legionaries in a set fight. But it took many campaigns and some reverses to vanquish them. Such an enemy would in modern times be easily overcome by the superior guns and long-range rifles of a European nation. The difference between civilized man and semi-civilized man is for the purposes of war far greater now than it ever was before. The Romans showed some want of quickness in not sooner apprehending the nature of the problem before them, and this inaptitude reminds one of the British in the beginning of their recent war in South Africa. Was Dr. Greenidge thinking of that war when he wrote: "A war which it is difficult to justify and still more difficult to remember with satisfaction may be the necessary result of a radically unsound system of administration; and the disasters which it entails may be equally the consequences of a military system excellent in itself, but ill-adapted to the circumstances of the country in which the struggle is waged"? (p. 469).

We shall look with curiosity for the remaining volumes of this History, and especially for the next two volumes, which are to bring the narrative down to the death of Julius Cæsar. The wide and accurate knowledge of the authorities which Dr. Greenidge shows, will be particularly valuable in a period where a connected story has to be pieced out of a great many different and sometimes discrepant sources. The period of the early Principate is easier to deal with, and presents us with fewer political as well as fewer personal problems. It has, however, so much importance for all later times as being the period which gave Roman institutions the shape in which they descended to and moulded the new nations of mediæval Europe, that we hope to see our author go forward to the full completion of his task. He may enhance the value of future volumes by prefixing or appending a Chronological Table of Events, and by a short account of the chief original authorities on whom he relies, such as it is now usual to find in books of history. It is not well to appear to write mainly for scholars; for the number of persons seeking to understand Roman history is increasing faster than the number of scholars who can dispense with these simple aids.

RECENT POETRY.

The hopeful promise of 'The Heart of the Road,' Miss Anna Hempstead Branch's first book of verse, is well on the way to fulfilment in her second, 'The Shoes that Danced, and Other Poems' (Houghton, Mifflin & Co.). Miss Branch is still irresistibly a poet of wonder, but her range has widened notably. In the present volume, the variety of form seems to foretell a growing diversity of note. There are sinewy dramatic sketches, meditative monologues, child verses, lyric odes, and fragments of romantic narrative, all marked by fluent, unconventional music, and strong, unconventional phrase. Yet the mood of wonder that underlies all of it is singularly integral. It is as insistent in "The Shoes that Danced," a gay, tragic little drama of Watteau and the French court, as in such a piece as "The Riders," where Miss Branch has employed more of the traditional accessories of romantic glamour. Through all her work is woven the motive of this rather startling stanza of "The Riders":

"Strange times have galloped through my mood!
(Ride, quoth he.)
Old cities dance along my blood!
(Ride, quoth he.)
'Tis Sodom has an adder's tongue—
But oh, what songs has Venice sung!
With piercing Troy have I been stung,
Gomorrah through my heart has swung!
'Twas so with Christ when he was young!
(Ride, quoth he.)"

Yet to what fine poetic use is this motive turned in the following stanzas of one of her lyrics:

"Oh, grieve not, ladies, if at night
Ye wake to feel your beauty going.
It was a web of frail delight,
Inconstant as an April snowing.

Think not the watchful dim despair
Has come to you the first, sweet-hearted!
For oh, the gold in Helen's hair!
And how she cried when that departed!

Perhaps that one that took the most,
That swiftest borrower, wildest spender,
May count, as we would not, the cost—
And grow more true to us and tender. . . .

"Oh, grieve not, Ladies, if at night
Ye wake, to feel the cold December!
Rather recall the early light
And in your loved one's arms, remember."

Not the least hopeful quality of Miss Branch's work is the amount of mind-work that lies back of the wonder. This is perhaps less impressive in the odes, where the thought is sometimes blurred by a little too exuberant fancy, than in a curious

"monologue in regard to heredity" called "The Descendant and the Id." Through the imagination of the Descendant, a very modern sort of person, passes the tragical pageant of his myriad ancestors, and he trembles at the Fate that for modern men and women no longer lowers from the skies, but flows intricately in the blood:

"How strangely woven of their pain and bliss
Is my soul's fabric. I was wrought of this—
Their exquisite and unforgivable kiss.

So of this dual breathing was I made,
Fragile, eternal, wonderful, afraid,
Rapturous, guilty, flaunting, and dismayed,

While their thin laughter echoing in my bone
Reminds me that my flesh is not my own.
Hands off, hands off, and let my soul alone!

I cannot blame them for the deed they did,
Bearing in me the small satiric Id—
The reproachful secret in the pyramid. . . .

In all the woven tissue of my doom
What thread is mine? What thread? Wrapped in a gloom
Strange hands have whirled the pattern from the loom.

And my young dreams of cloud and fire and star,
Of powers and splendors, shining from afar,
Fade from that web where those dim workers are."

At the last, however, the Descendant stands invincibly captain of his soul:

"Apart, above, beneath, within,
I laugh at this vast heritage of sin.
That God that made me armed my soul to win.

Slowly I feel the ancient custom fall
Like shattered rain from off a steady wall,
And great 'I will' is stronger than them all.

For if those hordes that terribly must ride
Drive through my heart and leave their grief inside,
God also wanders there at eventide.

Man from the dust and woman from the bone—
But oh, we were not wrought of these alone!
God with his Heavenly spirit breathed thereon.

Last night the old ancestral pageant came,
Bearing the ancient virtue and the shame.
God, in my hand, had written a New Name."

For all the intellectual energy and sincerity of Miss Branch's work, and its frank preoccupation with the more passionate issues of life, it never ceases to be finely feminine in a certain lurking wistfulness and tenderness in little things. When she has grown still further in artistic grace, and mastered more perfectly the occasional violences of her mood, we shall look to her for still more significant work.

To turn to 'The Fleeing Nymph, and Other Verse,' by Lloyd Mifflin (Small, Maynard & Co.), is to turn from the poetry of inspiration to the poetry of art, from the modern romantic to the modern classic mood. None of the shorter pieces in Mr. Mifflin's volume is very notable. All have the grace that comes from the sparing, delicate use of words; many are picturesque and pleasing in conception; but there is a certain softness of tone in them that is not wholly a pleasant softness. Yet if there is a lack of pith and fibre in Mr. Mifflin's lyrics that makes against the permanence of the impression left by them, his narrative poetry (when the subject is given him, as in the story of Pan and Syrinx, which forms the fable of "The Fleeing Nymph") is, after all, admirable. In "The Fleeing Nymph" he approaches a classic myth not so much with the passionate absorption of the school of Keats as with the more considerate delight of the school of Landor. There is a conscious Tennysonian suavity in his verse that hinders it from ever attaining quite the cool distinction of Landor's; yet the poem as a whole is a fabric of quiet loveliness. The concluding passage, with its subtly interwoven repetends of sound, its pensive, soft-flowing cadence, is a choice example of that species of poetry which charms men by its very remoteness from their business and bosoms:

"But thou, O Syrinx, Later Sweetness, Thou!
If that thou lookest from his doors of pearl,
Return, return to these Ladonian dells,
Through these Ladonian dells return to me—
To me more ardent than that stripling youth
Whose lily-fingers linger on his lyre
In tedious murmurs every eve and morn!

. . . . . .

Lost though she be, yet ever do I note
Her voice within the hollows of my pipe—
My flute that whispers of the Nymph I loved:
And while the twilight lingers in the West,
And croons the bittern in the crimsoned pool;
When airs from out the marshes move the sedge,
Stirring the borders to melodious sighs,
Then, as the darkness gathers and I look
Deep in the dusky reeds, I seem to hear
Her breathings through the gloaming, and to see
Her beauty glimmer like a silver star."

In his volume of 'Odes and Elegies' (George William Browning), Mr. Clinton Scollard shows himself well endowed with a poet's ideality, possessed of a good mastery of difficult metre, and a good command, perhaps a too good command, of poetic diction. If no poem in the book is quite memorable, it is largely because of a lack of the last intensity and vigor of conception. It is none the less pleasant reading for a person fond of the traditional in poetry. How good in their way, despite a certain instability of phrase, are these concluding stanzas of an ode "On a Copy of Keats's Endymion":

"But ah, what mournful memories are mine,
Song-wakened at this lavish summer-tide!
Can I forget that sombre cypress line
By old Rome's ruined wall,
The lonely grave that alien grasses hide,
The deep, pathetic silence shrouding all?
Who would forget? Blest be the song that bears
My soul across aerial seas of space
As wingedly as airy fancy fares!
For now that earth's worn face
The radiant glow of life's renewal wears.
Would I in reverence seek that sacred place,

There would I lay these woven shreds of rhyme
In lieu of scattered heart's-ease and the rose.
Behold how Song has triumphed over Time,
For still his song rings clear,
Though now the century falters to its close
And he has slumbered many a fateful year!
If to the poet's rapt imaginings
Beauty be wed, with love of purpose high,
Despite the cynic and his scornful flings
Song shall not fail and die,
But like the bird that up the azure springs
Still thrill the heart, still fill the listening sky!"

In 'Words for Music,' a "symphonic series," by William Wells Newell (Small, Maynard & Co.), a mild and rather wordy mysticism sometimes bears poetic fruit in verse of a pleasing, gossamer-like tenuity. Mr. Newell is frequently unable to fit the article, whether definite or indefinite, in to his metre. On such occasions he usually leaves it out altogether, to the damage of his poetic style. His verse contains, moreover, many undissolved particles of prose; as in these stanzas from an auspiciously launched lyric:

"From billows haughty approacheth
A ship under press of sail;
She flingeth the spray from her quarter,
And over the wave doth prevail.

Behind, toward horizon, declineth
Another erstwhile as proud;
Look aft where her topsail shineth;
Or only a glimmering cloud?"

At its best, however, as in "Moonlight," fleeting but poetic moods are expressed with a delicate ingenuity:

"The breathing of Ocean
Is peaceful to-night;
The golden Moon bindeth
His bosom with light.

Her glory in heaven
Doth reign and prevail;
Its torches she quencheth
In mystery pale.

The chamber she floodeth
Where calm thou dost lie;
Thy dream be illumined
As water and sky!"

Paul Laurence Dunbar's 'Lyrics of Sunshine and Shadow' (Dodd, Mead & Co.) are more of sunshine than of shadow. Mr. Dunbar's poetic inspiration is slender but sincere. He can on occasion weave in verse the mood of twilight mystery that for the average man passes as the poetry of life, but he is at his best in simple ballad measures, writing of the common joys of health and out-of-doors. There is a pleasurable gusto in "A Boy's Summer Song":

"'Tis fine to play
In the fragrant hay,
And romp on the golden load;
To ride old Jack
To the barn and back,
Or tramp by a shady road.
To pause and drink,
At a mossy brink;
Ah, that is the best of joy,
And so I say
On a summer's day,
What's so fine as being a boy? Ha, Ha!

With line and hook
By a babbling brook,
The fishermen's sport we ply;
And list the song
Of the feathered throng
That flit in the branches nigh.
At last we strip
For a quiet dip;
Ah, that is the best of joy,
For this I say
On a summer's day,
What's so fine as being a boy? Ha, Ha!"

A certain wholesome objectivity and clean virility of expression make Mr. William J. Neidig's 'The First Wardens' (Macmillan), an uncommonly readable first book of verse. Mr. Neidig is particularly good at telling a romantic story, as in his "Mission Carmel", and in intimating a romantic situation, as in his sonnet sequence entitled "A Woman's Ring"; yet there is, withal, a lack of temperament in his work that suggests a lack of real inspiration, and makes the reader wonder whether, for all the cleanness of his metrical workmanship, he might not have done better in prose. Mr. Neidig's quality is nowhere seen to better advantage than in "The King's Fool":

"A Fool it was, and took his Soul
Within his hollowed hands;
He took his Soul and smoothed it calm,
And loosed its strained bands.

'O Soul,' he cried, 'you bear the stain
Of chain-gyves interwove!
Who did this thing?' The Soul replied:
'It was the friend I love.'

'O Soul, you have a flaming brand
Burned on your nakedness!
Who did this thing?' The Soul replied:
'That was a pure caress.

'O Soul, a fissure shows your heart
Like wound of bloody sword!
Who did this thing?' The Soul replied:
'That was a friendly word.'

'O Soul, you shrink within my hand,
I scarce see where you be!
Who did this thing?' The Soul replied:
'A woman pitied me.'

The Fool laid down his Soul and wept,
And knelt him down beside;
He soothed and questioned all the night,—
No soul of him replied."

'The Harem, and Other Poems,' by Aloysius Coll (Badger), turns out upon perusal to be a less startling collection than would appear from its title. Mr. Coll is, indeed, an honest sort of poet. While his work never has the last touch of distinction, whether of form or of substance, and even misses doggerel but narrowly, it does contain both thought and feeling, and it does reveal not only a wide range of reading and an unaffected love of nature, but even something of a vein of humor. Add to these Mr. Coll's rather uncommon metrical fluency, and we have a sheaf of qualities which should go far toward making his work, if not fine poetic art, at any rate popular. Despite its technical faults, his ingenious "October Paradox" is a good specimen of his work:

"All summer long the zephyr wooed the leaf
In vain with pleasing suns and driving storms;
Then sullen came and went, his ardor lost,
His greeting curt, his word a breath of frost—
Red blushed the leaf, and swooned into his arms.

Long summer days I wooed my love in vain,
Flouted to scorn by lake and changing sea;
I met her, brown October in my mood,
Frost in my heart and autumn in my blood—
Straightway she smiled, and gave herself to me.

Since the death of Calverley, we have had no such master of the fine art of parody as Mr. Owen Seaman. His most recent collection, 'A Harvest of Chaff' (Henry Holt & Co.), contains perhaps no single piece quite so witty and memorable as some that have made his earlier volumes delightful. It is, however, in many ways a riper book than any of the others. The humor of it, while quieter, is more subtle, and the phrase and versification of a more finished poetic style. The inclusion in the volume of a handful of admirable elegies encourages the expectation that Mr. Seaman may before long turn the resources of his poetic skill to serious work. However that may be, his humorous verse is not likely soon to be forgotten, especially when it is so good as in these stanzas from "The New Renaissance":

"I saw him in his yearning youth,
Before the change that brought the heart's ache,
A plunger down the wells of Truth,
And sworn to follow Art for Art's sake.
O frost that nips the nascent rose!
O bloom that prematurely blithers!
How could we then foresee the close
Of Andrea del Resarto Smithers?

"The Editor of Brush and Plume,
A man of sound commercial fibre,
Thought Andrea's art might be a boom
And catch the better-class subscriber;
But often, owing to the stress
Of more immediate local matters,
That graphic print would go to press
Without his prancing nymphs and satyrs.

"Then came the sudden Kodak phase,
When Art was shelved for Actualities,
The Living-Types-of-Beauty craze,
Stage Frights and semi-nude banalities;
Back flew the latest masterpiece
Enclosed wtih editorial strictures:
'These contributions now must cease;
No further use for fancy pictures.'

"The blow, although no blood was spilt,
Could hardly fail to wring the withers
Of one so delicately built
As Andrea del Resarto Smithers;
He bowed before the crushing fates,
Then rose again by nice gradations,
And now he does the fashion plates
Published in Woman's Transformations.

" 'Tis true he owns a sumptuous flat
Who once conversed with gods in garrets;
I grant he's growing sleek and fat
On turtle soup and vintage clarets;
But none the less when I recall
The former hopes on which he fasted,
I recognize the moral fall,
The great career untimely blasted."

The 'Later Poems' of John White Chadwick (Houghton, Mifflin & Co.) is a posthumous volume of pathetic interest. Though poetry with Mr. Chadwick was but the occasional pleasure of a life crowded with important work of many kinds, his poetic product was of a ripeness which shows, if not genius, at any rate talent of the first order. Mr. Chadwick had both scholarship and feeling, and in his imagination there ran a strain of natural Wordsworthianism, touched at times with intellectual subtlety, but never departing from an effective simplicity of utterance. The greater part of the pieces in the present volume are occasional hymns or poems, written for celebrations or reunions of divers sorts. None of these, perhaps, has much enduring poetic vitality, but there are other poems, the product of impulse rather than of occasion, such as "A Common Weed," "My Father's Quadrant," or the group of fine sonnets upon national issues, which should have a good chance of life in the anthologies. In none of his pieces, perhaps, is there ampler utterance than in his "Timeo Danaos":

"Art proud, my country, that these mighty ones,
Wearing the jewelled splendor of old days,
Come bringing prodigality of praise
To thee amid thy light of westering suns;
Bidding their blaring trumpets and their guns
Salute thee, late into their crooked ways
Now fallen; to their sorrow and amaze,
Blood of whose hearts the ancient honor runs?

Nay, fear them rather, for they cry with glee,
'She has become as one of us, who gave
All that she had to set a people free:
She wears our image—she that loved the slave!'
Fear them, for there is blood upon their hands,
And on their heads the curse of ruined lands."

'Seléné,' by the Princess Troubetzkoy, better known as Amélie Rives (Harpers), is an interesting experiment in narrative poetry drawn from classic sources. The poem deals chiefly with the compunctions of Seléné between the time of her first sight of Endymion and the time of her yielding to her passion for him. Through the major part of the long piece the Princess has written admirable blank verse. If she has not always been very successful in maintaining the cool, classic note, the poem is none the less interesting to modern sensibilities. We are inclined to think that, in her endeavor to humanize the fable, she has gone too far in making Endymion a kind of idyllic *divorcé*, one who

"had known
The sapping, slow, brain-sucking misery
That falls upon the passionate whom error
Unto the passionless hath bound."

This materializes a little too much the struggle in Seléné's heart between maidenhood and womanhood, and roils the old Latmian idyl without adding perceptibly in compensation to its power over the imagination. The Princess is at her best, perhaps, in the passages of fanciful embroidery wherein, giving the rein to her imagination, she decks her theme with cumulative musical loveliness that recalls, in its delicate unction, the way of the old poets in such matters. When Love, for example, is invoked by Seléné to debate her case with her, he comes in

"a boat
Of thinnest ivory, winged with golden wings,
Wherein the god stood upright, veiled soft
In the warm aura of his loveliness.
Deep and yet delicate the orange haze
Shed from his scattered hair. His own bright wings
Were lightly shut, nor did he guide his boat
Aerial, of grain so fragile fair
That with his radiance from within it glowed
Like to an alabaster vase where through
A rose-gold flame doth glimmer. Slope it came
As though by subtle instinct thus impelled,
Straight to the rock whereon was poised Diana,
Its luminous keel shearing the curdled clouds
That ever froth and melt like noiseless foam
Upon the silent ocean of the air;
Its vans crip rustling, even as autumn leaves,
Made gold by frost, on frosty breezes rustle;
Its wreaths of small, red roses sweeping out
Against the glittering pallor of the waves,
While ever softly showered the petals fine,
In crimson spray about the gleaming prow."

In Mr. Percy Mackaye's tragedy, 'Fenris the Wolf' (Macmillan), we pass to another mythology—that of the North. The play is an uncommonly bold piece of imagination. Fenris the Wolf, son of Odin, troubles the serenity of Heaven with his barkings of defiance, and with his wolfish desire for Freyja, the betrothed of his brother Baldur. In the prologue, Odin ordains that Fenris, Baldur, Freyja, and himself shall leave their heavenly estate and become incarnate in the persons of four mortals. Fenris becomes Egil the Hunter, Baldur assumes the dwarfed and twisted form of his brother Arfi, Freyja of Thordis, a maiden beloved of both Egil and Arfi, while Odin himself enters the body of Ingimund, one of his priests. The action of the play consists in the conversion of the fierce hunter Egil to charity and human love. It concludes with his renunciation of Freyja to Baldur after the latter assumes his old immortal form. In setting and atmosphere the play is highly poetic. The action passes before rune-stones in the northern forest at daybreak or twilight, in prison chambers, and by deep forest pools. Though it closely skirts the borders of the fantastic, it never becomes, at least for a reader who has served his initiation to the music-drama of Wagner, quite fantastic. Mr. Mackaye has made excellent poetic use of his knowledge of Scandinavian poetry. In the recurrent wail of Fenris, for example, how faithful is the reproduction of the cadence and color of the alliterative stave—

"Free me Freyja! Frore am I, frost-bit;
Go we together into greenwood glad!
Mirk under moon-mist mad will meet thee,
Hunt thee from hiding, thy heart-beats hear."

Fenris is the only character who speaks in Scandinavian metre. The others all use blank verse of a nervous, sometimes a little too nervous, quality. As a whole, the play fails a little of tragic impressiveness precisely because of a certain forcing of the note. Mr. Mackaye has a very unusual gift for strong phrase, but at times he lets it become of a somewhat hysterical strength. He has, also, a gift for the strong situation, and he lets this seduce him toward the end into too long a series of strong situations, which gives something of feverishness to the last half of the play, and robs it of the dignity of tragic mat-

ters marching to a single tragic conclusion. It is, nevertheless, a poetic venture, of a sincerity and magnitude for which there can be nothing but admiration. It shows hard work, and, in the lurking symbolism of the taming of Fenris—the subduing, that is, of the wolf in the breast—Mr. Mackaye shows himself capable of endowing an ancient tale with modern meaning; which is, after all, the root of the whole matter.

Shakespeare's London. By Henry Thew Stephenson, Assistant Professor of English, Indiana University. Illustrated. New York: Henry Holt & Co. Pp. vi., 357.

Of all epochs of London history, none can compare in interest with the London of Shakspere, the subject of this book. We say this, not forgetting the claims of the London of Johnson, Burke, Goldsmith, and Reynolds. But the supreme genius of Shakspere invests the London of his day with overwhelming interest. It is strange that in London, where change is so gradual that even in a long life little seems to be altered, the accumulation of changes should be so great that we can only with difficulty form an incomplete mental picture of the London of three hundred years ago, and this although, in the main lines of the streets in central London, London is still mediæval. So it is, however. Fortunately, the era had its historian, John Stow, Merchant Taylor, whose book is, and to the end of time must remain, the chief source of our knowledge of Shakspere's London. Stow, the learned historiographer, whose devoted labors received so poor a recognition in his own day, has the faculty of inspiring something almost of affection in students of his 'Annals and Survey of London.' It is not, therefore, surprising to find that Mr. Stephenson speaks of him in terms of warm appreciation.. He quotes the eulogy of Stow written by his continuator, Edmond Howes, adding for his own part, "Stow hardly needs a word of praise, nor is there need of any insistence on his value as a writer concerning the manners of the Elizabethan age." The Survey of London, he tells us, "is the one book to which all students of the Elizabethan city must go for much of their material." The only exception to be taken to Mr. Stephenson's praise of Stow is when he refers to the superstitious beliefs held by Stow in common with every Elizabethan. The great Queen herself, when on her way to St. Paul's in 1588, did not disdain to receive from an officer of her privy chamber "a Crapon or Toade stone set in gold." A learned book, 'The Mirror of Stones,' tells us that the best kind of Crapon stone, possessed of wondrous virtues, and but rarely found, is that taken out of a dead toad while still panting. Shakspere himself, as we may infer from "Hamlet," "in part believed" that at Christmastide the bird of dawning singeth all night long, and that then no spirit dares stir abroad, no fairy takes, nor witch hath power to harm. There is no reason to doubt that he really believed in witchcraft. Such beliefs were of the time. We confess that, for us, the pages of the old Chronicles, not seldom dull, are brightened by stories of monstrous births of children, calves, and lambs, of great fishes cast ashore—huge monsters of the deep, often with the face of a man. We like to read of "blazing starres," of what they foretold, and of the fulfilment of the portents. We should have but an incomplete picture of the times did these references to strange beliefs not find their place.

Stow is not, indeed, our only direct guide to Shakspere's London. Belonging to this time we have the maps of Norden, the so-called map of Aggas, and the map about fifty years earlier than Norden's in the collection of Braun and Hogenberg. The value of this last map is, perhaps, not yet fully estimated. Mr. Stephenson has supplemented his study of Stow by that of all other available material. He quotes from the old dramatists, from Dekker, Harrison; Taylor, the Water Poet; from Fynes Morrison, and a host of other writers. The preface contains a graceful acknowledgment of assistance given in the libraries of the British Museum and the Guildhall, so we learn that Mr. Stephenson pursued his studies of Shakspere's London on the spot. The result is an excellent summary of great value to lovers of the old city and to students of the Elizabethan period. Mr. Stephenson roams in every quarter of the city; he has chapters on Old St. Paul's, the Water Front, the Tower, the Theatres, on Tavern Life; he guides us through the main streets, as Cheapside, Holborn, and the Strand. Where all is so good, it is almost invidious to mention certain divisions of the book, but perhaps the chapters on the Water Front and Military Companies show in an especial degree research into some of the less-known phases of London life at this time.

We have noted only one or two quite minor points on which we are not sure that Mr. Stephenson is correct. One is the difficult subject of the "bridges" in the Strand and other places. "There were three bridges over the Strand," says Mr. Stephenson, the Strand Bridge, Ivy Bridge, and a third opposite to the end of Essex Street." But were these "bridges" *over* the Strand? Were they not rather in the direction of the length of the street? Stow says: "Then had ye in the high street a fair bridge called Strand Bridge, and under it a lane or way down to the landing-place on the bank of the Thames." These stairs or landing-places were also called "bridges"; in Rocque's map they are marked as Ivy Bridge and Strand Bridge; these names, however, probably did not indicate the locality near which a passenger was landed. From the passage in Stow it seems clear that the "bridge" must have been at right angles to the lane, and therefore in the line of the main street. This is confirmed by a passage in Howes's continuation of Stow's Annals. In this, under date 1614, he says: "At this time the citizens began their new pavement of broad freestone close to their shops" (the footway, the streetway, was paved earlier) "and the taking down of all high causies [causeways] about London, namely in the Strand," etc. It would seem as though these "bridges" foreshadowed, in a way, the elevated railroads of to-day.

Mr. Stephenson speaks of "the grand tour" as existing in the Elizabethan age. But does not the grand tour belong to later times, its records culminating in Childe Harold's Pilgrimage? Foreign travel was indeed common enough among young men of family in Shakspere's day, as we may see from Ascham's 'Schoolmaster.' But Ascham complains that the young men went only to Italy, unlike the godly and excellent learned Englishmen who, when driven out of England, went to Germany.

The printer has occasionally, not methodically, misspelt some names, as, Latimore for Latimer, and one or two others. These little blemishes should be corrected in a new edition which we may confidently look for. The book is worthy to have a much fuller index. The illustrations are particularly well chosen, many of them from prints or views not accessible to the general reader, and the reproductions are excellent. In almost all cases the original of the illustration is mentioned.

Alaska and the Klondike. By John Scudder McLain. McClure, Phillips & Co. 1905. 8vo, pp. xvi., 330. Illustrated.

When the special sub-committee of the Senate Committee on Territories visited Alaska in the summer of 1903, the author obtained permission to accompany the party in an unofficial capacity, and the materials comprised in the present publication were, in their original form, contributed to a Minneapolis newspaper. They have since been revised, and the industrial statistics brought up to include the business operations reported for the season of 1904.

The route taken was the usual one by the inside passage to Skagway, thence to Dawson by rail and river steamer, and down the Yukon to St. Michael. Here the party were met by the revenue cutter *McCulloch*, which took them to Nome, the Seal Islands, Unalashka, Kadiak Island, Valdes, Sitka, Juneau, and back to Seattle. If the progress of a legislative committee, travelling in ten weeks over half as many thousand miles of river, sea, and railway, is not the most efficient mode of getting reliable information as to the nature and resources of a great and varied district, it is at least a tolerably certain way of obtaining the opinions as to their needs held by the population with which the party is brought in contact. These opinions naturally vary, and their fluctuation is well illustrated by the successive chapters in which Mr. McLain endeavors to report them. In matters of fact it is evident he has tried hard to be accurate and impartial; and, to one familiar with the country and conditions, it seems as if he had succeeded very well. Few of his statements can be designated as erroneous, and these are mostly of slight importance.

The author sums up his conclusions by stating that he is persuaded that Alaska is rich in minerals, timber, and fisheries, and he does not fear to include agricultural possibilities—of course, for local consumption; illustrating these by excellent photographs of vegetable products actually raised in the country and seen by him with his own eyes. He tells us that the commerce of Alaska for 1903 amounted to twenty-one million dollars, exclusive of a gold output of about seven millions more. It is officially stated that, since Alaska became American territory, it has exported furs, fish, and gold in about equal values to the amount of one hundred and fifty million dollars; the investments of American capital amount to about twenty-five millions, and the country

has absorbed merchandise from the United States during the same period to a value of nearly one hundred million dollars.

The crying needs of the Territory at present are a properly paid and incorruptible body of officials, especially in the judicial department; better means of transportation to the interior goldfields; and a personal representative on the floor of Congress who is acquainted with the local conditions. If the means of supplying the two latter are beset with difficulty, it is all the more incumbent on Congress to furnish the former; bearing in mind that the conditions warrant a higher rate of pay than is required in a more accessible region, and that the average official, if not paid a just and reasonable salary, will in many cases feel himself ill-treated, and be ready to make up the deficiency in the ways so easy in his position. Two or three small revenue cutters distributed along the coast and cruising regularly within a certain district, the commander being authorized to exercise a police-justice's functions and powers, or to be accompanied by some one in such capacity, these vessels to be at the disposition of the Governor for transportation at any time—would exert a very beneficial influence on the coast population. A qualified surgeon with suitable outfit on each ship might make himself most useful. The distances are rarely appreciated by those unfamiliar with the country, and the Governor at present has no real power, besides being insufficiently remunerated. These things have been said many times, but it seems that only by constant reiteration can any attention be secured. The inefficiency of a republic in the management of colonies has been only too evident in Alaska for more than thirty years. With all the political bias in favor of the "white man," as against his darker brothers, it seems as if the latter have so far monopolized the wisdom and benevolent attention of our national legislature to the almost complete exclusion of the "higher" race.

Mr. McLain's book is profusely illustrated with very good half-tones, many from original photographs, and will doubtless do its part in disseminating much-needed information in regard to our most valuable and yet most neglected colony.

Primitive Traits in Religious Revivals: A Study in Mental and Social Evolution. By Frederick Morgan Davenport, Professor in Sociology at Hamilton College. The Macmillan Co. 1905.

This book is a valuable and highly interesting contribution to the many recent discussions of the place and value of the emotions in moral and religious development. The increasing freedom, in colleges and theological schools, from dogmatic pressure to reach foregone conclusions has resulted in opening to scientific exploration fields of inquiry concerning beliefs and customs which hitherto have been forbidden because sacred territory.

One such fascinating domain is traversed by Professor Davenport in an analysis of the characteristic features of the periodic epidemic outbreaks popularly known as revivals of religion—epidemics which are not peculiar to the Christian Church, but which rather, as our author shows, belong to elements of human nature which are traceable among all sorts of communities the world over. In the presentation of the physical and psychological aspects of a few of the most notable and typical revivals of modern Christianity, in comparison with similar manifestations outside of the Christian Church, Professor Davenport has shown a refreshing freedom from obscurantism and apology, with a frankness of search into the shortcomings of the men and eras dealt with, coexistent with full and tender reverence for the genuine exercise of feeling in its aspirations after nobler ideals and holier living.

The best-known revivals in recent Christian communities which our author passes in review, are those under Edwards in New England and Wesley in Great Britain, in the eighteenth century, the Scotch-Irish awakenings in Kentucky in 1800, and Charles G. Finney's evangelism in the middle of the nineteenth century. With the close of Finney's especial hortatory gatherings and his assumption of the Presidency of Oberlin College, the inflammable era of revivalism practically came to an end. Mr. Moody, while beginning his public services with appeals to the lower susceptibilities of his hearers, eventually assumed much of the attitude of the regular preacher in a pulpit; such effects as he produced of a remarkable sort having been clearly due to certain personal qualities, hypnotic or magnetic, which our author maintains have been the secret of by far the larger part of the success of most professional revivalists. Given the magnetic man and now and then some special social and economic conditions, usually of a depressing character, and the phenomena of an epidemic revival, wholly unaccountable in the peculiar merit or novelty of the matter of the preaching or exhortation, straightway appeared, in former stages of intelligence.

While at the background of these revivals there is the awakened yearning of the soul for communion with the unseen world and a restoration of balance betwixt the imperfect life and the ideal holiness, they are uniformly attended, as they get under way, with purely physical and quasi-pathological manifestations of a violent type, such as catalepsies, swoonings, deliriums, and ecstasies of the imagination. And the bodily convulsions are too often the sole result of the protracted agonizings; the religious motive operating as a means of attaining the delicious intoxication of sensuous rapture, which being exhausted, the workaday life comes back with all its infirmities and sins. To-day the once very familiar and common excitable manifestation of the revival spirit is practically extinct, its chief survival in the United States being with the negroes of the Southern Black Belt.

The coincidence of this disappearance with the spread of general intelligence and of intercommunication between the intellectually backward and the more cultivated communities affords one of the weightiest justifications of the author's account of the physical phenomena, and many of the mental and moral manifestations, as relics of primitive humanity. In the process of his evolution from the animal, man carries with him, even up to a time of civilized life when the habit has lost all value and has become decidedly pernicious, his susceptibility to gusts of irrational passion and spasmodic activity; his nerves are not under control; ignorance of his surroundings in the mystery of nature begets one of the most powerful of influences—fear and its attendant superstitions. In a crowd, especially, where the individual is swallowed up so as to become a fragment of a common mob soul, this ancient nervous instability becomes predominant, and the man ceases to have a will.

One of the most striking illustrations of the essential revival fanaticism in conditions not pretending to be Christian is given in the story of the Ghost Dances which broke out in the Rocky Mountain and Pacific Coast regions in the later eighties. These were not, as is commonly supposed, an outbreak of the war spirit among the Indians, although there was a Sioux uprising contemporaneous with some of these dances. They had chiefly a theological motive, the dream of a near-at-hand Messiah who should restore the united race of Indians, living and dead, to a paradise upon earth from which the white man was to be excluded; and in some cases a moral aim, which involved the abandonment of some of the bloody practices of self-maiming, and especially of the vices of drunkenness and gambling. While there was much that was downright mad and wholly repulsive in the fruits of these dances, there was also, as the Government representative who witnessed many of the frenzies bore sympathetic witness, a genuine emotion of hope of a better time to come for their race, expressed with streaming eyes and bodies trembling with mental distress. Tested by the occasional fruit of a purified morality, some of the extra-Christian congeners of revivals have as valid an evidence of divine inspiration as those of which, in Christian communities, so much has been made, in the reformation of here and there a carless or wicked soul.

The era of the highly emotional type of revivalism, in our author's judgment, is past beyond hope or desirability of return. In a lower stage of culture, when man had the minimum of reason and the maximum of sensuous impulse, appeals to terror had a measure of efficacy, in that they directed minds to higher obligations and realities than those of the time and flesh. Popular religious movements will continue to arise, but they will assume new forms in harmony with the new spirit of sober reflection and mastery of the impulsive nature by the rational will.

Sur la Pierre Blanche. Par Anatole France. Paris: Calmann-Lévy. 1905.

M. France's new book is a medley, but a medley of deep significance, for between its lines may be deciphered the profession of faith of one of the most humane and acute minds of the day. The visit of four French travellers to Rome supplies a thread for observations that embrace the whole of Christian civilization from the earliest times to the present, and even beyond. There is ample fare for all tastes. The classical student will find that these Frenchmen foregather with Giacomo Boni, and even dine with him in a not unknown *osteria* of the Via Condotti. The student of literature may take opportunity to compare M. France's conduct of an imaginary conversation between Gallio and St. Paul with the inimitable felicity of Landor in the same field. The lover of good things

will delight in the constantly sparkling wit of the second half of the book.

In this second half, M. France leaves the ancient world, where he is perhaps not at his happiest, and discourses on matters more *actuel*, even on the Russo-Japanese war. Philosophy and wit lead him by either hand, as the following short extracts may testify:

"Nous avons enseigné aux Japonais le régime capitaliste et la guerre. Ils nous effraient parce qu'ils deviennent semblables à nous. Et vraiment c'est assez horrible. . . . L'empire russe oppose à l'énergie méthodique des Japonais ses forces indéterminées, que comprime l'imbécillité farouche de son gouvernement. . . ."

The book closes with a peep at the year 2270, one more fragment of evidence, if any were needed, that a marked concern for the future of the race is a distinctive feature of modern literature. From the numerous glimpses of his mind that Anatole France affords us in this book may be derived an impression. He may be taken as the spokesman of that small but remarkable group of Frenchmen that represents, in the domain of letters and politics, the idealism of the great Revolution chastened by the vicissitudes of a century, tempered by the experience of thirty years of power, a group that looks forward with enlightened and discreet enthusiasm to an approaching era of real humanity and civilization. One word of criticism, or regret, must be added, that in his knowledge of things American M. France appears to rely on nothing more substantial than boulevard journalism.

READY
A NEW EDITION UP TO DATE
RUSSIA
By Sir Donald Mackenzie Wallace
With two colored maps. $5.00 retail

The first edition of Wallace's Russia was published in 1877, and was at once accepted as the leading authority in English. The author has brought the book up to date, and the present edition, rewritten throughout and enlarged, may now be accepted, as the first one was, for the one work in our language most needed by those who care to understand Russia. While preserving the historical point of view, it presents Russian conditions and relations in their latest phases. Since the book originally appeared, the author has had abundant opportunities of observing the Russian Empire, both from without and within. Not long ago he spent many months in Russia with the express purpose of preparing matter for this revision. Previously he had been for six years an official in Turkey, and for nearly five years private secretary to the Viceroy of India. He was also political officer attending the Czarowitch (now the Emperor Nicholas II.) during his tour in India and Ceylon.

AN EDUCATIONAL DIRECTORY.

I.—*The Nation* stands alone in its field. It has a larger circulation than any other politico-literary journal published in this country, going to all the principal libraries and reading-rooms, and into thousands of families.

II.—The circulation is chiefly among the thinking and well-to-do classes—lawyers, physicians, bankers, and other professional men—and in the homes of cultivated people, where the education of children is a matter of careful consideration.

III.—The School List in *The Nation* has been a representative one for many years. It includes cards of most of the prominent educational institutions everywhere, during the season of school advertising, and a considerable number are inserted in the paper throughout the year.

IV.—The rate is reasonable, and discounts are made on continuous insertions, of which most of the school advertisers avail themselves.

School advertisements are printed in a uniform typography, with the address in the first line, classification being made by States, alphabetically, unless especially ordered displayed on other pages.

Advertising rates, 15 cents an agate line each insertion, with the following discounts: 5 per cent. on 4 insertions, 10 per cent on 8 insertions, 12½ per cent. on 13 insertions, 15 per cent. on 26 insertions, 20 per cent. on 39 insertions, 25 per cent. on 52 insertions.

The *Nation* is sent free while advertisement continues.

Orders may be forwarded through any responsible advertising agency, or directly to

Single numbers, 75 cents, post free.

Subscriptions are booked and single numbers sold by G. E. STECHERT & CO., 129 133 West Twentieth Street, New York; THE INTERNATIONAL NEWS CO., 83 and 85 Duane Street, New York; THE AMERICAN UNITARIAN ASSOCIATION, 25 Beacon Street, Boston. From any good bookseller, or

WILLIAMS & NORGATE, 14 Henrietta St., Covent Garden, London, W. C.

Educational.

CONNECTICUT, Old Lyme.
BOXWOOD MANOR SCHOOL
For Book of Information address,
Miss I. LOUISE TEBBETTS, Prin.

MASSACHUSETTS, Boston.
BOSTON UNIVERSITY Law School.
New features. Address the Dean.
M. M. BIGELOW.

OUTDOOR STUDY ALL WINTER.
English Classical School for Girls. Art, Music, College Certification. ANNA B. ORTON, Prin., Pasadena, Cal.

BETHLEHEM PREPARATORY
SCHOOL, Bethlehem, Pa. Prepares for leading colleges. Catalogue. H. A. FOERING, B.S., Principal.

COÖRDINATE SCHOOLS.
ST. MARGARET'S HALL, San Mateo, Cal,
ELEANOR TEBBETTS, Acting Principal,
BOXWOOD SCHOOL FOR GIRLS, Old Lyme, Conn.
IDA L. TEBBETTS, Acting Principal.
Same courses. Same rates. Same management.
Pupils of either school may spend a year at the other school, for climatic or other reasons, without interruption of studies or disturbance of school discipline, and without added expense except in so far as additional expense is incurred by the journey across Continent. For further information address either school, either principal.

Miss Baldwin's
School for Girls
Preparatory to Bryn Mawr College.
Bryn Mawr, Pa. Within 14 years 189 pupils have entered Bryn Mawr College from this school. Diploma given in both general and college preparatory courses. Fine fireproof stone building. Twenty-five acres of beautiful grounds. For circular, address the Secretary.
FLORENCE BALDWIN, Ph.D., Principal.
JANE L. BROWNELL, A.M., Associate Principal.

LASELL SEMINARY
FOR YOUNG WOMEN, Auburndale, Mass
Lasell has ideas and methods concerning the training of girls that make it an extraordinary school. The hands and the body are trained with the mind. Courses in Domestic Economy and Applied Housekeeping, Lessons in Sewing, Cooking, Dress Cutting, Home Sanitation, Conversation and Walking—all without extra cost. Special advantages in Music and Art. 10 miles from Boston. Write for catalogue.
C. C. BRAGDON, Principal.

Morristown School for Boys Morristown is famous for its healthfulness and beautiful surroundings. Morristown School—a boarding school for boys—has a record for thoroughness in its preparatory work, whether for college, scientific school, or good citizenship. Sports for health and pleasure under unusually good conditions. Trustees: Charles Scribner, President; Rev. Wynant Vanderpool; John I. Waterbury; Carroll Dunham, M.D. Directors: William Boulton, Carroll Willis, T. Quincy Browne, Jr., and Arthur P. Butler, Principals. Francis C. Woodman, Head Master.

Educational.

ROCK RIDGE SCHOOL
For Boys. Location high and dry. Laboratories. Shop for Mechanic Arts, *Strong teachers. Earnest boys.* A new gymnasium with swimming pool. Fits for College, Scientific School and business. Illustrated pamphlet sent free. Please address
Dr. G. R. WHITE, Principal, Wellesley Hills, Mass.

THE BERKELEY STREET SCHOOL
(FORMERLY MISS INGOLS'S)
CAMBRIDGE, MASSACHUSETTS
Will re-open Thursday, September 28, 1905, under the direction of Miss LILLIAN M. MUNGER and Miss CONSTANCE B. WILLISTON

The HIGHLAND MILITARY ACADEMY,
Worcester, Mass. 50th year. The Rt. Rev. Alex. H. Vinton, D.D., LL.D., Springfield, **Visitor.** Says a present patron: "The best investment I have ever made was the placing of my sons in your school." Address
JOSEPH ALDEN SHAW, A.M., HeadMaster

Mrs. L. Chapman and Miss Jones,
Successors to Mrs. Comegys and Miss Bell,
Boarding and Day School for Girls.
For circulars address Miss C. S. JONES.
Chestnut Hill, Philadelphia.

UNIVERSITY OF TORONTO
Associate Professorship of Political Economy
Applications are invited for the position of Associate Professor of Political Economy, particulars regarding which may be obtained from the President of the University. Applications with testimonials must be sent on or before September 15th to the MINISTER OF EDUCATION, Toronto, Canada.

The Nation.

NEW YORK, THURSDAY, JULY 13, 1905.

The Week.

A rich man bewailing the hardships of great wealth is about the most ill-graced of imaginable public instructors, but the President ran him a close second on Friday in lauding Mr. Hay and Mr. Root for preferring the public service to the accumulation of money. There has been something too much of this in the general mouth, but Mr. Roosevelt, as usual, caught up the commonplace and gave it out with redoubled emphasis. Consider the facts. The speaker himself inherited a competence, and has never had to think anxiously of the morrow. Secretary Hay was the possessor of several millions. Mr. Root is a wealthy man. To talk, in such circumstances, as if there were a question of taking vows of poverty in order to serve the State, is absurd. It is just as easy to be mawkish about riches as about poverty, though laments over a beggarly two millions or so are more disgusting than exaggerated outcries about the lot of the poor.

One of the sacrifices, not pecuniary, which Mr. Root will have to make in becoming Secretary of State is of a certain chartered liberty of speech. It will no longer do for him to utter in public a sentiment offensive to a foreign Government. At the farewell dinner to Ambassador Cambon in 1902, so comic at the time, so tragic since, in the light of the Equitable revelations, Mr. Root, who was then Secretary of War and spoke for the Administration, was guilty of an indiscretion almost as blazing as Lord Salisbury's reference to Spain as a "dying nation." The Secretary expressed the pious hope that M. Cambon would, at Madrid, do what was humanly possible to create "a great Latin republican empire on the Continent of Europe, in which the Seine and the Guadalquivir would flow in unison and harmony." That is, he urged the French Ambassador to Spain to do what he could to overthrow the Government to which he was accredited! This may have been intended as a joke, but international jokes are one of the things which a man who becomes Secretary of State must eschew. Seward's famous playing upon the solemnity of the Duke of Newcastle returned to plague him in the anxious days of the *Trent* affair.

President Roosevelt's order of Saturday last, debarring any officer of the army and navy from seeking advancement by means of "recommendation or support" from sources outside of the military or naval service, commendable as it is, is not a new departure. In November, 1901, the President declared the merit rule established in the army by one of those unofficial utterances which have played such an interesting part in his Administration. Lest any should be misled by the informal character of this statement, he followed it up a month later by a declaration in his annual message to Congress, which reads as follows:

> "Every promotion and every detail under the War Department must be made solely with regard to the good of the service, and to the capacity and merit of the man himself. No pressure, political, social, or personal, of any kind will be permitted to exercise the least effect on any question of promotion or detail; and if there is reason to believe that such pressure is exercised at the instigation of the officer concerned, it will be held to militate against him."

A comparison of this proclamation, which was acclaimed by all interested in an army badly debauched by the politics of the McKinley-Alger régime, with the President's latest order, shows that their purport is identical. The declaration of 1901 never was effective. Some officers tried to honor it; some known to us went to the War Department and applied for details without the influence of Senators and Representatives, only to find themselves laughed at by their friends on duty in the Department, and to see the coveted positions dispensed in the same old way; while the award of generalcies has been almost as injudicious and as indefensible as under McKinley. The result has been that the army is, in respect of politics and favoritism, in as bad a state of demoralization as at any time in its history.

Under a new interpretation of the Roosevelt Personnel Law recently made by Attorney-General Moody, no less than fifty-five navy officers, all in the best of health, were retired on their own application on Thursday. It will be remembered that this law was designed to increase the flow of promotion by making a certain number of vacancies in the various grades imperative annually. If deaths and disability or voluntary retirements did not fulfil this number, then a board of rear-admirals retired a certain number of officers of the rank of lieutenant. Mr. Moody read into the law a new meaning—which must have surprised the Congressmen who passed the bill—with the result that fifty-five vacancies in the grade of captain, commander, and lieutenant-commander have been created, each retiring officer receiving the next higher rank on going out, and three-quarters pay of his new grade. Now this will, of course, please the big-navy boomers, who have been pointing out that the Japanese captains are much younger than our own, but it is a new departure for us to create a corps of pensioners, able-bodied, and nearly all in condition to enter business life. For instance, the thirty-eight lieutenant-commanders retired are between the ages of forty-one and forty-nine, presumably; therefore, at the maximum of their physical and mental ability. The United States is now to lose their services and pay them about $2,250 a year for the remainder of their natural lives. In some cases, under recent law, they will be reëmployed with full pay in what is practically active service. But the point is, that we are now following England's example in supporting a leisured class of comparatively young men, who have in some cases served their country only about twenty-five years.

Chairman Shonts of the Panama Canal Commission makes the welcome announcement that haste is hereafter to be made slowly on the Isthmus. Although the statistics of illness which he gives are much less serious than had been expected, and are hardly to be reconciled with the cabled reports, he none the less admits that the actual work of digging must, to a certain extent at least, give way to the sanitation of the canal zone and an improvement in the living conditions of the laborers. The latter are to have better and more hygienic homes, quicker transportation, and more time for recreation, even though considerably less dirt may fly in consequence. All this is very good news to those who wish to see the canal built in the best way possible. But where does it leave those responsible for the work on the canal, from the President down, since it was stolen from Colombia? It is the plainest proof possible that here is a case where the men who "do things" have blundered badly. Going ahead in our efficient American way is all very well, but the man who really accomplishes results surveys his field first and makes all his plans before digging away. The trouble was that the President wanted to show progress at the same time that the work of sanitation and preparation was going on and before the final plans had been adopted. Probably in the end it will be found that the headlong haste of the past year will necessitate a longer period for the completion of the canal than if the whole available force had been used in the work of cleaning up and constructing the necessary barracks, etc.

"Recommended to the mercy of the court," was the addition to its verdict of guilty made by the jury which convicted

Senator Mitchell of Oregon of performing services for a client from which he was debarred by virtue of his office. This may serve to save the aged Senator from going to jail, and may result in his being punished merely by a fine. Undoubtedly there will be great sympathy for Mr. Mitchell in Washington. He merely did what dozens of other Senators and Congressmen are doing all the time. It is a pity that in this case the conviction was secured on what is rather a technical point instead of on the direct issue of fact as to whether Senator Mitchell was or was not one of the land thieves Secretary Hitchcock is prosecuting so relentlessly. None the less, the conviction will do a vast amount of good, besides making a dozen or more Senators tremble in their shoes lest the public have further reasons for seeing in the Senate a resort for law-breakers as well as a "rich man's club." The spectacle of two of their kind, Burton and Mitchell, actually convicted will cause people to rejoice the country over that grafters in high political places are being caught up with. Furthermore, Mitchell's trial has given most valuable insight into the minds of such as he. It has been impossible to convince him that he did wrong; the whole trouble was that Secretary Hitchcock had a grudge of some kind against him and that his law partner betrayed him.

No one will blame Gov. Hoch of Kansas for expressing his keen disappointment at the judicial wrecking of the plans for a State refinery to fight the Standard Oil. He will even have sympathy when he says that, if he had been the Supreme Court, things would have turned out very differently. "If it is not Constitutional," he says with feeling, "it ought to be." The country at large will have to stifle its regret at not seeing the outcome of the great campaign in which the octopus was to be starved to death. One of the mistakes of the framers of the law now set aside was that they dwelt too much on its oil-refinery features and too little on its penitentiary features. This was seen from the very first, however, to be one of the essential weaknesses of the scheme. In order to be legal, the work of refining oil had to be done by convicts. Thus, as fast as the output of oil increased, the demand would inevitably arise for more prisoners. It would never have been possible to expel the Trust entirely except by inciting an epidemic of crime or else putting a large number of innocent men in durance. This thought may provide a little consolation for Kansas in these hours of bitterness.

Senator Depew's testimony before the State Superintendent of Insurance is a most fearful writing of himself down—not, as he himself put it, "a fool," but something more noxious. His account of how he earned his retainer of $20,000 a year was not even "genial"; it was incredibly impudent. He says that he "freely gave advice," though he has done that on all subjects, gratuitously, lo! these many years; shyly admits that he is "a master of corporation law," but puts us on the right track by stating that the money was paid him on account of "the position I had at the bar and *generally*." Everybody knows what is covered up by that word "generally." Mr. Depew was the most successful lobbyist of his day. He had an enormous political pull, and the Equitable management paid him for it just as they paid David B. Hill for his. Calling it a "retainer" deceives no one. What was bought, and what Mr. Depew sold, clearly appears in his own evidence. The Equitable loaned $250,000 to the Depew Improvement Company. A rash appraiser of the State Insurance Department thereupon fixed the value of the property covered by the loan at only $150,000. Then Mr. Depew was appealed to. What was he thinking of to let a Republican official give an Equitable loan such a black eye? So he "wrote a letter" to the Insurance Department asking for a reappraisal. Clearly, that is the kind of thing the Equitable hired him for. And he was not ungrateful. He was responsible for raising young Hyde's salary to $100,000—partly out of "sentiment," he admitted. And when the company got nervous about the loan to the Depew Improvement Company, he genially guaranteed them against loss. Asked whether that guarantee fixed any liability upon him, he blandly replied: 'As a lawyer, I don't think so, and I am informed by the counsel of the receiver that it does not."

John C. Bowdoin has just been convicted in the United States Court of Alabama for holding Raymond Rhoda in peonage. Both the men are white. Therein lies the great significance of the case. It disposes at once of the contention of Senator Bacon, in his argument before the Supreme Court, that the peonage prosecutions were simply part of a policy of race provocation. But here is a white man convicted of holding a white man to servitude, and it is said that it will not long remain the only case of the kind, since the United States District Attorney will prosecute, at the next term of the court, several other white men for holding white men in peonage. Hence it is clear that the law is impartially enforced. It is clear, also, that those patriotic Southern friends and champions of the negro are right who maintain that oppression of the black man is certain to be followed by oppression of the white. Suppressing the negro vote is only a preliminary to stealing elections from the white voters. It is but a step from holding colored men to involuntary labor to doing the same thing for whites. The spectacle of Bowdoin spending a year in jail for the crime of forcing a white man into peonage should be most salutary.

Judge Henry C. Hammond of the Superior Court of Georgia delivered a remarkable address before the Aiken, S. C., Law and Order League on the Fourth of July, in which he vigorously assailed the American habit of carrying pistols, and paid his respects to lynchers. "The concealed pistol," he said, "is strictly an Americanism" which leads "to man-slaying, to social disorder, and national disgrace." He admitted that there was no State in which this vicious practice was more common than in South Carolina, and that it was sufficient defence there for a murderer to assert that his victim put his hand on his hip-pocket. But he rightly dwelt upon the recent restraining laws passed by South Carolina as a very encouraging sign of progress. He declared also that the situation warranted "an amendment of the Constitution, the imposition of a prohibitive license on the manufacture and sale of pistols, or any other step that can drive them from off the earth." On the lynching question the Judge was equally sound, dwelling on the fact that, of the negroes lynched, only a small minority had offended against white women. Judge Hammond deserves the highest praise for saying also that "if we as a people are to survive in the tide of time, we must solve the race question by means of the intellect, not the passions; by justice, not injustice; by righteousness, not sin." We wish that these words might be put into the hands of every Southern juror, editor, and preacher.

Perhaps the most interesting fact regarding last week's announcement of a new $150,000,000 loan to be raised by Japan is the participation of Germany in bringing it out. At the outset of the war, German opinion expressed itself as unfavorably to Japanese credit as to the chances of Japanese victory over Russia. Change of sentiment in the one direction has brought change in the other. When the $150,000,000 Japanese loan of last March was in contemplation, Port Arthur had fallen, Kuropatkin's defeat was near at hand, and the Berlin bankers then first applied for the privilege of floating a Japanese loan. It was refused to them, although, according to general belief, their bid was higher than that of the Anglo-American syndicate to which the issue was awarded. This time, Berlin is permitted to have a share. The incident throws a curious light upon the relations of finance and diplomacy. In particular, it brings up a very odd question, which frequently

arises in these days of keen search by capital for high-grade investment—whether a Government which applies for a loan is asking a favor or conferring one. The answer would depend on circumstances. Bankers are not, for instance, scrambling for the privilege of underwriting new Russian loans, and our own Government had to visit the money market hat in hand during 1894. To some extent, this difference may be caused by the relative dearness or cheapness of the offered loan, as measured by its issue price. There has probably never been a more singular instance of a demand by investors to be allowed to lend than that of 1895, when China issued her loan to pay for the $140,000,000 war indemnity to Japan. The foreign offices of the various European States literally constituted themselves advocates of the special claims to subscription rights which the bankers of their respective countries professed. The dispute over the right to lend to China became fairly acrimonious. In the end it was necessary to divide the loan between England, Germany, France, and Russia.

In the seizure of Saghalien Island, Japan gains by right of conquest what she might have had to pay for under the peace settlement, and also scores the technical advantage of holding a portion of the enemy's territory before the treaty is negotiated. Of course, repeated acts of this kind while the plenipotentiaries are actually en route for Washington would seriously prejudice the whole affair; it is difficult to bargain when every day's dispatches may change the conditions of the transactions. On the other hand, the taking of Saghalien is on a different plane from, say, a general advance in Mantchuria. Since the defeat of Rozhestvensky the island has lain virtually defenceless, and its occupation by the Japanese was certain. Accordingly, its seizure now may fairly count merely as the clearing up of an arrearage, by making the fact of occupation correspond to a long-standing potentiality, and the affair should not necessarily interfere with the peace preliminaries. It does, however, point to the need of an armistice and to the awkwardness of treating for peace while hostilities are in progress.

The passing of the separation bill in France has been so much a matter of course that it will excite rather little interest, and even churchmen will accept the decision with relative equanimity, seeing that the Senate may not find it convenient this session to confirm the Chamber's action. Of the bill itself one may only say that it is more liberal than the preliminary discussion might have indicated. Throughout the debates, such veteran Radicals as Ribot have constantly held before the Chamber the danger of letting regulation of the Church run into oppression; and if these counsels of moderation have had rather little effect on the actual form of the law, they have at least reduced the bitterness of the agitation. The temper of the country on the whole matter has considerably changed, by as much, perhaps, as M. Rouvier's anti-clericalism is at once more perfunctory and more humane than M. Combes's. In the bill as passed, a considerable concession to the vested rights of the churches has been made in pensioning all stipendiary priests under the Concordat. In fact, enlightened Catholics can have but little just grievance against the form of separation except that the tenure of church buildings, which henceforth are to be let to religious societies only on short and terminable leases, becomes insecure, and that illiberal restrictions are put upon the accumulation of parish reserves and endowments. M. Rouvier and M. Briand, the sponsor of the bill, deserve some credit for keeping the measure well this side of persecution.

It was, to say the least, a most discourteous act for the German Chancellor to forbid M. Jaurès to speak in Berlin. The great Socialist orator was to have spoken, on the invitation of the Social Democrats, about the Moroccan dispute. It should be recalled that Jaurès has always advocated peaceful relations with Germany, that he has deprecated the sentiment of revenge for Alsace-Lorraine, and, in particular, that he was the severest critic of M. Delcassé's exclusive policy in the Mediterranean. In short, if Prince Bülow wanted a learned and moderate advocate of his policy of a general diplomatic understanding with France, he could hardly have chosen a better one than Jaurès. One may note, too, that M. Jaurès is one of the most potent Parliamentary figures in France, and that a refusal to hear him will, in the opinion of all moderate Socialists in France, amount very nearly to a national affront. Of course, Prince Bülow's note abounds in expressions of confidence and admiration, and bases the responsibility for his action, not upon any doubt of M. Jaurès's tact, but upon just suspicion of the German Social Democrats. In other words, the exclusion is a kind of œcumenical rebuke to international Socialism in the person of its distinguished representative.

What Germany gains by the adjustment of the Moroccan dispute is chiefly recognition of her standing in European councils. It is unlikely that the international conference which is to be called at Fez will result in any essential change. Europe collectively is by no means anxious to take charge of the African hornets' nest. Control by the European Concert will in the nature of the case be exercised by a delegate, and since England and Spain have already selected France for that duty, and Germany even, by the recent compromise, has admitted the especial interest of France in the premises, there can be but little doubt that the conference will end with France more completely entrenched than ever—as the mandatory of the Powers. Nothing that has been published on the matter fully explains Germany's readiness to go to the brink of war for so slight a matter. It can hardly be believed, for example, that so hazardous a tension was incurred merely on the off chance that a conference might reduce the pretensions of France and some way favor the ulterior ambitions of Germany. And if Germany has pushed the mere punctilio of recognition as a Mediterranean Power to the danger point, it would be a strange departure from her traditionally cautious diplomacy. The cause of German resentment must probably be sought deeper in some definite slight from M. Delcassé, the nature of which has not yet been divulged. As for the actual settlement with France, it is thrice welcome because it ends a most perilous much ado about nothing. Who is the gainer it would be difficult to say. Germany evidently salves her Imperial pride, but France supplies the unction at slight expense, since it is pretty certain that she can control the vote of the Fez Conference in favor of the Anglo-French Agreement.

The elections in Holland which led to the resignation of Prime Minister Kuyper resulted in a complete deadlock. The Liberals have a slight majority in the Chamber, but the Senate is strongly Clerical. Although the Social Democrats have not added to the small number of seats they held, they practically retain the balance of power, not only in the Chamber, but in the country. In Holland a majority is necessary to an election. If it is not secured by any candidate, there is a new contest between the two having the highest number of votes. In the elections of the 18th of June not more than twenty-five Liberals were elected, as against forty-six Ministerialists. The Social Democratic party had an independent candidate in nearly every district. In almost every case the second election was between a Liberal and a Clerical, and the uniform success of the former was due to the fact that the solid vote of the Social Democrats went to the Liberals. Perhaps the most important result of the election is that the danger of a return to protection, which was part of the Kuyper programme, has been averted. The great commercial and manufacturing cities have spoken with no uncertain sound in favor of the free-trade policy.

THE DISSOLVING CABINET.

Secretary Hay's lamented death has served to give the people a rather uncomfortable perception of the state of flux and comparative feebleness to which President Roosevelt's Cabinet has been brought. It would be unfair to say that it rivals the famous "Who-Who" Ministry for its unknown or negligible names; but one cannot but reflect on the great losses and the small gains. Attorney-General Moody has been well thought of for both character and ability, but he, too, is shortly to go. Taft undeniably carries weight. Secretary Shaw is not precisely an extinct volcano, but the lava of deficits and their deficient explanation is thick upon him, and he also is to retire. Of Metcalf and Cortelyou and Bonaparte, it is to be said that they have their reputations all to make in their respective departments. In a word, the Roosevelt Cabinet has to-day an unhappy resemblance to the Balfour Cabinet—it has lost its ablest members, and is making shift to get on with untried men who do not, at a glance, command the confidence of the country.

The importance of "the President's advisers" is peculiarly seen just now. That phrase is often used in a perfunctory sense. It may be true that most Presidents are "advised" to do just what they want to. One detects something too much of this in the advice given President Roosevelt. But if he is the docile, open-minded, and easily persuaded gentleman that Messrs. Root and Hay pictured him in their campaign apologia for him, it is highly desirable that his official family should be able and willing to instruct him in law and policies; while, if he is perhaps a trifle too quick on the trigger, a restraining hand would be even more useful. In a word, without disrespect to the President, the country would wish to see him surrounded with abler and stancher advisers than those who at present sit at the Cabinet table.

It is a very marked and positive quality of advice which a President of Mr. Roosevelt's temperament requires. Too often consultation between chief and Secretaries resembles the small boy's throwing of a ball against a brick wall. His opinions are simply flung back at him. And too many advisers are of the cynical mood of Goethe in saying that he was always ready to give advice, since he knew it would never be taken. A more vigorous and even fighting type of advice is what is needed on the part of Mr. Roosevelt's Cabinet. He has to pass upon vast and intricate questions, involving law and Constitution and international relations, and ought to have at his elbow men who will point out to him the pitfalls lurking for unwary feet. And they should be men prepared to stand or fall by their convictions. They alone can make their influence truly felt, and magnify their office up to the real measure of its power and responsibility. It is well known in Washington, for example, that Mr. Roosevelt was once led to withdraw from a hasty course upon the stout protest of one of his Secretaries that the latter's resignation would promptly follow, with a public explanation of its reasons, unless the President reconsidered his first decision. We think that the real importance of the Cabinet in our system has been clouded of late. A tradition of "loyalty" to the President has grown up, which too much tends to degrade the Secretaries into echoes and adulators. But the truest loyalty of a Cabinet member lies in giving his chief unflinchingly both advice and frequent doses of what it is so hard for President or Czar ever to hear—to say nothing of acting upon it—the plain truth.

One temptation which may assail a man invited by the President to take a seat in the Cabinet he should resolutely beat off. We mean the temptation to think of the office as a stepping-stone to the gratification of political ambition. As a matter of fact, the Cabinet has come to be a poor nursing-mother of Presidents—nearly as much so as the Senate. Time was when the succession from the Department of State to the Presidency was almost established. We have changed all that. For forty-five years, no President has been taken from the Cabinet. Even Mr. Blaine could not break this latter-day precedent. It is said that Mr. Root thinks of attempting to do so—that he gave his assent to becoming Secretary of State upon a tacit understanding that he should be made party candidate for the Presidency in 1908. Supposing this to be true, it would be a mistake in every aspect. If Mr. Root, with his unquestioned ability, were to assume the State Department purely as a public service, with every thought of political reward not only put aside, but explicitly disavowed, his appointment would be hailed as one of high promise. On the contrary, if he were to sacrifice his profitable corporation practice solely out of ambition to become President *via* the Department of State, the result would be bad both for him and for the country. His taking office again would be robbed of that appearance of high disinterestedness which alone could dignify his course; while his acknowledged Presidential candidacy would awaken the gravest suspicions as to the kind of influence he would depend upon for success. Possibly, however, just as the President wanted a man in his Cabinet to explain to him the iniquity of railway rebates by experience and personal practice, so he may now, in his further plans for attacking wicked corporations, desire to have by him a counsellor expert in all their guile.

Mr. Root's acceptance of the State Department will at least make us consider our mercies. Loomis might have been promoted, we might have had Lodge. The new Secretary has ability of the highest order. Moreover, he must be aware that he will be looked to as a steadying force in an Administration too much blown about by every wind of doctrine.

THE DIPLOMACY WE NEED.

In many of the comments on the filling of Secretary Hay's office, there appears a vague and uneasy feeling that somehow American diplomacy must now enter upon a new phase and be of a new sort. Washington's advice on the conduct of foreign relations was well enough in its place, but Washington has been dead a very long time. The living present demands a thoroughly live and up-to-date diplomacy. The ancient ways of a home-keeping republic are made uncouth when practised by a self-conscious world-power. So runs the argument.

Now if this means only that the Secretary of State should be a man of large mould and fine capacity, we heartily agree. His post is one to employ the most substantial powers. It offers a high opportunity for patriotic service. The best men we have are none too good for the Department of State. But this is no new discovery. Jefferson, John Quincy Adams, Webster, Marcy, Seward—such names suggest that even the dull generations which are gone had some faint idea that the Secretary of State might advantageously be a man of the ripest abilities. What is really implied, we fear, in the current talk about the need of a new American diplomacy is that the old was too slow, too scrupulous, too tenacious of good faith, to suit these rapid and resounding days. What seems to be wanted by many is a combination of the devilish sly and the recklessly daring.

It cannot, however, be too firmly and insistently borne in upon us all that the great qualities of the diplomat remain unchanged from age to age. Endow him with natural sagacity; assign him due discretion; enrich him with ample knowledge of the past and such a grasp of principles as will render him prescient of the future; then make him expert in the mere technique of his work, add to him a truly patriotic purpose, frank and clear truthfulness, and give him a steady and matured policy, and you have the sort of man to administer the State Department at any time or under any Administration. The fallacy of novelty should not entrap us in these matters. It is easy for us to think that our situation is something never before seen in the world's history, and therefore that it demands unprecedented methods of treatment. But in reality the possibilities of the political plot are about as limited as those of the dra-

matic, and about as much exhausted. In diplomacy, at all events, each new case simply calls for a fresh application of the old principles; and stainless honor, good faith, considerateness, and a careful observance of the law of nations are as much the armor of the diplomat to-day as they were in Washington's time.

We ought to dread rather than welcome the invention of novel shibboleths in our foreign relations. Mr. Hay himself was not altogether happy in proclaiming that the watchwords of American diplomacy are simply the Golden Rule and the Monroe Doctrine. Looked at close, this means the Golden Rule except in those cases where it is our interest to ignore or defy it. A good part of Secretary Hay's work consisted in protesting against Russia's doing unto us as we were doing to other nations. A Monroe Doctrine in Mantchuria we can at once see to be in glaring contradiction to the Golden Rule; but other Powers see it as clearly in South America. Another thing which every far-sighted Secretary of State will avoid is the construction of "corollaries" to the Monroe Doctrine. Too many of them have been produced in recent years, as out of Pandora's box. Let the Department of State stick to the main theorem, if it must, and shun every suggested "corollary" as it would the plague.

Manner counts immensely in diplomacy; and it is of the highest importance that our foreign affairs should be conducted as between gentlemen. Of course, the more brutal offences of the "shirt-sleeves" epoch will not now be repeated, but a better-mannered period has its temptations. It may not rant or hector, but can easily be fussy, meddlesome, restlessly and needlessly active. In the debate on a Queen's Speech in the 50's, Lord Stanley raised a laugh at Palmerston's expense by affirming that the "increased tranquility," of which the Government boasted, was due to the "increased inactivity of the Foreign Secretary." Diplomacy is, in fact, often most masterly when most inactive. To let things alone may well be the main resolve of a Secretary called to office at a time of great ferment and running after every new thing. And he will be wise also to steer clear of that "spendthrift verbosity" which Lowell found in so many of Seward's dispatches—that introduction of "paper money into diplomacy," which "bewildered Earl Russell and M. Drouyn de Lhuys with a horrible doubt as to the real value of the verbal currency they were obliged to receive."

But it is policy, after all, which dwarfs or determines all the rest; and it is the policy of our Government, in the great questions confronting it, which it is the most pressing business of the State Department to fix. Our indefiniteness is the greatest cause of complaint against us by foreigners in the whole matter of our position in the Orient. "What do you want? What are you going to do?" Those are the questions which they most eagerly ask. They perceive that we talk loudly, but are unable to make out our real meaning. And they cannot understand when they are told that neither our people nor our Government have yet worked out convictions or marked out a policy in all that business. It is a problem to which our diplomacy must immediately attend. We should at once put it beyond all doubt that we have no thought in the East except of peace, no desire for a foot of territory, no interest except equality of trade opportunities.

THE COTTON REPORT SCANDAL.

The nature of the scandal which has just been exposed in the Agricultural Department should fix attention upon the system which made it possible. Among the numerous indefinite and superfluous duties entrusted to that department of the Government, there is one task of great importance—the canvassing of the agricultural districts so as to obtain, each month, as accurate an idea as possible of the acreage, condition, and promise of the growing crops, and the publishing of this information in such shape as can best be understood by the general public. The reason for the work is plain enough. The farmer's management of his business depends very largely upon the size of the crop in the country as a whole. If, in the early planting season, he learns that an exceptionally great amount of land is being sown to one crop, he will be more likely to diversify his own. If he knows, in spring-time, that the country's winter-sown wheat is threatened with failure through bad weather, he will naturally devote particular attention to planting "spring wheat" for himself. At harvest time he can discover what his crop is really worth in market only through knowledge of the country's total production, as compared with other years.

The monthly estimates of the Department's statistical bureau, therefore, are primarily a safeguard to the farmer. They were all the more necessary for this purpose because firms with speculative connections in the markets had adopted a similar plan in their own behalf. Naturally, these "private estimates" were more or less open to suspicion because of such connections. Hence, as the brokers of the Produce and Cotton Exchanges enlarged and perfected their services, the Government was compelled to do the same. A dozen years ago most of the information on which the Department's monthly crop reports were based was gleaned from the farmers' gossip of country post-offices, and transmitted through the postmasters. This source of intelligence proving inadequate and frequently incorrect, larger appropriations were made for the Department, and it established a system of "township correspondents," "county correspondents," and "special field agents," embracing many thousands of experts, largely in the Government's pay. From their returns the monthly crop reports are compiled. They comprise, as published, an early estimate of acreage planted; a statement at the first of each month of the exact percentage of a perfect or average condition which would show the crop's status at the moment; and, at the season's end, an estimate of the crop as actually harvested.

These monthly estimates at once become of even more interest to the speculative markets than to the farmer himself. If the Government's July "condition estimate" on wheat, for instance, shows a heavy decline from that of June, the Produce Exchange buys wheat. On Monday week, when the cotton trade had been expecting a higher "condition percentage" on its staple than was shown a month before, the Government figure reported a slight decline, and the result was a rise of $5 per bale on bidding by the speculators. The motive of speculators, under such circumstances, in getting, if they can, an advance "tip" on the Government's figures, is obvious. The report on the "cotton leak," given out on Saturday by the Secretary of Agriculture, proves that such advance information has been sold to speculators by at least one high official in the Department's statistical bureau.

The question naturally suggested by this development is, how such "leaks" can ever be prevented. It has been declared repeatedly, by the heads of the Department, that they had already been rendered impossible. Secretary Wilson himself wrote to a Senate investigator, three years ago:

> "The position of the Department is absolutely unassailable, since, with regard to the more important crops, no approach to a definite estimate can possibly be made until within one or two hours of the time fixed for its publication."

Mr. Hyde, the chief statistician, who is not alleged to have been in any way connected with the scandal, has given out similar assurances. Both based their confidence on belief that the estimates from the several States were not brought together until the day when the full report was to be compiled and published. The result of the pending investigation proves that the Secretary and his statistical lieutenant were living in a fool's paradise; that, under their very noses, and at the moment when they were reiterating assurances that a "leak" was impossible, the associate statistician, Holmes, was opening field returns in advance of the day for the report, making his own compilation, telegraph-

ing results to New York speculators, and in some cases, it would seem, actually tampering with the figures.

The first conclusion which will be drawn from this revelation is that Holmes's superior officers have been neglecting their duties. Holmes did his work in the most bungling way imaginable, and was manifestly allowed free scope, without adequate surveillance, at the very time when the good faith of the Department's estimates was most seriously questioned. The next and equally obvious conclusion is that the methods of compiling the reports must be reformed, in the direction of absolutely safeguarding their secrecy. Secretary Wilson has issued an order—very belated, all things considered—in which he requires that important field reports shall be sent to him personally, and shall be kept by him sealed and in his safe until the day for their compilation. Precautions like these are absolutely necessary; but it is imperative also that the investigation which has unearthed Holmes, should be continued. A question of very considerable importance is whether the Government's own field agents have allowed themselves to provide duplicate information to the speculators. The suggestion, made in some quarters, that detailed estimates be abandoned and the Department's reports confined to general information as to the state of things, is more doubtful. It must be remembered that, if the Government were to abandon "condition estimates," it would leave the field to the "special experts" who have turned out as a rule, in past years, to have been merely clever agents of the speculators.

THE PUBLIC AND THE EXPRESS COMPANIES.

Every shipper of goods, on however small a scale, is constantly being called upon to decide the question, "Shall I send this parcel by express or freight?" In every-day life these, with the post-office, appear in the rôle of competitors for private custom, one offering cheapness to offset the other's quickness and convenience. It is, therefore, remarkable that at a time when the fairness of freight rates as fixed by private agencies has furnished one of the chief topics of political discussion, so little interest should be taken in the express service. In the July number of the *Atlantic Monthly*, Prof. Frank Haigh Dixon brings together, as he says, "such information as can be gathered from existing sources" regarding the express business. The most striking thing about this compilation is the extraordinary meagreness of the data now available.

"Nothing is known of the amount of money invested in the business, or of the expense of conducting it," says Mr. Dixon. "Only in a few individual instances, under pressure from investigating bodies, have the contracts with the railways been made public. We know that under their contracts the express companies paid the railway companies for the year ending June 30, 1903, over $38,000,000, which represented from 40 per cent. to 60 per cent. of their gross earnings; but this is the sum total of our information."

As to rates, a principle of grouping is known to prevail, based largely on the hundred-pound unit, with a higher charge for especially valuable traffic, arbitrary schedules in certain instances, and in some quarters, especially in the East, an adaptation to meet the competition of the post-office. "These few facts," it is summed up, "give us no basis for judging of the method of computation of rates or of the reasonableness of express charges, either in themselves or in comparison with other lines of service." The surprising fact has been brought out in Government hearings that the companies themselves, in most cases, keep no accurate statistics as to the nature of their traffic; the failure to tabulate such information being explained on the ground that most of the contracts with the railways are based on the gross earnings or space occupied, instead of traffic handled.

It is hardly necessary to point out the contrast between this state of affairs and that which prevails regarding freight rates. The shipper pays about four times as much for the package delivered at the door in a neatly painted wagon by a man in uniform as for that dumped in the freight house by a man in shirt-sleeves. Yet the two have been carried over the same tracks, in cars owned by the same company. In the one case the carrier is compelled to publish the essential facts about its traffic and earnings; in the other, it makes no report to any authority whatever. The express company, in a word, "is being permitted to derive all the advantages of a common carrier, and to assume none of its obligations."

The Interstate Commerce Commission, at its organization, included the express companies among the common carriers required to file their tariffs, but, after strenuous objection from the companies, waived this point, largely on the ground that the intent of the law was not to embrace independent companies having only a contractual relation to the railroads. Since then the Commission has repeatedly asked definite authority to obtain such reports, but Congress has never granted it.

This matter is given increasing importance by the fact that the alliance between the railroads and the express companies is becoming closer. The railroads, whose traffic and rates are under supervision by public authorities, seem to be turning over certain lines of traffic to the express companies, whose charges are unrestricted. This is especially true of perishable commodities which demand speedy delivery. "There is no indication," says Mr. Dixon, "that the railways, except in the products of the packing and fruit industries, in which they have been prodded by the private-car owners, have any intention of developing this traffic and displacing the express service. Yet it is difficult to determine whether the railways are doing their full duty, without having some definite information regarding express traffic."

The community of interest between railroad and express company is shown by the impressive list of railway representatives on express-company directorates, and the corresponding array of express officials on the railway boards. Evidence of reciprocal ownership of stocks is also available, as well as proof that the companies hold one another's stock in considerable quantities. As to the purely nominal character of their competition, President Ingalls of the Big Four testified before the Industrial Commission that the express companies "manage their own business by making agreements. I should be sorry to have them put on the same basis as railroads, so they could not agree."

Certainly, the various reasons put forward for exempting the express business from Government supervision or compulsory publicity cease to have any force if the express company is to be merely the railroad itself under another guise. The reviewing of railroad rates—whether power of arbitrary charge goes with it or not—becomes a travesty if the railroad can deliberately turn over any portion of its traffic to the express company, which can charge whatever it pleases. And, similarly, the prohibition of direct combination between railroads can hardly be enforced if through these same express companies they can pool certain classes of traffic as they please.

GERMAN PHILOSOPHY IN RUSSIA.

To a critic who once complained that he found traces of Feuerbach's philosophy in the writings of William Black, the novelist replied that he had never heard of Feuerbach. However extravagant in this case the critic's supposition may have been, it is doubtless true that most writers unconsciously reflect in their work the prevailing philosophy. Philosophical ideas are like fashions which originate in the great world, and are afterwards imitated in little by all classes and conditions. They are like water poured upon the ground which finds lodgment in obscure places and at unexpected levels.

During the last one hundred years some such process of infiltration has been going on in Russia. When the history of the period from the reign of Nicholas I. to the present time is written, something will have to be said of a group of enthusiasts who were among the first to inject into the Russian mind the principles of Western philosophy. About the year 1835 the philosophy of Hegel was imported from Germany by the Muscovite Stankevitch. Previous to

that time the old Byzantine ideas had been dominant. It is true that a small minority had read with curiosity, but without fervor, the French philosophers of the eighteenth century; but the correspondence between Voltaire and Catharine II. shows how little impression had been made. The only radical opinions noticed in these letters had reference to the subject of religious tolerance; political abuses and agitation are almost unnoticed.

During the reactionary reign of Nicholas I. a few minds were attracted by the abstract and mystical philosophy of Schelling, which, however, had no political implications. It was only after the death of Hegel that germs of Occidental thought were planted in Russian soil, that were gradually to have important political results. At that time there were in Russia two opposing schools or parties. According to one, progress and higher civilization were indigenous, and the nation had to work out its own salvation. The other held that the ideal for Russia could be realized only by grafting upon the parent growth something foreign. The Hegelian propaganda found a chosen few hospitably inclined to the principles of German philosophy. From them proceeded, however, that tendency towards anarchy and nihilism which has had such profound and sometimes tragic results. At first sight, it seems strange that radical political consequences should have been deduced from such a system of thought; for the Hegelian philosophy, by its theological conservatism and its defence of monarchical institutions, has been regarded as a bulwark of the Prussian state. Yet its dialectical method of reconciling contradictions, through a higher unity, made three interpretations possible, represented by a Right, Centre, and Left. The last of these found advocates in Russia as well as in Germany.

The philosophical clubs of Moscow, in the period referred to, were one of the manifestations of a restless and often vicious society; but it soon became the fashion to discuss in all places and at all times the most obscure questions of the Absolute philosophy. This tendency found but little encouragement at the universities, where, during the reign of Nicholas I., students were admitted only by special favor of the Government. Yet German professors were beginning to be called to Moscow, and formed a nucleus for this life of discussion and fermentation. In the beginning the clubs were not seditious, but were instrumental in laying down the principles which have ever since guided the propaganda of anarchy. The interest of Stankevitch in German thought was chiefly abstract and metaphysical, but among his followers in the "Occidental" society it was far otherwise. The conservative Hegelianism which they received from the West, they soon exchanged for the ideas of the Hegelian Left, and passed from the vague idealism of the 'Encyclopædia' to atheism, materialism, and revolution.

It was not by Stankevitch nor even by his accomplished disciple Belinski, who was a critic rather than a philosopher, that Hegelianism was interpreted as a revolutionary doctrine. The most famous name in this circle is that of Bakunin. One thinks of him as a mad political fanatic rather than as a propagator of German doctrines; yet it was in the latter capacity that he first made his impression upon Russian society. Even where the members of the revolutionary clubs departed from the letter of Hegel's philosophy, they adhered to its spirit. If, on the one hand, they preached an extreme individualism—a counterpart of the Hegelian idea of self-realization—on the other, they had that broad view of nature and history which takes no account of the accidents of nationality and government. The inconsistencies, the hardships, and misfortunes of the world were neglected, because they had before them a political ideal which at any risk they sought to realize. Their radical conceptions may be said to have created anarchism as an anti-political theory, and as a system of practical ethics. For since the time when Bakunin left the army to expound Hegel to the young men of his group, his personality and teaching have been the inspiration of all anarchistic plots and nihilistic adventures. To him, more than to any other, the anarchists owe especially that atmosphere of romantic mysticism which has given them the character of a religious sect as well as of a political party. From this same coterie came also Ogareff and Herzen, brothers in misfortune, both originally idealists and mystics, steeped in the sentiments and theories of Schelling and of Hegel. They passed inevitably to the Hegelian Left—to its atheism and materialism.

It need not be added that this striking group of men were not suffered to carry on their propaganda without police interference. Some found a refuge in France and met congenial spirits among the followers of St. Simon and Proudhon; some were forced to give up their life at Moscow and retire to the southeastern provinces; some were sent to Siberia. It is interesting to notice that in so far as they were practical in envisaging politics, they fixed their hopes upon the communal organization of Russia. They rejoiced to see the day of the Zemstvo agitation; they saw it and were glad.

THE POPE TO THE ITALIAN BISHOPS.

Pius X.'s Pentecostal address to the bishops of Italy has been variously interpreted. Perhaps it may best be read in the light of the recent municipal elections at Rome, in which the Clericals united with Monarchists and Conservatives of all complexions and gave the Socialists a crushing defeat. Evidently, the pastoral letter of the Liberal Bishop of Cremona, urging the faithful to take part in local elections, must also be regarded as a practical application of the principles of the Holy See to the affairs of a single diocese. To be sure, it is no new thing for Italian Catholics to vote in municipal and provincial elections. The ban pronounced against the Kingdom of Italy by Pius IX. in the bull *Non expedit* simply forbade the sons of the Church to participate in Parliamentary elections. Local and municipal institutions preceded the siege of Rome, and have never been specifically under Papal reprehension. Practically, however, the devout have quite held aloof from the present régime, voting only when some matter of imperative interest was at issue. Particularly has this been the case at Rome, where the form of the imprisonment of the Pope and of the irreconcilable feud with the usurping house of Savoy has been rigidly maintained. Accordingly, it is a significant innovation when, at Rome, the partisans of the Pope-King vote side by side with those of Victor Emmanuel III.

Not unnaturally, the Italian newspapers have leaped to the conclusion that the *Non expedit* is a dead letter, and that the contention between the Vatican and Quirinal is in a way of solution. An examination of what the Pope actually said hardly warrants so optimistic a reading. His Holiness, speaking of the ban upon political activity by Catholics, observed: "Nevertheless, other reasons equally grave, founded on the highest good of society, which it is our duty to preserve at all costs, may require that, in particular cases, this law should be overlooked, especially when your venerable brothers [the bishops of Italy] recognize the strict necessity of the case for the good of the souls in your charge and the highest interests of your churches, *and when you ask for it*." Interpreted literally, this is not a peace measure. It merely admits exceptional cases in which believers may vote, and makes—and the point is important—not the individual Catholic, but his bishop, the judge of such necessity. Like many other Papal inventions, it is retroactive; in a sense it merely regularizes the pact, frequent in the last general elections, between Catholics and other conservative voters against the Socialists. The Pope simply admits in principle what has already been done in practice. On the other hand, one can readily conceive a process by which exceptional toleration of the monarchy may gradually become the rule, and some form of public reconciliation between the Papacy and the kingdom may be effected, on the basis, perhaps, of the Guarantees, and the annual subvention, which up to this time the Vatican has

steadily refused. In any case, the lifting by ever so little of the ecclesiastical blockade that has stood for a generation is by so much a stage towards reconciliation.

If this meant that individual Catholics were now to be free to do their duty as Italian citizens independently and loyally, it would be a most welcome consummation. Unhappily, this programme, which is that of the Christian Democrats, is explicitly denounced by the Vatican, and provision is made for a compact Clerical party captained by the bishops. No other construction can be put upon the words: "It is of some importance that the same activity, already laudably displayed by Catholics *in preparing with a good electoral organization* for the administrative life of the communes and provincial councils, should be extended to *similar preparation and organization for political* [*i. e.*, national] *life*." This means, if words mean anything, that the Pope recommends the preliminary organization of a national Clerical party.

Upon the dislocation that must result in Italian political life if a compact Clerical Centre sat at Montecitorio we have frequently remarked. Evidently such a disciplined force might readily hold a Parliamentary balance of power and make its bargains upon advantageous terms. It could immediately project into the Chamber of Deputies a large number of leaders of extraordinary political capacity and experience. We have held that such a body bound to a particular interest would have a most unfortunate effect upon the public life of Italy, and we still believe that if the *Non expedit* stands between Italy and militant Clericalism in Parliament, its relaxation will be chiefly deplored by that reigning house against which it was originally directed.

But of course it is a far cry from the recommendation of political organization, by the most unworldly of Popes, to the upbuilding of a political party like the German *Centrum*. The Pope and his bishops may well find it difficult to hold the Catholic voters to a Clerical programme. There is considerable independence of opinion between the Alps and the Tiber, and even in southern Italy distrust of the priest is a pretty general feeling, and one that would stand in the way of a Clerical propaganda. There is, then, a reasonable hope that the practical effect of Pius X.'s initiative may be the gradual distribution of the Catholics who so far have abstained from voting, among the various political parties of Italy. In a country essentially Roman Catholic, there will inevitably be a certain amount of political activity by the Church; it is desirable for the sake of the Church and State alike that such activity should be as limited as possible. The possibility of a party actively directed from the Vatican is a strong reminder that the present constructive enmity between the Vatican and Quirinal has its distinct advantages, and that it may be unwise to disturb too abruptly a highly illogical or even deplorable condition.

FORTY YEARS OF "THE NATION."

The Editor of the *Nation* had not intended to plant a stake on the completion of the fortieth year of this journal with its last issue in June. Least of all a personal stake. The temporal division of the day's work is what chiefly interests him, and always what is before rather than what is behind. Persistency, with him, is in the bone, and on this inheritance of nature he never thought to plume himself. His colaborers, however, would have it otherwise, and conspired to mark the term by a testimonial which they presented on July 6, the date of the very first issue of the *Nation* in 1865. An inscribed vase of great beauty was the visible token, and it was accompanied by a congratulatory note signed by more than two hundred of the *Nation's* staff, some equal veterans with the Editor. Had all this been done in a corner, it should so have remained—a matter among friends. But the utter secrecy observed in carrying out the enterprise having been followed by advertisement in the daily press, the Editor is reluctantly compelled to share the news with his own readers.

"You have made the *Nation*," runs the note, "for more than a generation the chief literary journal in America—the medium of the best criticism, and the mouthpiece of high intellectual ideals." Such has, in fact, been my aim, attended let others judge with what success. My disclaimer relates to the degree of individual merit implied. It is true that I put my hand to the plough with the initial number of the *Nation* and have never let go the ploughtail. It is true, also, that while the literary department was my especial charge, I participated from the beginning as a writer in the political conduct of the paper. What is needful to be pointed out is, that I came to the task an inexperienced youth, and at once entered into pupillage to a great writer and master political moralist, the late Edwin Lawrence Godkin, whom with admiring eyes I saw

"Mount in his glorious course on competent wing."

He it was that shaped the framework of the *Nation* and gave the informing spirit, and drew around him those liberal natures on both sides of the Atlantic who impressed a permanent stamp of authority, ideality, and scholarship on the paper. In the tentative days, Mr. Godkin was intimately counselled by Charles Eliot Norton, one of the indispensable founders of the *Nation*, and still one of its oldest as well as most valued contributors. It was Mr. Norton who penned the note of congratulation which I feel constrained to gloss with due remembrance of the makers of the tradition which it has been my privilege more or less independently for the past twenty-four years to uphold.

Long before the *Nation* had attained its majority, it had an entity identifiable with no one man. It drew its intellectual and moral support from a great body of enlightened and humane men and women, who became the *Nation* incarnate. I believe I can confidently appeal to the experience of subscribers and readers—readers always largely in excess of subscribers—in affirming that "a *Nation* man" stands for something definite in the social order, and that the paper furnishes a trusty bond of congeniality wherever strangers come together with no other introduction. This is a cheering thought for the Editor, but it should not lead him to confound his office of intermediary with the constitution of the real *Nation*.

The dedicatory inscription on the vase presented to me was written by Goldwin Smith, and speaks of the service rendered to my country by "forty years of able, upright, and truly patriotic work in the editorship of the *Nation*." Such a certificate from such a source is honorable indeed, and I can candidly profess to have been animated by patriotic motives in every line I have ever written for this journal. These motives I was born to, and they proceed from that larger outlook which my father (whose term of editorial labor I have now just equalled) expressed in his *Liberator* motto, "My Country is the World, My Countrymen are all Mankind." They imply not only freedom from provincial narrowness in human sympathy, but a right of clear vision and independent criticism of one's own people, one's own Government. I could ask nothing more than to be found to have derived also from my father the concomitants of his patriotism, "the modest spirit, the forthright and indomitable temper, heat," and the strong spurning of the vile, and the untrammelled word."

It does not enter into my purpose to review the fortunes of the *Nation* in its four decades, nor to discuss its still relative isolation among independent presses. It would but mar a festive occasion to contrast the high, all-embracing philanthropy to which the country seemed dedicated on coming out of the civil war—Lincoln's Gettysburg speech still ringing in our ears—with our present state of shattered republican ideals, our tyrannous subjection of "inferior" peoples, our all-prevalent militarism. Then, our American reliance was on the force of example, such as Coleridge, not yet disillusioned, anticipated from the French Revolution—

"And, conquering by her happiness alone,
Shall France compel the nations to be free."

Now, we have come down to compelling them to pay their debts and the usurious interest of revolutionary speculators, to govern themselves in accordance with our notions, and to yield the vineyard which we covet.

It remains to thank those who have united in a little-called-for, wholly unexpected tribute of personal esteem and affection, from the bottom of my heart. So long as strength endures, I shall endeavor with their aid to perpetuate a journal which has, I believe, no exact parallel in any other country, and whose service has ever been a service of love. It is mine, I repeat, only in name.

For the sake of the record, I will add that with Mr. Norton and with Mr. Goldwin Smith were associated Messrs. Charles Francis Adams, James Ford Rhodes, William Roscoe Thayer, Francis Philip Nash, Joseph Hetherington McDaniels, and Russell Sturgis; and, with a proper pride of fellowship, I append the distinguished list of those whose signatures were affixed to the congratulatory note—a bede-roll which the

stealth of preparation prevented from being as full as it might have been.

WENDELL PHILLIPS GARRISON.

TAINE'S CORRESPONDENCE, 1870-1871.—II.

PARIS, June 28, 1905.

Taine was still at Orsay in April, 1871, writing almost every day to his wife, giving her whatever news he could obtain of the interior of Paris, which had become a "pandemonium." He informed her also of the temper of the National Assembly at Versailles. The programme of M. Thiers was still in force: union in the Assembly, reorganization of the national forces and of the administration, payment of the war indemnity, no discussion of the form of the future government.

"The moderate republicans themselves admit this. Louis Blanc, having proposed to the Left to ask for the definitive proclamation of the Republic, met with a decided refusal. The impression is that the Chamber is more united than it was at Bordeaux, the Deputies having made mutual acquaintance and being rid of the violent Reds. The impression is also that the present Chamber is less reactionary than the previous. . . . The Legitimists at Versailles, talking, reading, feeling the neighborhood of Paris, are more moderate, see better the necessities, are more politic. Almost all of them ask for the most extended liberties. The fusionists try to make the following compromise prevail: to frame the most essential fundamental legislation, the electoral, municipal laws, etc.; then, the edifice once constructed, to place at the head of the vault Henri V., supported by the Orléans, his heirs, ministers, and principal officers."

Such was undoubtedly the wish of the Legitimist party, which was in great force in the Chamber. The Orléans princes accepted the principle of fusion, and all the moderate Republicans were willing to accept it if they could be guaranteed a liberal constitution. Taine saw at once the difficulties of fusion. "My objection," he wrote, "is always the Clerical, Absolutist, Austrian education of the Duke of Bordeaux. They answer me that he would be kept in bounds by the fundamental laws and by the collaboration of the Orléans." He felt, however, that something had to be decided. "There are four parties in France; two at least must unite in order to offer resistance to demagogy and the Bonapartes, the dictatorship from below or from above."

It soon became evident that the insurrection of the Commune could not be vanquished in a week, so Taine went again to Tours; bombs were falling in Sceaux and Fontenay, and he was preparing lectures which he had to deliver at Oxford. I have heard Taine's letters criticised on account of the perpetual mixture in them of purely personal and often trifling remarks with considerations possessing general interest; it is to me one of their merits. They are perfectly sincere, they were not written for the public in order to produce an effect or to preach a doctrine. We find in them the real man, horrified at what was going on, waking, as it were, out of a long dream; a man of the study, fundamentally pacific, a believer in ideas; one who had been brought up, as all thinkers were till 1870, in admiration, almost worship, of German culture and German ideas; a believer also in liberty, brought face to face with war, invasion, and with the Communistic fury. His mind suffered a sort of revulsion. His conscientious, observing intellect could hardly absorb all the sensations which were troubling his rest. The letters are a candid avowal of his disappointments, his fears, his indignation; and I don't find it unnatural that this should take the form of disconnected descriptions and remarks, nor that these remarks should be mingled with all sorts of small family and personal matters.

Taine thought of establishing himself in Switzerland, in order to live there quietly, and to make only an annual visit to Paris; perhaps he could give lectures in Geneva, as Sainte-Beuve had once done. His first letter from England was written on the 20th of May, from London, where he saw Dean Stanley, Lord Houghton, Grant-Duff, Arthur Russell, Henry Reeve, Van de Weyer: "You may think that in London I have the spleen—it is a part of the local color. . . . I have the same impressions as before—a colossal industry, enormous wealth, paupers in rags, ignoble lanes behind sumptuous streets. . . . I promise myself only a single pleasure, which will cost little and be very simple: it will consist in not seeing the Exhibition." He dined with Grote, the historian, and his wife. "She is sixty-five years old, an economist, an orator, 'a stout woman in the whole sense of the word' [this is in English in the letter]." The husband would make, he says, a fine portrait for Van Dyck—very tall, with very marked features, seventy-five years old, a true gentleman, but who understands history, "à l'anglaise," only on the political side. He has written the history of Greece, and has never been to Greece; he cares nothing for places, or for the climate.

Taine learned in Oxford of the horrors of Paris, the burning of the Tuileries and the Hôtel de Ville; he was in the Library of the University when the librarian with a sort of compassion showed him the papers containing the dreadful news. "These men," he says, "are enraged wolves. And they used petroleum? What could have been saved from such flames? Never would the Russians have done as much. These brigands, who turn against monuments and masterpieces, place themselves out of hu-

manity's reach." There are notices in the letters of Pattison, the Dean of Lincoln, of Max-Müller, of Jowett, master of Balliol, "a Liberal who is near to Renan, who has written on Plato and Saint Paul," of Matthew Arnold, of Henry Smith. Taine notes all along what he called the "petits faits," his favorite method, which helped him to give a little life to what he wrote, but had the danger of inducing him often to generalize from isolated facts. At Jowett's house, he met Swinburne.

"His verses are in the manner of Baudelaire and Victor Hugo; a small, red-haired man in a frock-coat with a blue cravat, which contrasted with all the black coats and white cravats. He stiffens in talking, throws himself backward with a convulsive movement as if he had the delirium tremens. Passionately fond of modern French literature—Hugo, Stendhal—and painting. His style is that of a visionary in bad health, who systematically looks for excessive sensations."

Taine met also Miss Arnold, "a very clever girl," who became afterwards Mrs. Humphry Ward, and who has made a great and deserved reputation by her novels, 'Robert Elsmere,' 'Lady Rose's Daughter,' 'The Marriage of William Ashe.' Miss Arnold told Taine, who was wondering at the literary preoccupations of the ladies he met: "Everybody here reads, writes, or gives lectures; we must all follow the current. After all, it keeps us busy, and the library is so fine, so convenient." "She is not at all pedantic; it is the outflow of youth and of intellectual strength." But the critic does not forfeit his rights; he adds: "In all I read or hear, I see nowhere the fine literary sentiment, the gift or the art of understanding souls and extinct passions. They are chiefly learned or solid—for instance, Mr. Freeman, who recommences the Norman Conquest of Augustin Thierry."

On his return from Oxford, Taine recommenced his lectures at the École des Beaux-Arts, and began to collect in the National Library and in the National Archives the materials for the work which he published afterwards under the general title of 'The Origins of Contemporary France.' He abandoned his purely speculative and philosophical researches. As his editor says: "In presence of the ruin made by the war and the Commune, and of the perturbation of spirit amid the work of national reconstruction, it seemed to him that the hour of pure speculation had passed, and that the thinker, as well as the man of action, owed all his strength to his country." It seemed to Taine that the troubles of France during the whole of the nineteenth century arose from the too sudden rupture of French modern society with the traditions of the French race. The rupture was made at the end of the eighteenth century, by the Revolution; he undertook to describe in succession the Old Régime, the Revolution, the New Régime. It does not enter my plan to criticise here this great work. The method which Taine followed may be called the scientific method; the bare, minute, often fastidious study of facts. His facts are too often petty; but no fact seemed to him small if it threw a little light on the subject of his study. It must be confessed, however, that a certain want of discrimination, of proportion, is often felt, and that the reader's mind is often lost in the disorder of the data on which hasty conclusions are based.

During the summer of 1875, Taine remained on the shores of the Lake of Annecy. He established himself there again the next year, and bought of an uncle a house at Menthon-Saint-Bernard. Savoy became his favorite residence; he considered a great city like Paris or London not a permanent residence for a thinker; that he ought to go to the capital only in order to exchange and compare ideas with the intellectual élite, and to do his chief work in retirement. He spent nineteen years on his estate at the Lake of Annecy, working in his room most of his time, taking short walks in his garden and living in a sort of dream, surrounded by a very affectionate and intelligent family, as much devoted to his works as he could be himself.

He was induced to present himself to the Academy in 1875, but was defeated. The last letters of the volume of his correspondence just published allude to this academical campaign. The charm of correspondence is partly in its profuseness when the writer is a man of Taine's type. The editors were right in giving us the whole of this correspondence, and we can only hope that they will continue their work with the same care and conscientiousness.

Correspondence.

MR. ROOSEVELT'S VIEW OF THE VICE-PRESIDENCY.

To the Editor of The Nation:

Sir: In one of his cleverest short stories, Edgar Jepson represents the private secretary of an English premier going through all the earlier speeches of that high dignitary in order that something he is about to say may not conflict too glaringly with anything he has previously said. "Flappers" of this painstaking character should be included in the retinue of all our public men, particularly when they are given not only to oratory, but to large-scale literary production as well. Thus, one of Mr. Roosevelt's assistants might find the present moment opportune to remind him of certain comments on the office of Vice-President made in his 'American Ideals' no further back than 1897. At that time, when the buzzing of the Presidential bee must have seemed leagues remote from the bonnet of New York's strenuous police commissioner, Mr. Roosevelt wrote:

"The Vice-President . . . should be a man standing well in the councils of the party, trusted by his fellow party leaders, and able in the event of an accident to his chief to take up the work of the latter just where it was left. . . . One sure way to secure this desired result would undoubtedly be to increase the power of the Vice-President. He should always be a man who would be consulted by the President on every great party question. It would be very well if he were given a seat in the Cabinet. It might be well if, in addition to his vote in the Senate in the event of a tie, he should be given a vote on ordinary occasions, and perchance on occasions a voice in the debates."

So long as Mr. Roosevelt served in succession to President McKinley, his Secretary of State (under the act of 1886) occupied the place of heir apparent in our political system. Since March 4, however, there has been nothing to prevent the realization in part, at least, of the foregoing "American Ideal." No constitutional reason exists for denying Mr. Roosevelt the right to consult with Mr. Fairbanks informally as much as he pleases, or even to call him into the sessions of the Cabinet if he so desires. Doubtless Mr. Beveridge would condemn such action most vociferously, and an echoing clamor might rise as by magic from the fat corn lands of Indiana; but such opposition could base itself only on grounds of party or personal policy. As to giving the Vice-President a vote in the Senate on ordinary occasions, or "perchance on occasions a voice in debate," the matters is hardly so simple. According to Article I., Section III., Clause 4 of a document sometimes referred to still, in spite of the fact that it is near six-score years old, "the Vice-President of the United States shall be President of the Senate, but shall have no vote, unless they be equally divided." An unconditional negative surmountable only by amendment stands, therefore, in the way of giving the Vice-President a vote in the Senate on ordinary occasions. Mr. Roosevelt did not stop to consider this difficulty in his 'American Ideals'; but, even assuming it disposed of, a still more troublesome question arises. Equal representation in the Senate, as one of the great compromises of the Constitution, is specifically exempted from amendment in the ordinary manner by Article V., which provides that "no State, without its consent, shall be deprived of its equal suffrage in the Senate." Doubtless quite a number of our States would be disinclined to allow Indiana at the present time, or any other State in the future, three votes and voices to their two in the upper house of Congress. But, after all, as the Honorable Tim inquired: "What's a little thing like the Constitoo-tion between frinds?" Perhaps when Mr. Roosevelt has acquired the treaty powers of the Senate and otherwise extended the scope of his office at the cost of the legislative and judicial branches, he will divide with Mr. Fairbanks. There will be more to divide then, anyway. B.

Ithaca, N. Y., July 7, 1905.

TURKISH TALES.

To the Editor of The Nation:

Sir: Your review of the book called 'Told in the Gardens of Araby' contains several statements which need to be rectified. Kúnos published ninety-eight Turkish folk-tales in the original in two volumes (Budapest, 1887-89), and a Hungarian translation of *a few of them* in a separate volume (Budapest, 1889). The latter has been translated into English by Nisbet Bain (London, 1896). The Hungarian savant published twenty-five additional Turkish folk-tales in the original in the volume entitled 'Mundarten der Osmanen' (St. Petersburg, 1899). The statement that Kúnos collected his tales in Anatolia was refuted long ago, and is contradicted by the title of his recent volume, 'Türkische Volksmärchen aus Stambul' (Leyden, 1905). It contains a German translation of fifty-one tales. A collection of fifteen fairy tales has been published in Stambul, under the title of 'Crystal Palace.' The original of the tales published by Kúnos has such a Stambul flavor about it that I do not see how your reviewer could have mistaken it for Anatolian Turkish. A specimen of

the latter has been given by Kúnos in his 'Mundarten der Osmanen,' p. 408. O. T.

June 16, 1905.

[Our critic's only point of correction—apart from bibliographical expansion, which seemed unnecessary in our Note—appears to be that those tales are not from Anatolia, but Stambul. In this he may quite possibly be correct; Kúnos's last volume (Leyden, 1905), to which he refers, has not yet reached us.—Ed. Nation.]

SHAKSPERE, BEN JONSON, AND PLINY.

To the Editor of The Nation:

Sir: Your excerpts from Professor Sonnenschein's article, in your issue of June 29, with accompanying comment, will have added interest if you permit me to direct attention to a brief anonymous contribution in *Baconiana* for January, 1904, which until now has been quite ignored. Therein it is shown that the brief Epistle Dedicatory of the First Folio, signed by Heminge and Condell, is a close paraphrase of the preface to Pliny's Natural History! Of the nine parallel passages there adduced, the eighth is as characteristic as any:

From the First Folio.	*From Bohn's Translation* (1855).
Country hands reach foorth milke, creame, fruites, or what they have: and many Nations (we have heard) that had not gummes & incense, obtained their requests with a leavened cake. It was no fault to approch their Gods by what meanes they could.	But the country people, and, indeed, some whole nations, offer milk to the Gods, and those who cannot procure frankincense substitute in its place salted cakes, for the Gods are not dissatisfied when they are worshipped by every one to the best of his ability.

It is important to add that while there was an English translation of Pliny extant as early as 1601, absolutely no resemblance can be detected between this and the Heminge and Condell Dedication. It remained for the translation in Bohn's Library edition (1855) to disclose the remarkable resemblance. Malone long ago suspected that this dedication was really the work of Ben Jonson, and some few critics have agreed with him.

Baconiana not being easily accessible to American readers, it may be stated that there is a bound file at the Astor Library: shelfmark. 544 C. Chas. A. Herpich.

New York, July 7, 1905.

Notes.

Harper & Bros. will publish directly 'Love's Cross-Currents,' a novel by Algernon Charles Swinburne.

Thomas Whittaker has nearly ready 'Model of a Motor Car,' with an historical sketch and brief description of the working parts, by Hugo Güldner, with superimposed colored charts.

The first part of a work of great value and equal labor, viz., the 'Corps de Droit Ottoman: Recueil des Codes, Lois, Règlements, Ordonnances et Actes les plus importants du Droit intérieur, et d'Études sur le Droit Coutumier de l'Empire Ottoman,' by George Young, second secretary of the English Embassy, has appeared from the Clarendon Press (New York: H. Frowde) in three volumes; Part 2 will appear during the present year in four volumes.

We read in the ninth annual report of the Free Library of Philadelphia, that the late Secretary Hay permitted his eulogy of President McKinley "to be printed in Moon embossed type," in response to many requests from the blind for a Life of McKinley. Mr. Hay, of course, consented, and defrayed half the cost of printing. Some who recall that eulogy may think this a case of the blind leading the blind.

The Englishwoman who writes under the pseudonym "Vernon Lee" has always displayed a peculiar talent for topographical description, that most difficult art. In her latest volume, 'The Enchanted Woods' (John Lane), she has collected some thirty brief essays, or, rather, sketches from her notebook, all of them descriptive of the moods that are inspired by certain surroundings in the soul of the passing wayfarer. She is an insatiable traveller, but her impressions are not such as might occur to any tourist of imagination who should find himself, say, at Arles, "where the Rhone stagnates," or at the shrine of the Black Madonna on the top of Monte Mucrone, or motoring through the quiet villages of Surrey. Vernon Lee, when she sets out to record her encounters with the divinity of a place, the *genius loci*, puts in every descriptive touch with a light hand, and implies that all this sunshine and romance, or, if you turn the page, all that chill gray dreariness with which she can invest some out-of-the-way corner of Italy or France or Spain, is wholly subjective—a matter of a "dull, bad temper" one day, or on the next of a genial enthusiasm due to fine weather. But a gift of expression and an imagination easily kindled are less uncommon than that other fascination which Vernon Lee can secure for such essays as these. What gives the book a permanent value is her thorough knowledge of the literature, the art, and the architecture of these countries in whose remote corners she has from time to time made her home. The possession of so much solid knowledge would tempt most persons to a display of pedantry, but from this danger Vernon Lee is happily saved by a genuine sense of humor and a capricious turn of mind.

To the increasingly voluminous but not always reliable current literature dealing with immigration, Mr. J. D. Whelpley's 'Problem of the Immigrant' (Dutton) is a distinctly useful contribution. The problem has been studied too much as a national, not to say a "parochial," one. Hence there has been a tendency to forget that other countries besides our own are grappling with the question, and that the problem of immigration has its correlative problem of emigration for those countries which we glibly talk of as anxious to dump their citizens upon us. Mr. Whelpley presents the problem convincingly as essentially international. As he clearly puts it: "The emigration movement from one country is the immigration movement into another, or perhaps a dozen others. . . . Emigration has unquestionably become an international affair, and, until it is so treated, complications and evils resulting therefrom can be only partially and quite ineffectually controlled by each nation acting for itself, independently of all others." No better evidence could be produced of this fact than the legislative provisions and regulations governing the movement of population enacted by various governments in Europe and America. Mr. Whelpley has rendered a great and much-needed service in making accessible those of Continental countries. His summaries seem excellent and correct. The observations and brief discussion with which he accompanies them are illuminating and to the point. The book lacks all that sensational taint which mars much of the work of some of our more or less amateur sociologists. It proceeds from a scholar who has taken pains to collect trustworthy data before attempting to give even a conservative opinion on a difficult and complicated subject.

Miss Gertrude Bacon, herself well known as an aeronaut, has produced 'Balloons, Airships, and Flying Machines' (Dodd, Mead & Co.). The whole story having been already told a thousand times with every imaginable device of sensation, her problem was to make a brief thousand and first recital not wholly uninteresting, without resort to any other means than those that are strictly germane to the history of airfaring. The tiny volume that has resulted is a little triumph, due to a bright, fresh mind drawing from the headwaters of information ideas that sparkle with genuine interest in the subject, which is allowed to run on in its own natural babble. Just as an ordinary observer who stands up with some effort against the pressure of a high wind, and descries far up in the blue a balloon hurried along in a still more tremendous gale, is apt to forget that, to the balloonist himself, he seems to be in a dead calm—the spectator, indeed, finding it hard to think of such a thing—so the plainest narrative of a balloon trip told strictly from the able airman's point of view, in perfect equanimity, never mounting into any purple clouds, never soaring above any reader's head, but sticking to the *terra firma* of plain fact, makes a far stronger impression upon the imagination than in any other style it ever could. That was a discovery exhibited by Miss Bacon's father in his 'By Land and Sky'; and the daughter has caught a little of his charm. The illustrations are particularly well chosen, and several of the most vivid and telling are quite new. We do not know whether the "Crossing the Channel" (p. 46) is so or not; but the frontispiece certainly is.

Another little book of the same "Practical Science Series," entitled 'Radium Explained,' by Dr. W. Hampson, is not so fortunate an attempt. It is largely taken up with an attack upon the electronal theory of matter and with preparations for that attack. Now that theory, bright though its prospects certainly are, is very far from being proved, and it is quite a legitimate object of attack. But unless its opponent has a clear understanding of the theory of electricity, his argument will make wearisome wading; and this is the first fault of the present book. Its further fault is that it undertakes to solve this profound problem on a basis of common sense. Now common sense, rightly interpreted, has nothing at all to say about electricity, which ought to be left to specialists; and the attempt to drag common sense into the question can amount only to abandoning the study of experimental

phenomena and to engaging in cloudy talk about words and phrases. Dr. Hampson, however, is not alone in his ill-managed argument. Professor Dolbear, in the *Popular Science Monthly* for July, takes up a similar line of discourse, and so have others done. All these writers say that "electricity" consists in a particular variety of energy; but they do not tell us what they use the *word* electricity to denote. If it means, what physicists and others usually mean by electricity, a *charge* of electricity, then, as Sir Oliver Lodge well remarks, to say that electricity consists in energy is very much like saying that a glass of water is composed of energy. But the question of the truth of the electronal theory is not a question of words—it is a question of how a certain laboratory experiment will turn out whenever we may be able, literally or virtually, to perform it.

Perhaps the most interesting point developed in Dr. Burton-Fanning's 'Open-Air Treatment of Pulmonary Tuberculosis' (Chicago: W. P. Keener & Co.) is the superior curative power of outdoor over indoor air, even when the apartment appears to be thoroughly ventilated. That there is such a difference, experience demonstrates. A distinct superiority in intractable cases is gained by placing the febrile consumptive in the open air in lieu of close to an open window. Why that is so, is not yet determined. Dr. Haldane has shown that there is no difference between the percentage of carbon dioxide or of oxygen in the two situations. It is true that occupied rooms always contain bacteria, and, although these are probably non-pathogenic in the ordinary sense when the apartments are kept ventilated and dustless, it may be that they play some part in the tubercular process. The outer air alone is devoid of such organisms, and perhaps that barrenness is a determining condition. Another suggestion is that air in motion has a particular influence upon health, as is hinted in the exhilaration of rapid passage through the air, or in that of certain winds. On the contrary, there are times, notably within the tropics and in dense forests, when the unconfined aerial ocean is really stagnant, and even healthy animal life becomes depressed. For many years general sanitation has increased the expectation of life for the tuberculous, and now the appreciation of an absolute indulgence in open air (and, we may add, residence upon a dry soil) regardless of other climatic conditions, as always advantageous and frequently essential, is growing among physicians and laity alike. Paul's τὸ πνεῦμα ζωοποιεῖ has a double significance.

The third part of Dr. Pope's 'Handbook of the Ordinary Dialect of the Tamil Language' (H. Frowde) needs no special notice. It worthily complements the grammar and exercises already reviewed in these columns. The subtitle, "a compendious Tamil-English dictionary," might mislead one searching for something more complete than a vocabulary of ninety-eight 12mo pages.

'Le Grand-Duché de Berg,' by Charles Schmidt (Paris: Félix Alcan), is a minute documentary study of the German principality formed by Napoleon in 1806 for the benefit of his brother-in-law, Joachim Murat. The chapter on economic conditions is particularly good; and the book as a whole, though not likely to interest the general public, may be commended as one of the best studies of Napoleonic administration yet published.

There is a very pretty piece of antiquarianism in the current issue of the *New England Historical and Genealogical Register*. Miss Mary Farwell Ayer discourses on the South Meetinghouse, Boston, 1669-1729, with an illustration of it, long lost to sight, which she discovered on a map in the British Museum beneath a pasted-over engraving of the later edifice. The Rev. Hiram Francis Fairbanks reports progress in the endeavor to trace the English pedigree of our Presidential Adamses, and promises more detail hereafter.

Part I. of the fifth volume of Mr. Edward Wilson James's *Lower Norfolk County Antiquary* (Baltimore: The Friedenwald Co.) presents unusual variety, and shows the sources of social and political history to be far from exhausted. Numerous slave-holding censuses are given, and in that for Princess Anne Co., 1830, we read (among the whites), "Jesse Dawley, F. B. [free black], & Father & Brother Wm."—that is, as the editor explains, he probably owned these relatives as Fanny Fuller, F. B., listed among the blacks as following the condition of her husband, "probably owned her husband," but not her son Arthur, enumerated with her. Africa Griffin, F. B., owned his wife. There were 1,950 slaves to 581 owners. Further on is a list of "Lord Dunmore's *black* banditti," viz., the slaves run off aboard the *Dunluce* and *Dunmore* by Virginia's last Royal Governor in May, 1776. They at least bore the names of F. F. V.'s, and were thus distinguished by their owners on recovering them later.

In view of the many conflicting reports as to the fate of the great historical library of Theodor Mommsen, it is some satisfaction to learn that the entire collection has been presented to the University of Bonn by a lady who does not desire her name to be revealed.

After considerable agitation in official circles, the University authorities in Vienna have finally agreed to admit a woman to the teaching corps. Miss Dr. Elise Richter delivered a "Probevorlesung" in the philosophical faculty, and is now a privatdocent. She discussed the Spanish drama "Celestin," dating from the sixteenth century, which shows in its plot a remarkable resemblance to "Romeo and Juliet." Miss Richter did not venture to argue that Shakspere based his plot on the Spanish.

The Russo-Indian problem, in which Lord Kitchener's recent note of alarm has awakened a fresh interest, was discussed by Sir Thomas Holdich at a meeting of the Central Asian Society. His belief, based on personal observation, was that England's strength in Asia was greater than the majority of Englishmen were disposed to admit. In India the prestige of the British Government was supreme, resting on a conviction that the inevitable dispositions of Providence had arranged that England should rule India. This prestige was greatly strengthened by the sentiment for Queen Victoria. In the wilds of the Central India jungles, and in Tibet also, he found that she was regarded as still living—an incarnation exerting a beneficent influence. Referring to the alleged danger from a Russian invasion, he called attention to the fact that the natural fighting material in India was at least double that of Russia, and that a call to arms to meet a foreign invader would be responded to almost with enthusiasm. He concluded with a plea for a good understanding with Russia in Asia, and the linking up of railway systems which would promote international commerce and would at once outflank all the complications of Afghan and Persian policy.

The Asiatic Society of Japan continues its creditable record of publication by issuing the initial portion of volume xxxii., containing a sketch of the life of Kwazan, the penname of N. Watanabe. This man was one of the "morning stars" of the great Reformation of modern Japan, and one of those inquiring spirits whom the Yedo bureaucracy could not wholly suppress. In the days when the Japanese people were fenced in both as to their bodies and minds, and allowed neither departure from home nor access to foreign thought, Watanabe persevered through the Dutch and the native interpreters in knowing of the world at large. When over thirty, after first seeing a Mercator's projection of the globe, he joined that party of "Dutch scholars," or seekers after Western learning, who were continually under suspicion and often under persecution by the Shogun's Government, because they were in favor of opening the country to foreign intercourse. These Dutch scholars formed two parties, named after different districts of Yedo, one studying medicine only, and the other history, geography, and literature, with the desire also of having Japan fortified against Western, and especially Russian, aggression. Watanabe, born in 1794, was the traditional poor scholar. When, in 1837, the American ship *Morrison* appeared off the coast of Japan, he wrote the book 'Dream Story of Genji,' which had a profound influence on thinking men. The far-seeing daimio of Echizen, who was afterwards the first to engage foreign teachers, urged that the Japanese castaways brought by the American ship *Morrison* should be allowed to land and the captain receive audience, but the other daimios opposed the plan. The translator, Miss Ballard, relying on the Hakluyt's Society's publication, seems to be ignorant of the American literature on this subject, especially the writings of Dr. S. Wells Williams and the book, by Mr. C. W. King, owner of the ship, on the 'Voyage of the *Morrison* and *Himmaley*.' In the end, Watanabe, ever under suspicion of the Yedo bureaucrats, thinking that his mere existence was an obstacle to the advancement of his feudal lord, opened his bowels in true Japanese style. It was not until 1870 that his reputation was cleansed by official pardon and a gravestone set up. In 1891, when his admirers erected a memorial, the Mikado's Government sent its contribution of 100 yen. The Marquis Ito has repeatedly eulogized him as a shining patriot. An interesting translation of a Japanese treatise on the Art of Preparation for War, with the tactics modelled on goose lines, fish scales, and stork-wings, is also translated in this number by Mr. R. J. Kirby.

The reorganization of the Wistar Institute of Anatomy of Philadelphia, which is now going on, promises much for the interests of that science. Its new advisory board consists of some of the most distinguished anatomists of the country; their first work has been to appoint to the chair of neurology Professor H. H. Donaldson,

who now holds the corresponding position at the University of Chicago. For the coming two years, Professor Donaldson will continue to lecture at Chicago for part of the year.

Two travelling scholarships, of the value of $1,500 each, have been established at the University of Paris for women who intend to become teachers.

Mr. Jacques Reich meets the interest of the hour with one of his large-scale etchings, the portrait of John Paul Jones, after Charles W. Peale's painting in Independence Hall. We are unable to make an immediate comparison between the two works, but Mr. Reich's aptitude for seizing a likeness is well established, and we have no doubt that he has produced an effigy in which reliance may be placed. Alertness is the main characteristic of the hero's face as here shown; the mouth is more amiable than firm. Jones is in cocked hat and the full naval costume of his rank. Mr. Reich's address is No. 2 West Fourteenth Street, New York.

—The presence of the vacation season is reflected strongly in the contents of the July *Scribner's*. Ralph D. Paine, Katharine Holland Brown, James B. Connolly, Sophie Jewett, and Arthur Train are the story writers. Augustus C. Buell introduces an interesting historical document brought to light by the publication of his History of Paul Jones, a narrative by John Kilby, quarter-gunner of the *Bon Homme Richard*, written down from memory in the year 1810, and now in the possession of Judge Wilbur J. Kilby of Suffolk, Va. The events recorded extend from 1776 to 1780, and, in spite of the lapse of thirty years, Mr. Buell finds in the narrative not a single error in any vital matter which can be tested by other evidence. Beatrix Jones contributes an article on Le Nôtre and his Gardens, illustrated by E. C. Peixotto, while Benjamin Brooks describes the little-known Tamalpais hill region of California. In the "Field of Art," Frederic Crowninshield reviews favorably the work of the Fine Arts Federation of New York through the nine years of its existence.

—The fourth of Mr. Howells's London papers in *Harper's* deals with the spots of particular interest because of some special connection with American origins, such as the Church of All Hallows, Barking, in which William Penn was baptized, and to which the headless trunk of Laud, persecutor of the Puritans, was carried from Tower Hill; the Church of the Danish St. Olaus, from whose parish Priscilla Mullins came; and St. Saviour's, in whose parish John Harvard was born. In strong contrast with the wanderings of Mr. Howells in old London is a floating trip down New York harbor, with James B. Connolly as the pilot. Mr. Connolly has found the one phase of beauty in his subject the view of the harbor from below at close of day. With atmospheric conditions just right, however, we doubt whether the rapid flashing into view of electric lights, after the sun has gone, can equal in splendor the effects produced by the last half-hour of a winter's sun. Herbert Jackson Hapgood, writing of "The Search for Men," maintains that the rewards for exceptional skill and ability were never so rich and so numerous as at the present day. Incidentally, Mr. Hapgood accepts and passes on the ignorant misconception that "civil service" means a hard and fast method of regular promotion according to seniority, by which a competent and energetic man must necessarily be kept out of the place which needs him, merely because there happens to be a lazy and incompetent man ahead of him on the payroll. If Mr. Hapgood would take the trouble to learn the difference between the civil service and the merit system of appointment and promotion in that service, he might learn at the same time that the main object of that system is to make it possible to get the right man for the place and increase the chances that this possibility will be used.

—The anomaly of leaving the great express companies outside the scope of our interstate commerce legislation forms the subject of the opening paper in the *Atlantic*, as appears in our comment elsewhere. Chester Holcombe considers some of the results of the Eastern war, now that the outcome, in its main features, may be safely discounted. Primarily, the attitude of dictation heretofore dominant in all dealings of the great Powers with the Orient must be dropped once for all. The right of Japan to protect China in self-defence must be fully recognized, now that she has demonstrated the possession of the power as well as the right. Mr. Holcombe regards the reluctance of the Chinese to accept new ideas from the West as largely the result of the offensive, dictatorial attitude of those through whom these ideas came. As to the building of railways and telegraph lines, "superstitious objections, such as disturbance of the graves of ancestors, . . . were almost wholly fictional, empty substitutes for the real reason, which the high ideal of courtesy possessed by the Chinese would not permit them to state frankly." One turns with some interest to a discussion of large fortunes, by the head of the department of political economy in the University of Chicago, but nothing is found beyond the commonplaces that the builders of large fortunes frequently take but a small fraction of the wealth which their managerial ability creates, that some rich men are bad and others good, some large fortunes honorably acquired and some dishonorably, some wisely spent and some harmfully, etc., with no more positive suggestions for the removal of admitted evils than that we should "work all together for a higher standard of morals and character in the person who controls the power of wealth."

—The discussion of the new A. L. A. cataloguing rules is contained in the June *Library Journal* by Mr. Charles Martel of the Library of Congress, who writes about "Common Nouns in German: Why they need not be capitalized." There has been much opposition to the use of lower-case initials for German nouns in the printed cards of the Library of Congress, and Mr. Martel presents a short summary of the historical aspect of the question. The first orthographist who discussed the use of capital initials was Johann Kolross, in his 'Enchiridion,' printed in 1530, but he confined their use to the first word of a sentence, proper names and the name of God. The use of capitals for all common nouns became more and more common, however, and it is now incorporated in the Prussian school law; protests have been raised from time to time, and the consensus of opinion among German linguists is opposed to initial capitals. Mr. Martel gives a list of some fifty works, selected at random from books in the Library of Congress, in which lower-case initials are used for common nouns. They are all linguistic works, however. The Library of Congress has repeatedly asked the opinion of competent authorities on the subject, and has received "many and emphatic" endorsements of its present practice. Mr. Martel quotes one, by Prof. Kuno Francke of Harvard: "I should consider it decidedly a retrograde step if the Library of Congress were to abandon its excellent practice of printing common nouns in German titles with a small initial letter." The historical and theoretical reasons against capitals may be very strong; the practical reason for their use is none the less very strong, to wit, that, in the vast majority of books printed in German, capitals are used, that the official code of orthography calls for them, and that cataloguing is hardly the proper medium for orthographic innovations, especially in the case of foreign languages. It would seem that the cataloguer might follow the usage of the books catalogued.

—An exhibit of women's work such as has confronted one from time to time in the great expositions, has usually been in the nature of a demonstration, and conveyed a tacit challenge. It is as though the organizers of the exhibit had said, in so many words, "Here are the pictures that we have painted, the statues that we have chiselled, the buildings of which we are the architects, the colleges at which we receive the most advanced education of the day. Who shall look on all this and still deny that we are the equals of men in the affairs of art and the intellect?" Few intelligent women can have left a "Woman's Building" without a sigh for the present, however it may have inspired her with hope for the future. The very existence of such a building must seem to her an admission of a truth that is ignored in feminine oratory. But there has been held recently in Paris, under the auspices of a daily paper, an exhibition of women's work which every woman could inspect with pride and without a qualm. It was held in a "Palais de la Femme," a "Woman's Building," but there was no implication of rivalry with men. It was a demonstration of woman's achievements as ministering angel, and there at any rate she has always been on firm ground. A recent number of the *Réforme Sociale* contains only a partial account of the four hundred "œuvres sociales" that were represented at the "Palais de la Femme." Charitable Paris is, it seems, feminine Paris. Cities, and the degradation and sordid life of cities, are the work of men; women, like the Prayers in the Iliad, follow behind to heal.

—What impresses the reader of the long list of good works and the exhibition of their machinery in Paris is, that the aim, probably unconscious, of all this effort and initiative of the Frenchwoman as a ministering angel has been the preservation of the home, the safeguarding of the family. The central exhibit, and the centre of interest for the crowds that thronged the building, was a model dwelling for the

artisan. That was a sort of altar round which were grouped all the other "œuvres" or good works. But it is not the comfort of the workman himself that is the aim of all this social service. He must be attracted to home life, diverted from drink, persuaded to thrift, because it is his child on whose health and morals the future of France depends. There are in Paris alone sixty-six independent societies managing day-nurseries for the children of the poor, the *crèche* where the child is fed and tended while its mother is at work. From the moment of his birth when the society whose function it is provides the mother with the necessary garments, the *layette*, every need of the early years of the child of the poor in Paris is met by the helping hand of some organization of women bent on seeing it safely through that difficult period. For the child's sake the mother must be kept free from tuberculosis as the father must be dissuaded from drink. The women of France exhibited the records of twenty charitable institutions for the prevention and cure of tuberculosis. Prevention rather than cure seemed to be the watchword of the exhibition, and the "works" of actual relief were in the minority compared with those of nourishment and preservation. But the cycle of feminine charity closed at last with the exhibits of ambulance work, and foremost among these the work of the Red Cross; woman coming behind to heal more obviously here, though not more literally, than in her mission to the slums.

—Dr. William Barry's 'Ernest Renan' (Charles Scribner's Sons), a very attractive little volume, forms one of a series of "Literary Lives," edited by W. Robertson Nicoll, LL.D. A life of Renan, the arch-heretic and apostate of his day, sympathetically written by a Roman Catholic theologian and professor, is a literary curiosity. By "sympathy" we mean here an apparently honest attempt on the part of the biographer to grasp the personality of his subject, and to describe his work as its natural outcome. The biographer of Cardinal Newman could hardly fail to bring these two diametrically opposed characters into comparison, and in fact Dr. Barry loses no opportunity to show the error of Renan's method by contrasting it with what Newman did under circumstances alleged to be similar. The fault in this rather taking comparison lies in the assumption that the minds of the two men could ever really have worked in the same way. If we could trust Dr. Barry, both were driven into the maze of rationalism, from which Newman freed himself through the essential greatness of his truly Christian intellect, while Renan, for lack of this same saving intellectual quality, sank ever deeper into the slough of infidelity and finally of moral indifferentism. The thesis is cleverly maintained, and the book, in spite of its obvious dogmatic purpose, is interesting throughout. Like a clever controversialist, Dr. Barry gains the sympathy of the reader by bringing out all the winning side of the great literary artist before he turns the corner and reveals him as the victim of his own brilliancy, stranded on the barren shore of an empty rationalism.

POLLARD'S CRANMER.

Thomas Cranmer and the English Reformation (1489-1556). By Albert Frederick Pollard, M.A. G. P. Putnam's Sons. 1904.

It was fortunate that the volume of the "Heroes of the Reformation" series devoted to Cranmer could be intrusted to such competent hands as those of Professor Pollard of University College, London. Already, by his studies of Henry VIII. and England under Protector Somerset, and by his articles in the Cambridge Modern History and in the Dictionary of National Biography, Mr. Pollard has shown himself a careful student of the English Reformation. He has to bear with the other authors of the present series the burden of its somewhat oppressive title. It is bad enough to have to suit one's self to the requirements of any serial publication; but to supply "heroes" in just sufficient quantity to fit into the publisher's scheme is more than could be expected of editor or writers. This demand, to make a hero of Thomas Cranmer, has evidently weighed upon Mr. Pollard's scholarly conscience. He indicates his responsibility in the preface; he returns to it in the closing chapter, and all through he allows it to appear at frequent and suitable intervals.

The book is an apology, but it must be confessed that, in view of the conditions of the literature of the English Reformation, hardly any other attitude is possible except that of denunciation. It is safe to say that there is no point in the whole movement, from the early years of Henry VIII. to the last years of Elizabeth, which is not a matter of bitter controversy. The very essence of the Reformation itself is the subject most violently discussed. Anglicans and Roman Catholics are united only in their determination to see no connection between earlier religious opposition in England and the separation from Rome. The Anglican is fiercely determined to magnify all the elements of ecclesiastical continuity, and to minimize all doctrinal divergences. The Catholic is bent upon bringing out every personal incident, such as the characters of Henry and Queen Mary, the greed of a hungry nobility, the corrupting influence of Lutheran preaching, and the beneficent administration of the pre-Reformation Church. The historian who is clear as to the demands of his science has to steer his way between these hopeless conflicts. If he is bound to have no thesis to prove, he is none the less compelled to think and to act under the rule of certain principles, and to give account of these frequently to himself and to his readers. Such principles Mr. Pollard has, and he lets us know from time to time what they are.

For example, he believes in a law of continuity more profound and more effective than the mere persistence of institutional forms, and he is persuaded that the Reformation in England rested upon a demand of the English people, going back to John Wicliffe. "It must not be forgotten," he says, "that the English Church in the sixteenth century assimilated little that had not been taught by the English Wicliffe." He quotes from Dr. Rashdall's sketch of Wicliffe to show that this is true, not merely in general, but in the essential details of both doctrinal and institutional change. That Government took the lead in these changes does not alter the fact that they represented on the whole the sentiment of enlightened Englishmen, and that this sentiment was a growth, rooted in a persistent though latent Lollardism

Another principle which Mr. Pollard lays down is the often-neglected rule that an historical event or an historical character is not to be judged in the light of subsequent events. It sounds a truism to say that no one can see into the future; and yet no canon of historical judgment is more often violated than this. We are, therefore, bound to remind ourselves again and again that those who guided the exceedingly complicated movement of the English Reform were always feeling their way in the dark from one step to the next, without a clearly defined policy, and without any assurance as to the kind or amount of support they were likely to receive. That, if any, is Mr. Pollard's leading idea. By it he explains the many contradictions in the action of the Government, not only of Henry, but of Edward and Mary as well. Here is found the key to his admiration for Henry the king in spite of his clear vision as to the—shall we say limitations?—of Henry the man. The man's lustful desire takes its place with the King's assertion of power, to make up his case as the defender of English right and English rule as against all comers.

Here is, of course, an echo of Mr. Froude, and it is refreshing in these days to hear a careful scholar venturing openly to praise that much berated champion of an unpopular figure. Mr. Pollard is not blind to the extraordinary freaks of "froudisme," but he frankly admires the equally remarkable grasp of an historical situation which of itself caused a sort of blindness as to details. His presentation is the more effective because it is so free from mere partisan passion. His chief interest is in the English Constitution, its definition, its continuity, and its defence. He cannot remind us too often that this is not even primarily a religious matter. Religion and politics could not in the sixteenth century be even thought of as divorced. The only question was as to their mutual relation. The Roman system had insisted on making the State subordinate to religion; now men were determined that, so far as England was concerned, the position should be reversed. Henceforth the State was to fix the character and the limits of religious practice. It was not a question in any one's mind of independence, but only of a change of masters, with such gains as that change might bring. That the King's lust for pleasure and for power gave the occasion for asserting the royal right with unprecedented energy is not denied; but, and here comes in another of Mr. Pollard's historical principles, the test of soundness in any great historical movement is to be found in its permanence. If the English Reformation had gone no deeper than Tudor lust and Tudor obstinacy, we may be quite sure that it could never have stood the test of Marian savagery and Stuart frivolity.

We have taken this line of comment because it is the line followed by Mr. Pollard in his treatment of Cranmer. His apparent dread of writing a hero-book has led him at times to somewhat obscure his central figure. At every stage he lays down for us the conditions of action and the canons of judgment, and then shows us how Cranmer fits into the situation. Like his royal mas-

ter, Cranmer is shown to us as a consistent opportunist: consistent, in that he had a clear view of evils ecclesiastical and an unwavering desire to amend them; opportunist, in that he was ready to utilize every turn of the political game for his great end, even though it cost him the appearance of consistency. He lent himself to Henry's schemes, especially to the Divorce—which Mr. Pollard carefully explains was not strictly a divorce—because he saw in this way the best promise of doing the things he thought best worth doing. He accepted the Royal Supremacy as likely to open the way to changes in practice that seemed to him desirable, and he went with the King in his prosecution of religious innovators in order that he might make it as little of a persecution as possible. All this sounds, of course, quite different from being the pliant tool of a half-mad despot; and yet the fact remains that he did the King's will, and had to bend himself almost double in the doing of it.

To make Cranmer's case better, Mr. Pollard goes as far as he can in justifying Henry's actions; but it is a pretty hard strain on our credulity if we must believe, even on Mr. Pollard's showing, in the belated scruples of the King's conscience as to his marriage with Catherine of Aragon, or in the wonderfully prompt twinges that beset him as to his marriage with Anne Boleyn because her sister had been his mistress. It is going pretty far into the realm of prophecy to say: "Had she [Jane Seymour] lived, she would have saved Henry and the English Church from the serio-comic episode of Anne of Cleves, and from the tragedy of Catherine Howard." So long as Cranmer was on hand, there could not have been any difficulty in finding ways to dispose of Jane Seymour, if the royal fancy had flitted in any other directions, or if religious politics had seemed to make this desirable. So easily workable a conscience as this of Henry might well serve Cranmer's turn, but it can hardly command the sympathy of Mr. Pollard's twentieth-century readers.

The most convincing portions of the book are those which treat of Cranmer's positive contributions to the Reformation, especially his work on the two editions of the Book of Common Prayer and the English Bible. In both these permanent achievements Cranmer's qualities of adjustability and compromise came into play. They were tasks requiring great nicety of verbal selection, and the widest learning, so that the choice might offend as few partisans on either side as possible. In the case of the Prayer-Book, the problem was to supply a ritual in the vernacular for all the people of England; for we have to remember that no party was as yet ready to face the alternative of a divided or an independent Church. The ritual must avoid the extremes of Catholic doctrine, such, for example, as transsubstantiation, but it must equally avoid all question as to the "really" supernatural method and effect of such sacraments as it chose to recognize. That Cranmer succeeded in this attempt is proved by the persistence of his ritual practically unchanged until now. So with the English Bible. Mr. Pollard shows very clearly that the real question here was no longer whether the English people were to have a Bible of their own, but whether this English Bible should or should not reproduce, according to the best light of modern scholarship, what was in the originals. This had been the crime of Tyndale—that he had tried to make a really scientific translation; but Mr. Pollard shows that the first authorized version in England was largely based upon Tyndale's work, and that it was Cranmer who succeeded in getting it approved by Henry. In a word, the picture of Cranmer we have here is that of a serious, learned, and conscientious reformer, concerned before all else in carrying out certain definite measures, and willing to overlook all other considerations. It is not precisely an heroic figure; by the side of Thomas More it dwindles into insignificance. And yet, if we compare the constructive value to England of Cranmer's work with that of More, it appears infinitely greater.

The supreme test of character came to Cranmer, as it did to More, when he and the Government were no longer in accord. Mr. Pollard here again resorts to general principles, and does what he can to explain his hero's wild recantations of everything he had professed during his long life. Psychologically we may agree with him that Cranmer was no weaker than any one of the repentant recanters from Peter to Galileo, but the same psychological law was upon More and Latimer and Ridley and Huss—whom Mr. Pollard includes in his list of momentary apostates—and these men gladly faced death rather than dishonor. The heroism of Cranmer's end must always be obscured by the thought that he would have avoided his fate if he could by a craven infidelity to himself.

Mr. Pollard writes pleasantly, with a clear arrangement of his subject, and a fair sense of proportion. Occasionally he presumes too much knowledge on the part of his readers, as, for instance, though he often refers to the Six Articles of 1539, he nowhere tells us what they were. The illustrations, mainly from contemporary prints or portraits, are of the same order of excellence which has marked the other volume of this series.

VEBLEN'S BUSINESS ENTERPRISE.

The Theory of Business Enterprise. By Thorstein Veblen. Charles Scribner's Sons. 1904.

This inquiry into the nature of business enterprise differs, the author tells us, from other discussions of the same general range of facts in respect of its point of departure, or point of view, which is that given by the business man's work. "This choice of a point of view is itself given by the current economic situation, in that the situation plainly is primarily a business situation."

What, then, is this "current situation"? It is the modern industrial system, the characteristic features of which, and the forces by which it dominates modern culture, are the machine process and investment for a profit. Not all industry is carried on by machinery, but in some industries the machine process is paramount, and they dominate the rest. Nor is all industrial activity "carried on by the rule of investment for profits, but an effective majority of the industrial forces are organized on that basis. . . . Those elements in the industrial world that take the initiative and exert a far-reaching coercive guidance in matters of industry, go to their work with a view to profits on investment, and are guided by the principles and exigencies of business." This language we interpret to mean that the "business man," especially the business man "of wide and authoritative discretion," controls the whole field of industry.

In spite of the oracular manner in which these propositions are enunciated, it is difficult to find anything original in their point of view. It is probable that Adam and Eve sewed their fig leaves with some kind of a needle and thread, and endeavored to diminish the sweat of their brows by the use of natural forces, as soon as they were turned out of the Garden. Some philosophers have even distinguished man as an animal using tools, or machines, in order to supply his wants with less pain than he felt when he depended on his muscles. In this propensity, it has been suggested, may be found an explanation of the "view to profits on investment." Capital is itself a tool; it consists literally of tools; and it is employed to obtain a greater satisfaction than would be obtained without it. This gain in results is essentially profit, and the mental state of the capitalist who makes a new investment is like that of the farmer who buys a new plough. It is preposterous to contend that the desire of profits is a modern phenomenon. Before the days of Solomon men were busied in buying, and selling, and getting gain, and Adam Smith had reason for asserting the existence of a natural propensity to barter.

As we read further, however, we find that the "machine process" means more than the use of machines. They are mistaken who suppose that one mechanical process has no relation to another. There is a "running maintenance of interstitial adjustments," and an "unremitting requirement of quantitative precision," which lead to a "gradual pervading enforcement of uniformity," a "standardization" of tools. Men have discovered that when rails are laid four feet eight and one-half inches apart, the axles of cars must have a corresponding length; that it is necessary to have rivets fit rivet-holes; and that shoes and clothes must be made with reference to the dimensions of typical human beings. Trains are operated according to time-schedules, and the traveller must plan to start at a specified minute. All this is true enough, and it is also true that the demands of consumers are to a great extent so uniform that supplies can be produced of a correspondingly uniform character. In this production, too, there must be great uniformity in the services rendered by laborers, in the quantity of muscular force which they exert, and in the time during which it is exerted.

But this is only one view of the situation. Middle-aged people can remember when illuminating gas was a luxury, and when most households depended on candles and whale oil; when there were few railroads and no tramways. Comparatively young men can recall the days when, so far as light and power were concerned, electricity was a mere curiosity of the laboratory. It is true that the fundamental wants of mankind are uniform. We shall always hunger and thirst, and crave warmth when we are cold, and light when it is dark. But in supplying the means for gratifying these de-

sires, the extent of diversification has been prodigious. Invention and improvement proceed with incredible celerity. Myriads of men are doing the same thing day after day; but there are thousands who are incessantly contriving new methods of doing these things, and that which they have done is but earnest of what they shall do. It is easy to talk of the "industrial detriment suffered from any derangement of the accustomed working relations." As a matter of fact, such derangement is both the cause and the necessary result of industrial progress. To "disturb industry" has a bad sound; but it is what intelligent capitalists and intelligent workmen are constantly striving to accomplish, to the great advancement of human welfare.

The impression no doubt prevails that the "machine process" is unfavorable to the existence of independent craftsmen. We hear so much of colossal industries that we are prone to believe that most workmen are gathered into great factories, and that the use of machinery results in "a standardization of the workman's intellectual life in terms of mechanical process." Mr. Edward Atkinson, who has a knack of bringing out facts ignored by the public, has recently investigated the industries of the city of Boston, and tells us that small establishments are predominant, and that the number of independent craftsmen is large and increasing. The distribution of electrical power is favorable to this process of dispersion, and we cannot admit that the use of machinery, even as a part of a comprehensive process, has the moral effects here attributed to it. We must have evidence before we accept the statement that "it is a matter of common notoriety that the modern industrial populations are improvident in a high degree, and are apparently incapable of taking care of the pecuniary details of their own life." This dictum is applied "not only to factory hands, but also to the general class of highly skilled mechanics." We need proof that "the modern workman cannot advantageously own a home." When such premises are assumed, any one can draw startling conclusions.

In order to take what it is not unfair to call the sensational view of modern industry, it is necessary to contrast it with earlier conditions. We must confine ourselves to mentioning a few of the propositions here advanced. In former days the business man had in view not profit, but a livelihood. The modern business man does not stake "his values on the dimly foreseen conjunctures of the seasons." (Publish it not in New York, tell it not in the streets of Chicago!) What he wants to do is to make money; his predecessor wanted to make goods—"an unsophisticated productive efficiency was the prime element of business success." The interests of the modern business man are dissociated from the interests of the community; he loves to fish in troubled waters. "Honesty is the best policy" was the maxim in the past, but it does not apply in the present. Nowadays, true depression in business is not caused by crop failures; for twenty years business has been in a chronic state of depression. Fortunately, depression is not such a serious matter, for the volume of business and the quantity of production may increase nearly as fast as in good times.

We have space for but one more of these illustrations of the "assertatory method." Some have maintained that production is increased by the use of credit; but, according to our author, they are mistaken. "Borrowed funds do not increase the aggregate industrial equipment." Borrowers do not offer full security; lenders accept assets which are not liquid. Loans on stocks, goods, and real estate represent "nothing more substantial than a fictitious duplication of material items that cannot be drawn into the industrial process." "It is a business truism that no banking house could at a moment meet all its outstanding obligations." Probably the conception which the author is trying to express is that debts are not to be counted in estimating the wealth of the community. But to say that borrowed funds do not increase industrial equipment is to ignore the function of credit. Some men have more funds than they can use; others have less; and funds productively used, as compared with idle funds, are a positive addition to wealth. The fact that all the debts of the world cannot be paid on a moment's notice, is of no more consequence than the fact that the great cities would be brought at once to starvation if all the railroads ceased their operations, or that all the cars in the country would not begin to hold the passengers if everybody wanted to ride at the same time.

Although borrowed funds do not increase the industrial equipment, continues our author, they cause the capital employed to be overrated "by the amount of the aggregate deposits and loans on collateral," and this overrating swells the business capital. Capital and credit extension are not distinguishable; capital is equivalent to capitalization. "Trading, under the old régime, was a traffic in goods; under the new régime there is added, as the dominant and characteristic trait, trading in capital." This means trading in "securities," or what is known as gambling in stocks. The "business men," or managers of corporations, if they are shrewd, as they commonly are, will aim to manage the affairs of their concerns with a view to making money by causing the prices of their stocks to fluctuate, not with a view to the welfare of the properties under their control. These business men are not truly speculators; they deal in "sure things"; they are "insiders"; it is the property of outsiders which they bandy about. According to this theory, business consists in watering stock, in capitalizing intangible assets, in "unloading" on the public, in wrecking corporations, and in combining and reorganizing them.

That much "business" of this kind goes on is known to a public that reads of "frenzied finance." But the evidence is insufficient to support the theory that such finance is typical of modern business. Stock-jobbing is on a vaster scale than ever before, but the wealth and the legitimate trade of the country have enormously increased. Many rich and unprincipled men are prominent, but this was probably true when Tyre and Sidon flourished. There has never been a golden age of commercial morality; in the good old times men were quite as unscrupulous and dishonest as now. There are, proportionately, as many producers trying to give buyers their money's worth, as many managers trying to do well by their stockholders, as many bankers trying to supply sound securities to their customers, as ever there were. Such a theory as is here set forth may impress the readers of sensational magazines; but it is a travesty of economics, and an unjust aspersion of our business morality. It may affect the imagination of the half-educated by its ponderous platitudes, its obscure and complicated presentation of simple ideas, even by the barbarisms of the author's style. It may apply to certain notorious phases of modern financial activity; it fails in its assumption that these phases are typical of modern business.

The Royal Academy of Arts: A Complete Dictionary of Contributors and their Work from its foundation in 1769 to 1904. By Algernon Graves, F.S.A. Volume I. Abbayne to Carrington. London: Henry Graves & Co.; New York: Macmillan. 1905. 4to.

This is an admirable labor, generously executed; to be fully appreciated only when we learn that it reproduces but a part of fifty manuscript volumes by the indefatigable compiler, embracing also the catalogues of the early Society of Artists and the Free Society of British Artists, the Royal Society of Painters in Water Colors, the Grosvenor Gallery, the New Gallery, "and various minor public exhibitions." Each volume will have prefixed to it a portrait of one of the successive presidents of the Royal Academy (here, Sir Joshua in a rather poor mezzotint), and blank leaves following each letter for use in continuance by any one so minded. The exhibitors, of course, are not wholly British. Rosa Bonheur appears in this section, along with the Americans E. A. Abbey and Eugene Benson. Women enter on equal footing with the men from the beginning; we have observed 1773 (painting), 1778 (miniature), 1799 (wax), etc. There are two columns of Anonymous, with and without initials. Where portrait subjects are anonymously designated, Mr. Graves identifies as he is able, and in this he has to some extent the aid of Horace Walpole, whose annotated catalogues he has had the privilege of using. The addresses of the artists are copied from the catalogues, and there are truly Bohemian changes in some instances. This is no small service. The price is given if advertised. The titles are repeated in full up to 1800, and what this sometimes means is evidenced in the case of Sir George Beaumont's canvas of 1799:

"Portrait of Elizabeth Woods of Creeting Hills, Suffolk, born of respectable parents in the year 1710, and now living. This singular character, having been by degrees deprived of the greatest part of her house, rather than quit possession, persevered in residing with her two daughters in the remaining ruins, an open chimney and an oven, that served as their storeroom and wardrobe, having nothing to defend themselves from the weather, in a high and bleak situation, but a screen of bushes, which they shifted according to the direction of the wind. Here they lived sixteen years. At the time this sketch was made, the humanity of the neighbors had added a slight shed, and they are, at present, protected from the inclemency of the weather."

This is a true Wordsworthian situation for poetic moralizing, and a real literary

interest is evoked by finding in the exhibition of 1810, by the same artist ("Beaumont, Friend!"), "A Storm—Peel Castle," which was to inspire one of the gems of English verse:

"I was thy neighbor once, thou rugged Pile!"

Another literary interest emerges in connection with W. A. Barron's "Stoke Church," 1775, since Walpole notes: "With Mr. Gray's tomb, now at Strawberry Hill." For if we turn to Mrs. Paget Toynbee's current edition of the Letters, we read in that to Gray's biographer, the Rev. William Mason, of May 7, 1775, from Strawberry Hill (vol. ix., p. 195):

"I have been at all the exhibitions, and do not find that we are got an inch nearer Raphael than we were. . . . My brother has given me the view of Gray's tomb and churchyard, very prettily done, and inspired by Gray's own melancholy. I have hung it here in my favorite blue room, as a companion to Mme. de Sévigné's Hôtel de Carnavalet, and call them my Penseroso and Allegro."

Walpole's annotations are numerous in the case of H. W. Bunbury, and are both critical and laudatory. The art did not solely engage him. Of Jacob Bonneau he remarks that this painter was famous for singing broken English like a Frenchman.

One useful result of this catalogue is in showing how art ran in families, as in that of Bone, which carried on enamel painting in generations ranging from 1781 to 1851. But, of the thirteen artists bearing this name that might have been included in the National Dictionary of Biography, only three actually appear (at least in the index). This comparison, extensively carried out, would afford a pretty picture of the permanent and the transient in Royal Academy reputations.

Antarctica: or, Two Years amongst the Ice of the South Pole. By Nils Otto G. Nordenskjöld and Johan Gunnar Andersson. Macmillan. 1905. 8vo, pp. xx., 608. Maps and illustrations.

At the International Geographical Congress of London in 1895, one result of the increased interest in the Antarctic region was a plan for its exploration by the co-operation of European nations. As this finally worked out, England, Germany, and Sweden took part. To the first was assigned the investigation of the tracts south of the Pacific; to Germany, those south of the Indian Ocean; and to Sweden, the lands and seas lying south of South America and the Atlantic: It was proposed that the several expeditions should leave Europe during the summer of 1901 and spend the following season at some fixed station in the Antarctic region, thus affording a series of comparable meteorological and magnetic observations by which some general ideas of the Antarctic conditions might be had; in addition to such geographical data as might be obtained.

It was no small matter to gather in Sweden from private sources the funds necessary for such a distant expedition. Dr. Otto Nordenskjöld, son of the late illustrious commander of the *Vega* expedition, by unwearied exertions and the aid of others interested in Polar work finally succeeded, though in point of equipment the Swedish expedition could not vie with those of England and Germany under Governmental patronage. The vessel selected was the *Antarctic*, which had already been used on several previous expeditions. The vessel was in charge of Capt. C. A. Larsen, well known as the first discoverer of fossils in the Antarctic lands and for his explorations in that region in 1892 and 1893. Nordenskjöld planned to have his party landed and for the vessel to withdraw, and, under the direction of Dr. Andersson, to engage in scientific work outside of the icy region, until the time came for the party to be relieved. Dr. Andersson, on account of other engagements, could not join the expedition until the return of the ship to the Falkland Islands after landing the wintering party.

The expedition was planned to leave Sweden early in the autumn of 1901 for the South Shetlands, and thence to the partially explored lands already known through the investigations of the *Belgica* expedition and the voyages of Larsen. Somewhere in this region the winter quarters were to be established, where Nordenskjöld and six others would remain. The ship would then return to the Falklands and Tierra del Fuego to spend the season in scientific work there and in the vicinity of South Georgia. On the return of spring, the wintering party was to be called for, the summer spent in energetic scientific work, and the return to Sweden accomplished by the spring of 1903. Somewhat similar plans were laid out by the two other expeditions.

The Antartic summer of 1902-03 proved, however, the coldest, and the ice conditions the worst, ever known since explorations began in that part of the world. The German expedition succeeded, at the very last moment, and, by the most extreme exertions, in extricating itself from the ice and returning home. The English expedition was icebound and obliged to remain for a second year. When the *Antarctic* reached the vicinity, it was found impossible to penetrate even as far as the Swedish wintering station. Those who read the reports of the *Belgica* expedition will remember that their explorations chiefly comprised new lands on either side of a strait, now known as the Gerlache Channel, extending in a northeast and southwest general direction, south of the South Shetland Islands. The lands to the northwest of the channel were chiefly rather small islands, while those to the southeast comprised the continuation of Graham Land, Danco Land, etc., which the explorations of Larsen had shown to form a peninsula, or a range of large islands connected by a continuous ice-cap.

The *Antarctic* reached the extreme northeast end of this peninsula, where the channel named after the ship separates the former land from the Joinville group of islands, connecting the sea to the northward with Erebus and Terror Gulf to the south. As it seemed impossible to force the ship through the ice between this point and the wintering place, Dr. Andersson and two companions were landed with a sledge and supplies at a point called Hope Bay, whence it was thought they could reach the station over the ice; while the ship proceeded to the eastward, hoping to find sufficiently open water to work her way through the pack in that direction. Dr. Andersson's party reached Vega Island about half way to their destination, when it became evident, from the broken condition of the ice with leads of open water, that they could not hope to reach the wintering station. So they were obliged to turn back, and make such provision for wintering at Hope Bay as their outfit permitted.

Meanwhile, the ship proceeded to the east and south, where she was nipped in the ice, crushed, and sunk, leaving Capt. Larsen and his party on the floe, from which, by great exertions and after no little peril, they succeeded in reaching Paulet Island, the southeastern of the Joinville group, where they were obliged to winter without being able to communicate with either Andersson or Nordenskjöld. Fortunately, the seals and penguins afforded a sufficient supply of fresh meat, and blubber for fuel, so that each of the parties was able to pull through the winter without serious difficulty, if with little comfort. On touching at Buenos Ayres to complete their outfit in 1901, the party, at the request of the Argentine Government, had been augmented by Lieut. J. M. Sobral, of the Argentine navy, who proved an excellent and agreeable comrade. During the winter of 1902, in company with Sobral, Nordenskjöld made a sledge journey over the ice to the base of the peninsula of Graham Land, where a latitude of 66° south was reached in about longitude 62° west. This was the extreme southerly attainment of the expedition.

When the vessel did not arrive at the time due, Nordenskjöld's party prepared itself for the second wintering. In the month of October a sledge expedition was again undertaken, this time along the eastern shores of the peninsula in a northerly direction, resulting in the discovery of a large channel between Ross Island and the mainland. More unexpected and remarkable was the encounter with Andersson and his comrades, who had been working southwesterly from their wintering place, and who returned to the main station with Nordenskjöld. On the 8th of November, 1903, the explorers were gladdened by the arrival of the *Uruguay*, a relief ship fitted out by the Argentine Government, under the command of Commodore Julian Irizar, who, with unequalled audacity, had brought his unprotected iron vessel into the very jaws of the floe at Seymour Island. Full of the excitement of preparations for immediate departure, no man slept that night. About eleven in the evening the miraculous happened. Larsen and five companions arrived from Paulet Island! They were as men risen from the dead, since no one had heard anything of ship or men for a year, and even their whereabouts, if living, was a matter of the purest conjecture.

The embarkation; the rescue of the remaining members of the expedition at Paulet Island, diminished only by a single death; their successful return and triumphant reception at Buenos Ayres; the journey home and their enthusiastic greeting on arrival—for these we must refer the reader to the work itself. The story is vividly told, and the quaint English of the translator rather adds to than detracts from the reader's enjoyment and interest. The scientific results will form a series of separate reports. Besides the coöperative set of comparative magnetic and meteorological observations for two years, and the additions to geographical and zoölogical knowledge, the most important result of the expedition is the discovery of a rich

Jurassic fossil flora, a still richer cretaceous marine fauna with numerous ammonites, and, finally, tertiary remains, including bones of a fossil penguin much larger than any now living. These collections will give us some idea of the evolution of Antarctica, and its bearing on the distribution of life in the southern hemisphere, a matter of the highest interest.

The illustration of the work is excellent; the index and maps are all that could be asked. The leader of the expedition has solved the ever-present problem of how can a man write a book on the polar regions, after all that has already been printed, which shall contain anything fresh and interesting; and we tender him on this, as on other accounts, our respectful congratulations.

A History of the United States. By Edward Channing. Volume I. The Planting of a Nation in the New World. 1000-1660. The Macmillan Co. 1905. Pp. xi., 550.

The appearance of a new historical work, however elaborate, is no longer an unusual event, nor is it always, indeed, an important one. A generation of specialists, harvesting monographs by the cartload, has taught us to look with suspicion upon the scholar who does not early choose and forever assiduously cultivate his own small plot, or one who ventures to write the whole history of his country in extended form with the ideals of a man of letters and the conscience of a scholar. Half insensibly we have been led to suppose that such works were to be replaced by manuals, dictionaries, and coöperative histories, which already have begun to appear in more than sufficient numbers. When, therefore, in the face of present tendencies, a first-rate scholar proposes single-handed to write in eight octavo volumes the history of America, the appearance of his initial volume is indeed significant.

For some time it has been clear to scholars that most works on American history are open to two fundamental objections. We have regarded ourselves as a chosen people, whose history, being self-determining, contains within itself its own sufficient explanations; with minds fixed upon our supposed present greatness, we have endeavored to explain events by their results rather than by their causes. With a sure grasp of his subject, Professor Channing has fixed upon the reverse of this as his guiding principle. "I have considered the colonies as parts of the English Empire, as having sprung from that political fabric, and as having simply pursued a course of institutional evolution unlike that of the branch of the English race which remained behind in the old homeland" (Preface, v.). "The guiding idea of the present work is to view the subject as the record of an evolution, and to trace the growth of the nation from the standpoint of that which preceded, rather than from that which followed" (Preface, vi.).

The satisfactory realization of these two principles constitutes the distinguishing characteristic of the first volume. That the author has not treated the colonies in isolation is clear at every point; better still, he has not scrupled, where it seemed needful, to make English or Continental conditions the point of departure, touching upon the colonies, as it were, incidentally. This is especially the case in dealing with the events preceding the settlement of Virginia, to which nearly a third of the whole volume is devoted. We do not know of a better brief discussion of the discovery of America, nor any so good of the intimate relation between the English-Spanish commercial rivalry of the sixteenth century and the English colonizing enterprises of the seventeenth. To Professor Channing the "Genesis of the United States" means primarily the economic conditions in England that led certain classes to seek the New World, and the "Beginnings of New England" are to be found in the rise of seventeenth-century Puritanism—a movement, we are reminded, that was mainly social, and sharply distinguished from Elizabethan separation. Likewise, the chapter on "The Colonies in 1660" is an attempt to indicate the extent to which frontier conditions in New England and the South had already differentiated the institutions of the New World from those of the mother country.

The other principle which has guided Professor Channing, while a well-recognized canon of historical method, needs to be more rigorously applied to the study of American history. Hitherto, students, with some notable exceptions, have too intently regarded the colonies as embryo States. With the great American "experiment" in mind, Virginia becomes, for one writer, the "First Republic"; with the Declaration of Independence sticking in the fringe of consciousness, another readily finds that Massachusetts had already begun the Revolution in the seventeenth century; a third, entertaining preconceived theories of sectionalism, perceives a profound significance in the words "Puritan" and "Cavalier," and is ready to trace the origin of the civil war to the opposing religious and material motives that actuated the settlers of New England and the Southern colonies. Professor Channing, on the other hand, has been content to elucidate what went into the colonies, trusting to find in that the sufficient explanation of what ultimately came out of them.

The most striking result of the rigid adherence to this method is that the political institutions of the colonies are dismissed with a brief, though often a discriminating, treatment. The analysis of the colonial charters is of the slightest; the origins of local government are barely suggested; the persistence of the Virginia Assembly after the overthrow of the charter is assumed, but not traced out in any detail; the evolution of the Massachusetts government from the company is summarized in masterly fashion, but in the briefest possible space. It is significant, perhaps, of Professor Channing's attitude that no use is made of Professor Osgood's special studies of the charters, and no more than a mention here and there is made of his recent volumes, though the fact that they appeared only recently may have made any real use of them impossible. For Professor Channing the colonies were primarily commercial, and incidentally religious, ventures, but in no important sense were they political societies. That they ultimately became important political societies, he will as a matter of course admit; but meanwhile it is unhistorical to ascribe to them a political quality which was apparent only after the event. Such, at any rate, is the point of view of Professor Channing as we understand it; and such undoubtedly is the true point of view. Nevertheless, we feel sure that when the eighteenth century is reached, it will be necessary to analyze the charters and the governmental organization of the colonies much more carefully, in order to exhibit effectively the real character of the Revolution. That, however, can doubtless be done more conveniently in a subsequent volume.

Professor Channing, it is needless to say, has not written his history "from the sources," in the strict meaning of that phrase; it would, however, be a serious mistake to infer that the present volume is not a work of very excellent scholarship. The bibliographical notes at the close of each chapter reveal a comprehensive and discriminating mastery of the sources of the subject. The footnotes, while not extensive, are always adequate, and make it obvious that the secondary accounts have been tested and checked at every point by careful study of the original material. The most enduring impression which Professor Channing's work leaves upon the mind, in this respect, is, indeed, the sense of mastery. One nowhere feels that the subject has been "read up"; one never fears that the author is in danger of being submerged in his material. Nor, fortunately, does excellence of scholarship in this case involve the necessity of slovenly English. Professor Channing's style, if it does not intoxicate, at least does not weary. It follows the subject; it permits one to tell the exact truth. The narration moves easily along, without haste and without rest, devoid of ornament, but not without its quiet humor at times, or now and then a biting epigram. Dramatic opportunities are often suggested (*cf.* pp. 105, 110), but the author resists the temptation, if, indeed, it is a temptation, to make much of them. Everything considered, it is a style excellently adapted to an extended and scholarly narrative of the nation's life.

There are many things in this volume which call for particular mention. It would be a pleasure to comment on the sane reaction from Mr. Brown's deification of the Virginia Company, the independence of judgment exhibited in dealing with Roger Williams and Rhode Island, or the disinclination of the author to make use of technical jargon. There is no "reversion" to the Germanic mark; there is not even an "expansion" of Massachusetts. The very excellent account of Spanish exploration, the minimizing of the difference between "Puritan" and "Cavalier" colonists, the very suggestive discussion of Puritanism—these, also, did space permit, would furnish food for the reviewer. But to do justice to the book it is necessary to read it, and that is undoubtedly what all students of American history will do while awaiting the subsequent volumes, which, we may hope, will appear at intervals not too greatly separated.

Rome. Painted by Alberto Pisa. Text by M. A. R. Tuker and Hope Malleson. London: Black; New York: The Macmillan Company. 1905.

The present book on Rome must be considered chiefly on the merits of its colored illustrations, which are for the greater part

well chosen as subjects, and treated in a picturesque manner, although, as in most instances of the three-color process, there are many failures in the rendering of the delicate tints of sunlit skies, masses of blossom, and other detail. It is evidently the broadest and more definite effects and the simplest treatment which are most telling in these reproductions, and the artists who work for the series should take into consideration the shortcomings of the process. Besides the monuments of Rome, its gardens and villas, its churches and cloisters, all more or less well known, Alberto Pisa has given very characteristic views of the Roman Campagna from Tivoli, and Anticoli, and Subiaco, and interesting bits of mediæval houses in those ancient towns, besides many drawings of the Sagro Speco, the monastery of Saint Benedict at Subiaco, and types of bird vendors, gleaners, peasants, beggars, well known to the traveller as constituting the local color and much of the actual charm of the Eternal City.

To write anything new or significant about Rome is no easy task, so many books have exhausted the subject from every point of view. The present writers skim lightly over the indispensable chapters of its historical aspect, from its origin down to the present time, deriving their data from authoritative sources; but the reader will find their own personal impressions formed by long years of sojourn in Rome of greater interest, for their experience seems to have extended through three papacies, during which time they had opportunities of becoming acquainted with the different classes of the Roman people, and of studying the Roman question in a liberal and detached spirit. In the estimate of the development of the Italian character, our authors note that feudalism, scholasticism, the spirit of chivalry, and Puritanism—four factors which had so much to do in the making of political, intellectual, and moral life in other European countries—never left any impress on Italy, too radically democratic to tolerate feudalism, too open-minded to be attracted to scholasticism, and too self-interested and irresponsible to follow the chivalry of the Frank or the Puritanism of the Anglo-Saxon. Gebhart esteems the greatest Italian gift as "le sens très vif des réalités," a vivid hold on the real, shown in their freedom from hypocrisy and hatred of shams, their desire to see things exactly as they are, recognizing the crudities of sense without concealment, and never establishing lofty ideals too far above them for attainment. Italian development was not on the side of character and conduct, but purely intellectual; to quote our author:

"Italian civilization is imperialistic and social, not individualistic. There is a greater sense of public decorum (as distinguished, however, from private decency) than among us, and more sacrifice of the individual to society. One consequence of this is that there is less of that eccentricity which is the individualism of the poorly endowed; less personal initiative; less enterprise, and nothing of that spirit of adventure which is the Anglo-Saxon's romance."

In quite recent times we are told that it is usual for Italians to attribute their political difficulties to the individualist spirit; but it is rather the want of cohesion and egotism which is at fault.

On the other hand, family life holds a more conspicuous place in Italy than elsewhere. The sacrifices which Italian parents make for their children are considerable, and breed in return a feeling of devotion and reverence which continues through life. One sees in Italy the sons of noble families, with their wives and children, living under the same roof, each having separate apartments in the family palace, all contriving to live under the supremacy of the head of the house. An Italian father cannot alienate his property by leaving it to a stranger; his sense of obligation to those he brings into the world necessitates his providing for his sons equally.

The book under review gives a very graphic account of the street life of the Roman people, domestic service and its difficulties, the Roman nobility and their idiosyncrasies, the relations of the Italian court and the Vatican, and the Roman question in all its phases. All these matters are treated of in a free and easy style, without any pretensions to finality of judgment or complete accuracy; but it seems difficult for English people, however broad-minded, to test foreign countries and their ways by any standard but that of their own. Hence comparisons which become wearisome, though, in this book, strange to say, they are generally unfavorable to the Anglo-Saxon race.

Tuskegee and its People: Their Ideals and Achievements. Edited by Booker T. Washington. D. Appleton & Co. 1905.

Externally, the work of Mr. Washington in the present volume is limited to a fifteen-page introduction. Though his name appears on the cover and title-page as "editor," he expressly disclaims any such editorial revision as had been intended, since the preliminary work of his executive secretary, Mr. Emmett J. Scott, had been so well done as to leave nothing more necessary. And yet the reader will close the book with the impression that in a very vital sense Mr. Washington has written it all. It is the distinctive mark of a great educator that his impress upon the mind of a really intelligent pupil is a powerful element in the thinking of that pupil for ever after. A group of seventeen autobiographical sketches, contributed to this volume by Tuskegee graduates in as many different callings, furnishes just so many striking proofs that, by this test, Mr. Washington is a great educator. The spirit of Tuskegee is in them all, and a most excellent and hopeful spirit it is.

We are told by some that the inevitable result of the work of this institution is simply to fill its students with self-conceit and unfit them for the lowly positions in life to which their racial inheritance naturally assigns them. There is hopeful enthusiasm in each of these brief autobiographies, but it would be hard to point out any unmistakable traces of the pompous self-conceit which a little learning does sometimes give to a small nature, whether wrapped in a black skin or a white. And the hopeful enthusiasm is abundantly justified. Here is a negro boy almost at the very bottom of the scale in the necessaries and apparent opportunities of life. By some mere accident the name and work of Booker Washington come to his ears and waken a desire for something higher than his present state of existence. Penniless, ignorant of the very names of the most elementary studies which he is to pursue, utterly untrained in the ordinary decencies of life, he finds his way to Tuskegee, is put into the night school because he must work with his hands by day in order to pay his bills; finally saves up enough to get into the day school, gets habits of neatness, thrift, self-reliance, and self-respect from his surroundings, and goes forth at last to plant the seeds of all these good things in some benighted neighborhood of his own people, where he sees the seed taking root, growing, and bearing fruit after its kind all around him. Why shouldn't he be hopeful and enthusiastic? Such is about the typical career that each of these seventeen sketches pictures to the reader, and every one of them so stamped with the brand of sincerity that only the wilfully blind can fail to see. And yet this is the very work that some people are telling us is going to spoil the negroes, unfit them for their part in life, and make the race problem only harder to solve than before! We wish that every intelligent person in the land, black or white, might read these autobiographies. No better philanthropic work could be done than the free circulation of two or three of them in tract form by hundreds of thousands.

It is a common thing to charge the negro with laziness and shiftlessness as a distinct and pronounced racial characteristic. The work of Tuskegee raises a question right here. In the early history of the Middle West, when few of the boys who might possibly be interested in college education had wealth, college after college was founded on what was called the manual-labor system, that ambitious young men might be able to get an education and pay their way at the same time by their earnings. In every such case the system speedily broke down, college farms and shops were disposed of, and other ways to help the needy were devised. From the very start Mr. Washington has been able to make manual labor by his students, for their immediate support as well as for the purpose of learning some way to future earning, a distinctive and highly successful feature of his school. Perhaps the laziness and shiftlessness of which we are prone to complain is not racial in its origin at all, but merely the result of discouraging and demoralizing conditions for which the white portion of the people is far the more at fault, and which it should be quick to aid in removing, now that a negro leader has so clearly pointed out the way.

The misconception that Mr. Washington regards mere manual training as all that any negro really needs, or is fit for, is emphatically dealt with in his general introduction:

"The danger, at present that most seriously threatens the success of industrial training, is the ill-advised insistence in certain quarters that this form of education should be offered to the exclusion of all other branches of knowledge. If the idea becomes fixed in the minds of the people that industrial education means class education, that it should be offered to the negro because he is a negro, and that the negro should be confined to this sort of education, then I fear serious injury will be done the cause of hand training."

The race needs leaders of its own blood, he insists, in all the higher walks of life, and must have its colleges for the training of those leaders as well as its industrial

institutes for the great mass of those who are to follow industrial pursuits.

Those who have a practical interest in the maintenance of this great work will find a brief and plain statement from the treasurer as to its resources and needs. Few realize the immense proportions to which the institution has grown. Its annual expenses are now about $150,000, so that the endowment provided by Mr. Carnegie and others covers less than one-third of the necessary disbursements. On the present scale, about $84,000 must be made up each year by special contributions from individuals and charitable organizations. It is needless to say that it takes an immense amount of energy to keep up the steady flow of so large a stream of income from such a source. Two million dollars should be added to the endowment, in order that this energy may be devoted more directly to the work itself. Any one who reads the autobiographies in this volume and learns just what personal contact with the leader means to the students of Tuskegee, will feel at once that it is not right that he should be compelled to absent himself so large a part of the time in order to secure financial support. We shall be much surprised if the circulation of this remarkable volume does not work a change in this respect. It is an unanswerable argument against the critics of the Tuskegee movement in particular and of the education of the negro in general.

Following the Sun-Flag: A Vain Pursuit through Manchuria. By John Fox, jr. New York: Charles Scribner's Sons. 1905.

The creator of 'The Little Shepherd of Kingdom Come,' who is under bonds to write entertainingly, satisfies those bonds in this story of incompleteness. Desirous to see war, and too young for the shock of arms in our rebellion, he failed in his attempt to inspect the carnage in Manchuria, notwithstanding that other observers, who patiently played the game, finally absorbed as much as was good for them He does not take kindly to the fact that in seven months he saw many interesting conditions, but not those that he started out to see. His gravest, and a fairly just, complaint is, that the Japanese authorities not merely procrastinated, but prevaricated. He charges that they held certain correspondents in Tokio for weeks and months, by giving them to understand that they should make themselves ready for immediate departure, with no intention of letting them go. It may be that the correspondent was less important in the eye of the General Staff than in his own; that the General Staff had in mind a definite point in the campaign before he was to be trusted with the troops, and the campaign may have been delayed; possibly, as one star differeth from another star in glory, to the acute Oriental eye the personal equations of all the visitors were not identical. Certainly we have seen that correspondents were at the crossing of the Yalu, the very earliest passage of arms. We do not defend duplicity, but Eastern exigencies may have required an exaggeration of Eastern ways. It is this want of frankness that was the fly in Mr. Fox's ointment, and he found all through the Orient a painful contrast to his more familiar Cumberland mountaineers.

Barring that, we have attractive sketches; no finished picture, but the impression left upon strange eyes by glimpses of our almost antipodal friends. There were amusing and provoking episodes in our author's contact with officers after he did get into the field (but not on the firing line), notably one with a graduate of Yale; the ordinary surprises and discomforts of camp life for a novice, interesting to the victim, but of no earthly concern to others; a white horse with a weak back; an obstinate donkey, a damaged bicycle, an attentive servant. But it is hardly worth while to travel half around the world to make a record of these. The best reading is of the rhythmical click of the wooden getas,

Kara-ko, kara-ko, kara-ko!

whose notes on the stone platforms he finds to be F and D in F minor; of the charming maid of Miyanoshito; the pathetic story of the Eurasian Kamura-san; and a memory of the "opal dream"—the Inland Sea. The two new items that we glean are, that "the height of the Japanese school children has increased three inches within the last ten years in the schools where the children sit in chairs instead of squatting on the floor" (p. 60), and that "many hundred young Chinamen are going over to Japan to get a military training. And yet, according to some observers, there is nothing doing in China—even on the part of Japan" (p. 185).

Mr. Fox in disgust left the field before the battle of Liao-Yang.

Sociological Papers. Published by the Sociological Society. Macmillan Co. 1905. 8vo. pp. 292.

Foundations of Sociology. By Edward Alsworth Ross. Macmillan Co. 1905. 12mo, pp. 410.

"The Sociological Society was instituted [in London] in November, 1903. . . . Its aims are scientific, educational and practical. . . . It prosecutes its work by the means customary to an efficiently organized learned society." We commented last year upon Mr. Galton's brief paper on "Eugenics," a new name for an old study. It was first given at a meeting of this society, and is contained in this volume. The contributions by other members of the Society are well enough, but they evince no laborious research in producing them. The ideas of the essay called "Civics" by Professor Patrick Geddes (not the philologist) appear to us to be, as the Germans say, quite too "schematic," and too heavily loaded with misplaced imagery. One of the best papers is by Dr. Westermarck; but it really needed nothing beyond an ordinary acquaintance with men and women and some reading of books of travel to remark, what (with illustrative facts) constitutes the sum and substance of the piece, that a man's having a legal right to sell his wife or put her to death is no proof that the influence of women is *nil* (quite the other way, we should say); nor is this proved by the whole business of agriculture being in their hands. The one real addition to knowledge that the volume contains is by an outsider, Mr. Harold H. Mann. It is a minute account of life in the purely agricultural village of Ridgmount, where the population numbers 467, and where a large and increasing proportion of the land is the property of the Duke of Bedford. The fullest statistics are given of every imaginable kind, and the individual circumstances of about one family out of every five are described. That is certainly a way of working from which some definite results may be hoped for. At any rate, it shows one indispensable qualification for valuable scientific work.

The interest of the volume is not confined to the papers; for the discussions that followed the readings are reported. In this way nearly eighty different speakers and writers have contributed to the publication, which has a curious interest for an American by showing what sort of timber goes to the construction of an English sociological body, and how English ways of working together differ from American ways. For example, Dr. Karl Pearson, who is not a member of the Society, seems to have attended the second meeting simply for the purpose of hearing Galton read his paper on Eugenics. There is no sign of his having had any *arrière-pensée.* But when he arrived, he was invited to take the chair, which would hardly have happened in this country; whereupon he accepted the honor, which an American would have avoided if it was going to oblige him to declare, as Professor Pearson did publicly declare, as soon as Mr. Galton had done reading, that he disapproved of the existence of such a society *in toto.* He said: "Frankly, I do not believe in groups of men and women who have each and all their allotted daily task creating a new branch of science," and continued for perhaps twenty lines of our columns in this vein, without any mitigation of his condemnation. Every man of science—certainly of any exact science—will say that there is a world of sound sense in the sentence we have quoted, abstractly considered. But, not to mention that (as a vague idea, at least) sociology is *not* a new science, Professor Pearson ought to have seen that the question was not whether the gentlemen and ladies who should join the Society were likely to be so very highly scientific, but whether they would not themselves, in the first place, get much good out of the meetings, and whether, in the second place, they would not create a centre of light and warmth that would surely radiate wholesome influences through the community. "If it adds to their satisfaction," he should have asked himself, "to tell themselves that they are members of 'an efficiently constituted *learned body,*' as their prospectus phrases it, will there be any harm in that at all comparable with the good that is likely to come of it?" When he went on to say that "the history of each great branch of science" shows that it was the creation of some one great man, he simply showed how impromptu and inconsiderate his speech was; for while some of the lesser divisions of science have so taken birth, such great sciences as astronomy, biology, chemistry, electricity, and the like were rooted in the observations of many men who had even less notion of scientific method by far than has the average member of a social-science association of to-day.

The very handsome volume has the appearance of being printed in six or seven different sizes of type, and we have been unable to guess why one man's remarks are printed in quite tiny letters and another's very prominently. We remark that an editorial from this journal appears in

type several sizes larger than that of its original dress, and that Professor Pearson is not reduced to quite the smallest type, such as individuals like M. Rodolphe Dareste de la Chavanne of the Institut de France, Prof. Andrew Seth Pringle-Pattison, Dr. Shadworth Hodgson, etc., have to content themselves with, while Mr. Victor V. Branford's rather tedious reply to Pearson appears in the very biggest letters, far beyond what are accorded to the President of the Society, the Right Hon. James Bryce, D.C.L., etc. Mr. Branford is the secretary.

That there are social sciences—the natural history of religion, economics, political science, the science of human heredity—there can be no doubt. Whether or not there already exists a general sociology apart from the social sciences, is a question too vague to be answered. It is certain that many writers, Dr. Lester Ward, Tarde, Stuckenberg, Lilienfeld, Letourneau, Kovalewski, Benjamin Kidd, Giddings, Alfred Fouillée, Roberty, De Greef—to name promiscuously a few out of many—have worked more or less intelligently in the direction of such a science, although with considerable variety in their conceptions of what it is to consist in. Professor Ross's volume is an endeavor of considerable force in the same direction, and may be particularly recommended as easy to read, brief, comprehensive, and introducing the reader to most of the conceptions of value. The author is a pretty close adherent of the views of Ward, and attributes a more exclusive importance to the conscious desires of individuals than the psychologists would generally admit. The book's greatest fault is the fault of most books on the subject that are now appearing—that of undervaluing work which is too abstract to meet the conditions of a real practical problem; a spirit which would have effectually prevented the development of physical science. It is worth mention that the phrase "race suicide" was first used in one of the papers which make up this heterogeneous volume.

Au Japon et en Extrême-Orient. Par Félicien Challaye. Paris: Armand Colin. 1905.

Among recent books of travel in the Orient, this little volume strikes a refreshingly independent note, as of one who describes what has been not only seen but studied. The author during two years (1889-1901) made his tour as *boursier de voyage* of the University of Paris, and his special quest was to examine European civilization as it reappears in the Orient. Modern Japan (with acknowledged debts to Chamberlain's 'Things Japanese'), Indo-China, Batavia, and India are here subjected to a scholar's scrutiny from this particular point of view. M. Challaye points out that the Europeanization of Japan is not, as is often maintained, a general superficial effect. It is profound as far as it goes, but (and this is the author's chief contention) it is voluntarily limited. The Japanese have willed to accept European influence in certain respects; in others they have opposed and still oppose that influence. They still preserve the essential quality of their ancient civilization. The material life of the people, as expressed in home, furniture, clothing; the sentimental life, the customs, the habits, art and religion—these have scarcely been affected by Europe, and the islanders do not choose to have them Europeanized. Military science, tramways, electric lights, European clothes—these they make use of as tending to make themselves respected abroad. At heart they care for none of these, and as the Japanese with relief doffs his European dress the moment he can, so would he doff all the European innovations, and remains at heart true to old Japan.

A chapter on Vladivostok is rather amusing than instructive. The author, being "suspect," was not permitted to land at all, and the pith of this narrative lies in the naïve expression of personal abuse and indignation at being thus treated. A Frenchman, ally of Russia, not allowed to visit a Russian port? Abominable! But the author has his consolation. He is "proud to endure a little of the persecution which crushes free spirits in Russia." The chief word of interest, however, is a saying of Liebknecht to the author: "He repeated to me several times that Germany is essentially agreeable [*doux*], simple, and liberal; that Prussia alone is cruel, tyrannical, military, because it is in origin more Russian [*id est* Slav] than German."

Mr. Scheltema's recent letter to the *Nation* on archæology in Java is, as it were, here extended into an essay, 'De Batavia à Tosari,' which includes a comprehensive study of the ruins of Boro Boedoer. Here, too, M. Challaye has something fresh and interesting to say in regard to the administration of the country:

"Even if one has quite a different idea of what ought to be the relations between the *métropole* [Holland] and the colony, one can but admire in several regards the sagacity of their polity. More than any other people they have respected local custom, . . . they have resisted the temptation of direct administration. . . . The European in power tries to preserve the appearance of a native government administered by natives. . . . The experience of the Dutch in Java . . . proves eloquently the superiority of a simple protectorate over an unintelligent, complicated, tyrannical, and expensive direct administration."

There is, perhaps, less that is striking in the essays on India, partly because of the way the subject is treated; "Some Men" and "Some Cities" are chapters likely to be sketchy. But even in the most discussed topics the author is not commonplace. Where has the relation between the Hindu's lack of historical sense and lack of national sense been better expressed than in these words: "Ils ne peuvent acquérir l'idée d'une nationalité distincte, puisqu'ils ne savent rien de l'histoire de leur pays: l'histoire est aux peuples ce que la mémoire est aux individus, la condition de la personnalité"?

MRS. HUGH FRASER'S

A Maid of Japan

By the author of "Letters from Japan." $1.25

The Times' Review says:

"It is told with surpassing grace, and possesses in a rare degree both atmosphere and temperament . . . a romantic story that has caught the very spirit of the country. She finely portrays those racial distinctions which are so elusive and inexorable, but she shows between them the essential oneness of the heart of humanity . . . more than the idyl of the sunrise land in a summer sea. . . . The format of the slender volume is a stroke of genius. . . . A book full of artistic simplicity without and within, with genuine value underlying its lightly heaped blossoms of romance."

AN EDUCATIONAL DIRECTORY.

School Trustees, Principals, Teachers,

And others interested, are invited to consider the advantages offered by the *Nation* as an advertising medium. There are probably few weekly periodicals whose columns offer so favorable an opportunity for reaching an audience interested in educational matters. In its special field of political and literary criticism the *Nation* is unlike any other periodical, American or foreign. Going, as it does, to all the principal libraries, reading-rooms, and clubs, and into thousands of the best homes, addressed to the intelligence of the country, the *Nation* finds its readers able and anxious to secure for their children the best educational advantages.

The School List in the *Nation* has been a representative one for many years. It includes cards of many of the most prominent educational institutions everywhere, during the season of school advertising, and a considerable number are inserted in the paper throughout the year.

The rate is reasonable, and discounts are made on continuous insertions, of which most of the school advertisers avail themselves.

The *Nation* is sent free while advertisement continues.

THE NATION, 206 to 210 Broadway, New York.

VOL. LXXXI—NO. 2090. THURSDAY, JULY 20, 1905. PRICE TEN CENTS.

Public Library 350 28 203 Copley Square

Rec'd JUL 20 19 B.P.L.

Professor EDWARD CHANNING'S

"The Planting of a Nation in the New World"

is the first volume of his

A History of the United States

to be complete in eight volumes of from five hundred to six hundred pages each, 8vo, bound in dark blue cloth, with gilt top and title, etc. Altogether a handsome and a valuable library set.

Price of each volume, $2 50 net (postage 27 cts.)

"The guiding idea of the present work is to view the subject as the record of an evolution, and to trace the growth of the nation from the standpoint of that which preceded, rather than from that which followed," quotes THE NATION from Dr. Channing's Preface, and continues:—

"The satisfactory realization of these two principles constitutes the distinguishing characteristic of the first volume. . . . The most enduring impression which Professor Channing's work leaves upon the mind in respect of scholarship is, indeed, the sense of mastery. . . . The narration moves easily along, without haste and without rest, devoid of ornament, but not without its quiet humor at times, or now and then a biting epigram. . . . But to do justice to the book it is necessary to read it, and that is undoubtedly what all students of American history will do while awaiting the subsequent volumes."

The ATLANTIC MONTHLY comments:

"From Professor Channing's beginning it is evident that his will be a standard history. He writes with perfect independence after weighing all the testimony. He is very sober-minded, with a preference for moderate statement, and for reducing legends to their lowest terms. He leans to the critical rather than to the narrative side. As there is in America no historian more careful and thorough than he, and none more loyal to the scientific method, so it is noteworthy that he has given great attention to the literary form of his history. From the promise of his first volume one may predict that he will hold for years to come a position similar to that held by Bancroft in an earlier generation."—WILLIAM ROSCOE THAYER.

RENSEIGNEMENTS GÉNÉRAUX

L'Enseignements de l'École des Sciences Politiques est le couronnement naturel de toute éducation libérale. Chacune de ses grandes divisions constitue en outre une préparation complète aux carrières d'Etat et aux examens ou concours qui en ouvrent l'entrée: (Diplomatie, Conseil d'Etat, Cour des Comptes, Inspection des Finances, Inspection des Colonies), et à des postes d'initiative ou de contrôle dans les grandes entreprises privées.

Les élèves sont admis sans examens, avec l'agrément du Directeur et du Conseil de l'École; il n'ont à justifier d'aucun grade universitaire.

L'enseignement comprend un ensemble de cours répartis en deux années, mais la durée des études peut être étendue à trois ans. Un diplôme est délivré, en fin d'études, aux élèves qui ont subi avec succès les examens.

ANNÉE SCOLAIRE 1905-1906.—L'année scolaire commencera le 6 novembre 1905 et finira le 2 juin 1906. On s'inscrira au Secrétariat à partir du 30 octobre 1905. **Inscription d'ensemble** donnant entrée à tous les cours et conférences réguliers et complémentaires et à la Bibliothèque (environ 25,000 volumes et 160 revues et journaux français et étrangers) ..... PAR ANNÉE: **300 fr.**

Morristown School for Boys Morristown is famous for its healthfulness and beautiful surroundings. Morristown School—a boarding school for boys—has a record for thoroughness in its preparatory work, whether for college, scientific school, or good citizenship. Sports for health and pleasure under unusually good conditions. Trustees: Charles Scribner, President; Rev. Wynant Vanderpool, John I. Waterbury, Carroll Dunham, M.D., William B. Boulton, Grinnell Willis, T. Quincy Browne, Jr., Arthur P. Butler, and Francis C. Woodman, Head Master.

ROCK RIDGE SCHOOL

For Boys. Location high and dry. Laboratories. Shop for Mechanic Arts, *Strong teachers. Earnest boys.* A new gymnasium with swimming pool. Fits for College, Scientific School and business. Illustrated pamphlet sent free. Please address

Dr. G. R. WHITE, Principal, Wellesley Hills, Mass.

BERLIN, GERMANY
WILLARD SCHOOL FOR AMERICAN GIRLS

General Courses in German, French, Literature, Art, Music. Prepares for American Colleges. Foreign travel. Twentieth year opens Oct. 4. For circular address
Dr. ALICE H. LUCE. Auburn, Maine.

The HIGHLAND MILITARY ACADEMY,

Worcester, Mass. 50th year. The Rt. Rev. Alex. H. Vinton, D.D., LL.D., Springfield, **Visitor.** Says a present patron: "The best investment I have ever made was the placing of my sons in your school." Address **JOSEPH ALDEN SHAW, A.M., HeadMaster**

INDIANA, Indianapolis.

Classical School for Girls

Principals: { MAY WRIGHT SEWALL, M.L., A.M.
{ ANNA F. WEAVER, A.B., A.M.

School Agencies.

THE FISK TEACHERS' AGENCIES
EVERETT O. FISK & Co., Proprietors.
4 Ashburton Place, Boston; 1505 Pa. Ave. Washington; 155 Fifth Ave., New York; 414 Cent. Bld., Minneapolis; 533 Cooper Bldg., Denver; 80 Third St., Portland; 203 Mich. Blvd., Chicago; 325 Stimson Block, Los Angeles; Hyde Block, Spokane; 420 Parrot Bldg., San Francisco.

ALBANY TEACHERS' AGENCY. 81 Chapel St., Albany, N. Y.—Provides schools of all grades with competent teachers. Assists teachers in obtaining positions.
HARLAN P. FRENCH, Proprietor.

SCHERMERHORN'S Teachers' Agency. Teachers—Schools—Tutors—Governess—Property. Tel. 6129 18th.
JOHN C. ROCKWELL, Mgr., 3 E. 14th St., N. Y. C.

Teachers, etc.

A WELL-KNOWN COLLEGE PROFESSOR of German, of long experience in teaching, and author of text-books and literary works, desires a suitable position. Apply to F. L. R., care of the *Nation*.

Resorts.

ROSEVILLA, NEUCHATEL, SWITZERLAND Beautifully situated above the lake with wide view of the Alps. Large shaded grounds. A quiet, attractive Swiss Pension. Open all the year. House heated by hot water. Address
Mesdemoiselles Guillaume, Neuchatel, Switzerland.
Or apply for information to
The Misses Kirk, Rosemont, Pa.

Church of the Divine Love,
OXFORD, England
Gentlemen guests received. Plain board, inclusive, six dollars a week.

The Nation.

NEW YORK, THURSDAY, JULY 20, 1905.

The Week.

The President has concluded to send a special envoy to Caracas to study the rights and wrongs of the asphalt claims on the spot. In a matter complex and involved in international recriminations, it is very important that the United States should be right. Naturally, Mr. Calhoun's investigations will touch chiefly the case of the Bermudez Company, whose asphalt deposits have been seized by the Venezuelan Government *pendente lite*. A side line of inquiry, but a fruitful one, will be a possible connection of the Bermudez Company with the recent Matos rebellion. But a close reading of the charter of the company would perhaps abridge this part of Mr. Calhoun's labors. If it should turn out that the company has by its organic deed cut itself off from other appeal than to the Venezuelan courts, then any activity in its behalf by our State Department would be impertinent and offensive. On this point Mr. Calhoun can doubtless inform himself without going to the tropics in the dog days; but if he follows up the whole asphalt matter, and incidentally collects what evidence comes his way about ex-Minister Loomis's commercial activities at Caracas, he will have enough to keep him reasonably in work.

On the same day when Mr. Roosevelt was assuring the Long Island doctors that the Panama Canal must and would be a great success, and affirming that snarling and criticism by good men or skulkers from the front would only lead to better and better plans, he was visited by two labor leaders on behalf of the eight-hour law. Mr. Gompers is quite certain that, even if the statute does not apply to Panama, the principle does, and should be lived up to. The President was, of course, most friendly to the labor men; indeed, he is the bosom friend of every laborer, black, white, or yellow; but he diplomatically had to withhold his decision in the case. The law would add such a very considerable sum to the cost of the canal that the President may well hesitate about granting this favor to the labor men. And if this one were given, where would Mr. Gompers and the others stop? Incidentally, Mr. Gompers wanted to know whether the President's recent orders in regard to the treatment of the educated Chinese entering our harbors meant a lowering of the bars before the coolies. Here the President was on safe ground: so long as the exclusion law is on the books, he can safely say that it will and must be enforced; at the same time there is nothing to prevent his holding the votes and sympathy of the Portland Chamber of Commerce by writing to it how earnestly he hopes to see a thorough overhauling of our Chinese relations by Congress at its next session.

The blameless Panamans are said to be delighted at the combination of Governor and Minister in Mr. Magoun, and evidently it is in the direction of simplicity that within a single cranium should reside our policy both in the Canal Strip and in the Republic of Panama. Thus, the Governor may consult the Minister with only such ceremony as self-respect exacts in a man's dealing with himself, and one may not doubt that a certain continuity of policy will result. On the other hand, one might hold that it is a severe test of human nature to play alternately the potentate and the mere agent. In the course of an evening stroll, Mr. Magoun, without warning of any sort, may stride into autocracy and again veer into subordination. Suppose some time when he returns from an inspection of the Strip he forgets that he has put off the Governor and resumed the Minister. This is a contingency which the liberty-loving Panamans must be prepared to face, and they should certainly provide Mr. Magoun with an official "flapper" to remind him which he is. But the complication possibly eludes so obvious an expedient. The city of Panama is, we believe, in the canal strip for canal purposes, but off it for all other concerns. That is, Mr. Magoun, when he contemplates "the ditch," appears to be Governor of the capital to which he is accredited as Minister, whereas when he turns from the flying dirt to the consideration of the President of Panama, he becomes Minister solely. Clearly, if Mr. Magoun should ever be guilty of confusion of thought or of mere absent-mindedness, the result might be serious for the braves of Gen. Huertas.

To commission Special Junior Ambassador Loomis "to make an investigation of the business methods of the various diplomatic posts of the United States in Europe," as President Roosevelt has done, is enough to make a Rough Rider's horse laugh. Loomis's own business methods have been only partly investigated, but enough was uncovered to make men hold their noses. Apparently, however, the President has not the faintest idea of the disgust with which the country received his exculpation of Loomis. He showers honors upon him as if his character were as white as the driven snow, when all that the people can see is the driven whitewash. It is said that the State Department wishes to devise means of keeping our representatives abroad better posted in the current American diplomacy. But this is the last thing that Loomis should think of stirring up. Our diplomatic agents might be set on seeking information about Loomis himself, and the result could only be to make his welcome cold, even though bearing the President's commission.

Secretary Bonaparte has given his predecessor, Paul Morton, a black eye in the matter of the Charleston navy-yard scandal. The facts are perfectly clear. Two young civil engineers, W. G. Walker and F. R. Harris, made it very uncomfortable for the New York Continental Jewel Filtration Company by insisting that its work at the navy yard be up to the contract standard. Secretary Bonaparte is satisfied that the company finally went to work to secure the removal, through political influence, of these vigilant inspectors, apparently taking the ground—with many another contractor—that Government work may be just what you please to make it. When the political influence reached that master of railroad rebates, Paul Morton, he at once acquiesced in the company's wishes and issued an order removing Lieuts. Harris and Walker from their posts and transferring them elsewhere. Mr. Morton thus served notice on the entire navy that, when it came to standing by honest inspectors or easy-going contractors, the latter had the support of the Department. Secretary Bonaparte at once perceived what a demoralizing effect upon the whole navy this action would have, and has now promptly reversed it in an opinion which should make Paul Morton hang his head, and President Roosevelt wish that he had not been so hasty in adjusting wings and a halo to his beloved, but not regretted, ex-Secretary of the Navy.

If the new Secretary of State shall use as vigorously descriptive language in his state papers as he did on Tuesday in advising Mayor Weaver of Philadelphia to prosecute the ring rascals, the country is in for some rare reading. To speak of the Philadelphia rottenness as a "stain which a corrupt and criminal combination masquerading under the name of Republicans has put upon her," is to use words which fit the case precisely. It must have required some courage, too, when Mr. Root reflected that Matthew Quay, whom, at his death, the President called a loyal friend, and Boies Penrose, the present United States Senator from Philadelphia, whom Mr.

Roosevelt consults on all matters Pennsylvanian, were more responsible for Philadelphia's degradation than any one else. In all this moral uprising, Penrose has been shielding Durham and his kind; his office has been their headquarters, his advice at their service. Towards the cause of decency he has been dumb or hostile, and all the while his adherence to Durham has been used to make the machine's tools believe the national Administration is on the side of the ring. This is no longer possible now. The prompt arrest of Durham and his accomplices, paralyzing as it will be to the politicians, will have no greater effect than Mr. Root's denunciation, his excommunication of them on behalf of the national leaders of their party, and his desire that they be given up to the law even though the regular prosecuting authorities refuse to do their duty.

President Hadley was the inventor of the ostracism cure for corrupt plutocrats, and the epigram has come home to roost in the genial presence of Senator Depew on the Yale Corporation. To be sure, Mr. Hadley has subsequently explained that ostracism is to be applied considerately—one must not always affront the Greeks of modern finance when they bring gifts; but, in view of Dr. Depew's transactions with the Equitable, recently exposed in the testimony which Superintendent Hendricks collected but did not publish, the junior Senator from New York appears to offer the broadest kind of a mark for academic disapproval. As a borrower from the society of which he was both director and legal counsel, he displays, let us say, a carelessness in money matters about as tall as the Chapel Street elms and as broad as the Yale campus. Moreover, as an offender against good sporting ethics, Dr. Depew deserves the thoughtful scrutiny of all Yale men who are solicitous of the honor of their alma mater. No Yale man of our acquaintance loves a welcher, and the borrower who verbally makes himself responsible for a loan and later observes that so informal a promise is without legal weight, comes pretty near the definition of a welcher. On many grounds, Depew's only possible future function at Yale should be that of a shrinking and silent alumnus.

The quarrel between that Sir Lucius O'Trigger of Massachusetts Republican politics, Mr. Eugene N. Foss, and Lieut.-Gov. Guild, the party's avowed candidate for Governor, will bear some explaining. Mr. Foss, who has added to the sin of a firm belief in the principle of reciprocity, the heresy of doubting the divine inspiration of all our tariff schedules, has demanded that Gen. Guild renounce the endorsement of the Home Market Club, which he received a few days ago. He has quoted Gen. Guild's own words, written so recently as April of this year, to show that the Lieutenant-Governor and the Home Market Club can never agree. "Gen. Guild," says Mr. Foss, "has leaped away over the Home Market Club bars by stating flatly that the test of protection should be, not, 'Is a duty demanded?' but, 'Is a duty needed?'" Thereupon the reciprocity champion asks how it is possible for the Home Market Club's secretary, Col. Clarke, to say, in an interview on the Governorship situation, that he did not "believe Gen. Guild's ideas on reciprocity are very different from those held by the Club," or to add: "I don't believe he [Gen. Guild] would be willing to sacrifice one industry for the sake of another. Anyway, as Governor he will have no chance to do it." The progressive Guild of April, thinks Mr. Foss, has been tamed, and it may be necessary, in order to give independent Republicans a chance to express themselves, to enter the race for Governor himself. Meanwhile, Gen. Guild maintains an eloquent silence, and the Douglas Democracy is correspondingly cheered.

It is safe to say that if such testimony as that in favor of Justice Hooker which was given on Thursday by his fellow judges of the Supreme Court, had been offered in a case coming before any of them, or Hooker himself, it would have been ruled out as irrelevant. The issue which the Legislature has to try is not whether Justice Hooker impressed Justice Miller as "fearless, conscientious, and able," or whether Justice Gaynor thinks him "a fine judge and a fine man," but whether he was guilty of certain specified acts. If he was, he should be removed from the bench, notwithstanding the fact that his brother Hirschberg things he has "adequate legal capacity," and that Justice Jenks holds him, "so far as I have seen, entirely honest in his conclusions." All this is as little to the point as is the opinion of that great legal luminary which emits the light reflected from the effulgent Odell—we mean the Newburgh *News*—that the Legislature is bound to declare Hooker's ermine to be without spot or blemish.

The action of the Executive Committee of the Western Union directors in ordering that racing news must hereafter be transmitted only from one regular office to another is a step forward. At the same time it is a confession that the reforms of a year ago were not thoroughgoing. The racing public has still had before it the spectacle of a special operator sending from a special instrument news of value only to gamblers in this city and elsewhere, and the City Club and the Goddard Society must be pardoned if they continue to be skeptical so long as the Western Union retains in its employ the very men who supervised the illegal service, entered into an illegal arrangement with Capt. Goddard himself, and were habitually associated with the gamblers in order to do business with them. While this state of affairs continues, there must remain considerable question whether the Western Union directors are thoroughly supervising their business, and whether their president is wholly aware of what is going on within its own building. So much is clear: if the Western Union seeks to justify itself on the ground that it is the victim of wire-tappers and conscienceless persons who steal its news and telephone messages, the answer is that it is bound to safeguard racing news precisely as it does the business given it by the public.

In Indianapolis has arisen again the question of the obligation of a voter who takes part in a direct primary to support the candidates there nominated. The Republicans, a fortnight ago, adopted the direct-nomination plan in place of a city convention, and ex-Mayor Bookwalter was successful by a small plurality in a count that presented some suspicious features, inasmuch as more Republicans were recorded in the primary than were previously supposed to exist in the whole city. Mr. Bookwalter received a decisive defeat when he sought reëlection three years ago, and presumably the Republicans who voted against him this time entertained the same objections to him as a majority of all the voters had then. Yet his followers are now vehement in insisting that, having been defeated within the lines of their own party, the anti-Bookwalter men are under the strongest moral obligation to support him at the polls. The answer to this is that the direct primary has changed the ordinary voter from a mere endorser of nominations made theoretically by his representatives, practically perhaps by a boss, to the status of a convention delegate. Now dissatisfied convention delegates have not only never relinquished the right to bolt, they have usually taken the lead in any dissenting movement from the party. Experience has sometimes seemed to bear out the paradox that American voters are more disposed to oppose a ticket which they had a hand in making than one imposed upon them by sheer party authority.

By a decision of the United States Circuit Court, the agreement made by a group of the more prominent publishers not to sell books to retailers who cut the "net price," is declared an unlawful combination; and the attempt to enjoin the

corporation of Macy & Co. from selling below the concerted price is declared to be an attempt to force an agreement unlawful in itself upon those who are not even parties thereto. This decision, which seems likely to be confirmed even if an appeal is taken, pretty well annuls the famous compact to maintain a level retail price for all copyright books. First the attempt to cut off the supplies of the bargain-counter places failed; now an injunction is refused in terms attacking the publishers' agreement itself. We can see that the publishing houses which are concerned in the decision had a real grievance, having suffered from the general "dumping" of books as a kind of advertising feature of department stores. It is evident that they thought they were working towards a desirable comity of the trade. Something may be said, also, for the desirability of safeguarding the old-fashioned bookstore from the competition of the new-style book shambles. But these were all more or less sentimental considerations, and not the subject of legal remedy. Publishers cannot hope to escape either the pains of competition or the penalties of combination in restraint of trade, and the old-fashioned bookshop has to suffer the test of other small business. So far as it represents markedly superior intelligence and taste it will continue to find a place in the sun.

One of our contemporaries raises the question whether, after all, the Fourth of July is more dangerous than other days of the year. It suggests that, while a very great number of persons usually engaged in safe vocations or in school spend that day playing with high explosives, this is partly compensated for by the workers in extra-hazardous employments who have a day off. It is not possible to determine this point with absolute accuracy, but some data are available that bear upon it. The census of 1900 gave the total number of deaths in the United States for that year as 1,039,094. But most of these are classified under special heads, ranging from measles to old age, which would not be affected by the Independence Day celebration. The deaths from "all other causes" number 258,166, which must include both the fatal accidents in dangerous trades and the Fourth of July mortality. This averages about 707 per day, Sundays and holidays included. The Chicago *Tribune*, which makes a speciality of such statistics, after waiting due time for tetanus cases to develop, put the death roll traceable to last year's celebration at 468. The figures for this year are larger than those for the corresponding date last year. In either case there must be many unrecorded. We thus have about seven-tenths of an average day's miscellaneous death-roll directly accounted for by fatalities peculiar to Independence Day. Since railroad and steamboat accidents, homicides, suicides, hunting and fishing mishaps, and all the host of similar calamities not only continue, but are probably more frequent than usual on this holiday, it seems clear that the day's bad eminence is deserved.

Mr. Peary seems to have proved that the brave, besides deserving the fair, can find the way to the pockets of our millionaires, and no one will begrudge him his good fortune. He has been a model explorer, modest, scientific, humane, and courageous, and he thoroughly deserves his success in getting the ship and the means for what ought to be a successful dash for the Pole. No vessel which has entered the Polar Seas has been better equipped, and none has had a commander of more varied Arctic experience. And if anything else is needed to achieve success, it is furnished by his naming his vessel the *Roosevelt*. The elements themselves will now give way. Seriously, the best thing about Mr. Peary is that, while anxious to reach the Pole first for reasons of national vanity, his is at heart a scientific quest meant to enrich human knowledge. When one thinks of some of the aimless, ill-judged, and improperly led expeditions now floating around the Arctic, it is a pleasure indeed to wish Mr. Peary and his *Roosevelt* well, as the leading geographers and scientists the world over are doing. At the same time, we sincerely hope his experiment will be the last by sea. The advent of the dirigible balloon is near enough to make us ready to be patient with our ignorance till the problem of the Pole is attacked from the air.

The auguries of peace in the East are distinctly brightened by the substitution of Witte for Muravieff as Russian plenipotentiary. It is not simply that the former has openly declared the folly of the war with Japan. He is a man of peace because he is, primarily, a man of finance and commerce. Just as M. Rouvier, with his financial training strong upon him, started back aghast at the thought of war with Germany, to the edge of which Delcassé had brought France, so Witte, if he had been in power, would doubtless have found a way to satisfy Japan and avoid a war which has put back Russia, financially and commercially, at least a generation. A skilled financier is the last man to be taken in by the transparent fallacy that "war is good for trade." As Witte can see that the war has already thrown down a large part of the commercial edifice which he was largely instrumental in erecting, he may be counted upon to do his utmost to prevent the conflict from going on needlessly and entailing absolute ruin.

M. Delcassé's interview in the *Gaulois* displays strikingly the defects of temper which brought his remarkable career to an inglorious close. He repeats his belief that the German intervention in Morocco was merely a bluff, which, if it were, he should not say; and he discusses with appalling frankness the chances of a naval war between Germany and allied France and England. It is evident that his mind was not upon a diplomatic settlement of the dispute, but upon humiliating Germany, to effect which he was ready to go to the point of war. It is clear also that his mind was not even on France, but on certain large visions of a new European balance. He was willing to ignore the frightful sacrifice France must make on land for success on the sea. A man in this mood may be competent to write a treatise on sea power; he certainly is not in a mental condition to conduct the foreign affairs of a nation that desires peace. In short, M. Delcassé had indulged in Russophilism and then Teutophobia to a dangerous degree, and there was nothing to do but to substitute a cooler head at the Quai d'Orsay. That after M. Rouvier has, by a rather nominal concession, knit up the breach with Germany, M. Delcassé should improve the occasion by using rash words, only emphasizes his discomfiture. It is a curious and inexplicable matter that one of the greatest diplomats of our times should so signally lack the capacity for enduring adversity.

One might wish that King Oscar had complied with the request of the Storthing and nominated one of his sons to the crown of Norway, but this would have required an almost superhuman magnanimity; in fact, it is doubtful if the request was made on any other than a complimentary basis. Failing a Norwegian King of the house of Bernadotte, the suggestion of Prince Charles of Denmark is attractive. It would be a pity if a Scandinavian throne should fall to any of the miscellaneous minor royalties of Europe. With a king of Danish stock, Norway would resume an historic affiliation, and, obtaining the fullest confirmation of her independent status, would be free to enter a Scandinavian alliance. This, in case of a break-up in Russia, would probably include the Grand Duchies of Finland. But, waiving such speculative considerations, it is highly desirable that the uncertainty in Norway should be ended, and, in order to facilitate a Scandinavian compact, a liberal monarchy would be preferable to a Norse republic. From many points of view it is likely, then, that Prince Charles will be chosen. It is improbable that King Oscar of Sweden, who has given a magnificent example of philosophy and practical wisdom in the entire difficulty, will now oppose so excellent a consummation.

THE STATE AND INSURANCE.

Counsels are, as usual, divided on the question of what action the State should take in connection with the Equitable scandals. As usual, too, the politicians are ready to play their tricks. Apparently, Mr. Odell thinks to restore both his moral and his political prestige, and incidentally do Gov. Higgins a mischief, by insisting that the Legislature step in to cure all the ills of insurance companies. There is the customary confusion and working at cross-purposes, and, rising above all, a great clamor that something be done.

One point ought to be kept clear—the difference between investigation and legislation. We think that the Governor is quite right in opposing any new insurance legislation at present. We are not yet ready for that. It will have to come in time; but more light, more deliberation, more careful study of possibilities and consequences, must first be had. To urge the enactment of fresh statutes in the present extra session would be folly. No good could come of hasty legislation, and it might do the great harm of preventing well-considered action later on. The intricate problems connected with the safeguarding of insurance are the last things to be submitted to the perspiring legislators in a July session at Albany.

It is, however, another question whether an investigating committee should not be appointed at once. While there are some obstacles to such a course the arguments for it are strong. The proceedings of a joint committee of the Legislature would have to be public. There could be no more of the mysterious and secret hearings such as, in the event, have done so much to discredit Superintendent Hendricks's inquiry. If ever there was a case for publicity the Equitable's affairs constitute one. Compulsory publishing of itemized accounts would alone have made some of the Hyde milking of the company impossible. As the situation stands to-day, there is no salvation except in making a clean breast. That was not enforced by the Insurance Department; it could be by a legislative committee. Witnesses would have to answer full in the public hearing, or else plead that to reply to questions would incriminate them.

Much more important than this, an investigation by the Legislature could be made more complete and drastic than that of the Insurance Department. The net of a legislative subpœna would catch many a fish that slipped away from Superintendent Hendricks. For example, Mr. Harriman could be called and made to produce that syndicate agreement which, Mr. Hyde testified, he refused to give to that much-wronged gentleman. Mr. Ryan could be summoned, and would doubtless hail the opportunity to explain minutely his intentions regarding the Equitable stock of which he holds the controlling interest, but concerning which his benevolent plans have not been precisely stated. It might even be desirable to give Mr. Root a chance to detail the work he did for the Equitable in 1901 and 1902, when Secretary of War, and for which he was paid, in the former year $10,000, and in the latter $25,000.

Quite apart from such personal trails, which a committee might follow to advantage, there are questions affecting the practical management and the investment of funds of insurance companies, upon which an investigation should threw needed light. How else, in fact, are we to prepare for the corrective legislation that is needed? To thresh out the whole matter by a committee inquiry would be of more direct value than any amount of debating at Albany. What is to be the law affecting directors? Is the present statute, which, literally interpreted, would shut out the most competent directors, to be relaxed or made even more rigid? What regulation of investments by insurance companies is the State to undertake? Do we need fresh enactments to prevent an Insurance Trust, or such financial control of several companies as will enable their vast assets to be used in gigantic railroad speculations? These are but a few of the topics to which an investigating committee might address itself.

We are not of those who credit "the State" with supernatural wisdom. To be informed that a business is "regulated by the States" does not of itself carry conviction to our minds that it is well regulated. The lamentable failure of the Insurance Departments of New York and other States to discover the Equitable crookedness, though they solemnly made successive examinations, is not a powerful argument for extending State functions of that kind. Integrity is a better bulwark than the most stringent statute. Dishonest men who evade one set of legal requirements will manage to get around or secretly violate the new ones. If the business and financial world is infected by a spirit of unscrupulous over-reaching and by morals which admit no test but the goldsmith's scales, it certainly cannot be exorcised by an enactment of the Legislature. Still, it is plain that the State may rightly be asked to do much. Besides prosecuting and punishing criminal financiers, it can lay their entire proceedings bare. A legislative committee can throw its searchlight upon the dark corners of the Equitable iniquity, bringing out what yet remains in the shadow, and perhaps lay the foundation for further criminal processes. Moreover, it can draw out the best legal and financial opinion as to those remedies which it is within the power of the State to apply. Instead, then, of letting everything go over till next January, simply because no wise legislation can be had till then, we should be glad to see an investigating committee soon put to work. It would at least keep public interest alive, showing the people that they do well to continue being angry, and so prevent that consummation which in some quarters appears to be devoutly wished for—a forgetting of the whole scandal, and a quiet settling down as before.

IS GRAFT THE RULE?

President James J. Hill, when asked recently if he thought the recent disclosures of rottenness in the Equitable and other corporations indicated "a low moral tone in commercial circles," took refuge in a proverb: "Water cannot rise higher than its source." What truth Mr. Hill intended to convey, must be looked for at the bottom of his well. The question put to him, however, is one which thoughtful and honest men are asking themselves all over the land. Is it true that "they all do it"? Are those cynical apologists for the Equitable infamies right who contend that Hyde and Alexander and Depew were only doing what other men in similar positions are doing all the time—the only difference being that the latter are too wise to fail out and permit the truth to come to light? Is graft the rule in American business?

That it is at least much more prevalent than they have been ready to admit, we think the most wall-eyed optimists must now concede. The probe has turned up too much too easily. What yet lies beneath we may suspiciously exaggerate, but there must be a great deal. Eminent criminals usually reflect only in a heightened degree the evil spirit of their day and community. When case after case of graft leaps to the light, we cannot be blamed for inferring that there are many others undiscovered. Nor can we blame foreigners for drawing the most damaging conclusions. It is probably the truth to-day that the United States is regarded abroad as crowding Turkey and Russia hard for the championship in corruption. At all events, Japan is now entitled to smile at the homilies which we have directed at her on the need of a higher commercial morality!

But while we will not deny that the evidence of the existence among us of business dishonesty on a fearful scale is strong, we do not believe that it is so universally pervasive as some in their haste have alleged. The secret commission, the betrayed trust, the "rake-off," the doctored records, the "divvy" among financiers very much in the spirit of that of successful burglars, the buying of business, the "legal expenses" which cover a multitude of sins—all are too common, beyond a doubt, and terribly demoralizing, yet they cannot absolutely honeycomb the commer-

cial world. We say this, not out of dogged optimism, nor from a comfortable but delusive conviction that such things simply cannot be in this country, but because we do not, in fact, see commerce and banking fall into a decayed heap at our feet. It was Dr. Johnson, we believe, who said that the devils themselves could not all lie to each other and cheat each other, for, if they did, "hell could not subsist." So we maintain that graft cannot taint absolutely all American business, for, if it did, business could not go on. There must be enough good faith and fidelity and spurning of bribes and hatred of thieving to make, on the whole, a balance on the side of business morality, else business could not longer subsist.

But, to go back to the question submited to Mr. Hill, commercial morality may be low without being fatally debased. And it is our business to look the hard facts in the face, not saying piteously, as Carlyle said certain people do to unpleasant truth, "Thou art not that way, but this way." For one thing, we are bound to admit that corrupt politics has too much had its root in private corruption. Grafting is not first learned in the public business. The opportunities there may be greater, and detection more difficult; but the spirit of getting rich quick at the expense of others and in defiance of the rules of morality, is not confined to the departments at Albany or Washington. In this sense, too, people have the kind of government they deserve. And it is unfortunately true that political reformers are to be deprived hereafter of one argument that they have used. They have urged that "business methods" be applied to politics. But imagine the sneer with which spoilsmen will now ask, "Do you mean Equitable methods?" This, however, simply makes the need of reform broader and deeper. We have got to make business men honest before politicians will be honest; to see to it that the fountain is cleansed before we expect the water to be sweet.

People speak of the "deplorable revelations," but we must be careful what we deplore. That the facts exist is lamentable, but their disclosure is nothing to groan over. It is rather a thing to be hailed. Let us know the worst. Let the diseased bones be laid bare and made ready for scraping. If some great reputations are nothing but whited sepulchres, give the country a sight of the foulness within. If the death's-head of dishonest greed has all the while been a guest at our boasted banquet of "prosperity," it is well, and only well, to let the people have a good look at its grinning jaws. Anything is better than lying complacently asleep in a fool's paradise. These revelations of unsuspected scoundrelism are searching the foundations of our national character. If there are enough men among us who can first give the answer of a good conscience that they are not condemning in others what they allow in themselves, and will then arm themselves with scourges for the backs of offenders high or low, in office or in private life, we shall succeed in putting to flight the army of grafters, and, having recovered our own self-respect, may win back again the respect of the civilized world.

PENNSYLVANIA'S STATE CONSTABULARY.

The Legislature of Pennsylvania, at its last session, passed a law which should be of great interest to the entire country, since it creates a mounted State constabulary for the purpose of preserving peace and order in the rural districts of that commonwealth. State policemen there have been before, notably in Massachusetts, where, however, the system failed. There, the force was not mounted, resembled in its organization that of the cities, and was mainly designed to overcome the negligence and corruption of the local police, particularly with reference to enforcement of the liquor laws. Closely analogous to the new Pennsylvania constabulary are the Texas Rangers, who have performed remarkable service in preventing local disorders, in policing districts laid waste by flood or fire, in running down bandits, as in the Garcia raids of 1891, and in patrolling the Mexican border. Of their value to the State there has never been any doubt.

Pennsylvania as a State has peculiar police problems, not merely because it contains large and wild mountain tracts, but because of the labor problems connected with its vast iron and coal industries. As a result of the great strikes of the past fifteen years, the State has paid enormous bills to its National Guard, which has done more field service by far than the troops of any half-dozen other States. For a time its militia spent almost every other summer in camp. Their work, rather faulty in some respects, during the coal strike of 1902 will be readily recalled. These conditions, with the notorious lawlessness in certain counties, might of themselves have suggested a mounted State police of sufficient size and mobility to control a strike outbreak, at least during its incipiency. But the chief motive behind the Pennsylvania departure is a different and perhaps a less creditable one. Ever since the coal strike there has been very considerable feeling, particularly among the labor unions, against the coal and iron police, a semi-public body supported by the great companies simply because the State had no constabulary, and the local communities were too poor or too inefficiently organized to do their own policing of the masses of foreigners within their boundaries. Much of this feeling is to be condemned—indeed, there were many cases of shocking maltreatment of coal and iron policemen by the strikers; on the other hand, there may well have been unnecessary retaliations on the part of the police. At best such a system is a makeshift, certain to lead to dissatisfaction and trouble. Hence the new constabulary law states distinctly that the men are intended, besides acting as forest, fire, game, and fish wardens, "as far as possible to take the place of the police now appointed at the request of the various corporations."

It is, of course, impossible that this should be done immediately, for the law carries with it an appropriation of only $425,000, and prescribes that there shall for the present be only four troops, comprising each a captain, a lieutenant, five sergeants, and fifty men, or a total, with the attachés of the Superintendent of State Police and his deputy, of about 230 men—obviously too small a body to be other than experimental. The Superintendent is to receive a salary of $3,000, his deputy $2,000, each captain $1,500, and each lieutenant $1,200. Sergeants are to be paid $1,000, and privates $720 a year, and no one is to be appointed to the force until he has passed a physical and mental examination, based upon the police standards of Philadelphia, in addition to which the candidate must be of good moral character, able to ride, and between the ages of twenty-one and forty years. It is a happy augury for the efficiency of this new body that Gov. Pennypacker has appointed as Superintendent Capt. John C. Groome, for years an officer of the historic Philadelphia City Cavalry, a man of means and position, who may be expected to be impervious to political influences. His headquarters are to be in Harrisburg, and he has already announced that he aims to make his little battalion as efficient in its way as the Canadian Mounted Police, which is certainly an admirable model.

If this experiment is successful, as there is every reason to believe it will be, Pennsylvania's action should be imitated by many other States, particularly in the South. One need not recall that Italy and Spain suppressed brigandage and lawlessness by their rural constabularies to see that a system of mounted police is precisely what the South and West need, particularly to suppress lynchings and assaults upon the person in the unpoliced country districts. The sheriff's posse is little fitted to deal with modern conditions, and, in the South, at least, the militia has too often, as at Statesboro, shown itself a weak reed to lean upon. Militarily inclined as the South is in many respects, its militia is small and poorly officered, and has few opportunities for drill and discipline. Some of the money spent on it could well be devoted to a system of patrols for country roads, which, if directed by the proper men—West Pointers, for instance—

would soon pay for itself in increased security, better conditions for rural business, and a decreased expense for the pursuit and confinement of criminals. Being a State force, such a body would be far less subject to local influences than a militia company, for instance; and whenever a Southern Governor really wanted to punish lynchers, he would have a force which would not only fire on a mob, but would run its members to earth as well. Even in New York there could be found plenty of use for such a constabulary, if only to act as a check upon the State officials charged with such duties as those of maintaining order and enforcing the laws relating to the sale of liquor. What Pennsylvania is attempting on such a small scale is a recognized institution in most European countries, and is nowhere more efficient than in Egypt. It is truly singular that the experiment has so long been delayed.

THE PALATE VS. THE EYE.

The story is told that some years ago a Pacific Coast salmon packer learned that there was an excellent market for canned fish among the negroes of the Gulf States, and undertook to secure a share of this trade for his own product. An experienced salesman was therefore sent to Louisiana. He, on finding that canned codfish was the staple, saw an easy task ahead of him. He explained to the shop-keepers how much richer and more toothsome his salmon was, and they accordingly laid in a stock and recommended the goods to their customers. But it appeared that the codfish with which those same customers were familiar had the habit of turning rusty when old. Red flesh had with them come to mean unfitness for food. The buyers opened the cans, found the contents red, threw them away, and refused to buy any more. The skilful salesman's further efforts were unavailing. But there is taken among the high-grade salmon an inferior fish known as "dog salmon," which the canners had previously thrown away. Its flesh is coarse and fat, but it is white, and, what is more, stays white indefinitely in the can. So the canner, whose first attempt had failed, began to put up "dog salmon" for this same trade. He labelled his goods, "Warranted not to turn red with age," and was rewarded by well-deserved success in the places which would have none of his high-grade wares.

Whether this story is actually true or not, there is a very important moral in it. It is that there is no use trying to make people eat anything that does not conform to their ideas of what viands should be. A Government pamphlet on "Consumers' Fancies," emanating from the omniscient Department of Agriculture, and credited to George K. Holmes, chief of the Division of Foreign Markets in the Bureau of Statistics, eloquently enforces this lesson. Here are rapidly run over most of the commoner whims relating to the appearance of articles for the table. Thus, brown eggs sell for a higher price than pure white ones in Boston, while New York and San Francisco prefer the white; butter colored to suit Chicago's taste would be too pale for that of Washington, and not nearly dark enough for New Orleans. And, in a long list of the most familiar articles, the consumer demands a color or appearance which, not only is no indication of quality, but is actually absent in the pure natural product. Catsup made from tomatoes is not a vivid red, and must be made so, in very many cases, by dyeing. Cider as it drips from the modern mill is almost colorless, but the buyer, remembering that the old-time cider and vinegar were brown, demands that the new wear the same color. The maker meets the demand with caramel. Whiskey is in similar case. As it comes from the still it is white, and the darker color results only after it has been stored in a charred barrel. This tone can be given to white or undercolored whiskey by means of burnt sugar. Prunes are dipped in glycerine and logwood, walnuts bleached with sulphite, because people believe that they ought to look as nature never intended they should. Obviously, the refusal of the public to buy the "real thing" just as it comes is the greatest imaginable incentive to adulteration and fraud.

But short of these actually fraudulent practices, the unreasoning preferences of the consumer work to his own detriment. Take the single example of fruits. In none of the homelier departments of life, perhaps, is there so much bewailing of the good old days. The apple, peach, plum, pear, cherry of our forefathers has been succeeded by an insipid pulp. Yet the cause for this, or at least one of the important causes, can be readily traced. Look, for instance, at the system of marking which prevailed at the Louisiana Purchase Exposition. In judging apples, 15 points were given to size, 15 to color, 15 to form, 20 to freedom from blemishes, and only 15 to taste. In peaches, 25 points were counted for quality to 75 for appearance; in pears and plums the same. The quality of cherries counts for 20 points, though the mere item of "stems" is worth 15. In the scoring of grapes, again, 80 per cent. is on qualities that appeal to the eye, to only 20 that concern the palate. The fruit-grower rightly values the awards made at a world's fair, or even a horticultural show, or a county fair. To say that such and such a variety of fruit had taken first prize would generally be regarded as the highest recommendation. Yet if our markets are filled with showy but tasteless fruit, the reason is not hidden.

The talk about Mr. Burbank's seedless apple is in point here. As soon as this discovery—or, rather, rediscovery—became known, people caught at it with enthusiasm. They cracked jokes on the "Ain't goin' to be no core" order; they promptly predicted the complete disappearance of the apple with seeds; they wondered how soon the seedless sort would become cheap enough to buy; they organized companies to raise it, and sold stock to the unwary. The only thing they did not do was to inquire what the new fruit tasted like.

The conclusion is inevitable, moreover, that as city life becomes the lot of an increasing number, and our population gets farther from the soil, this ignorance of an insistence on qualities properly unimportant will be heightened rather than otherwise. Starting from our days of dietetic simplicity and virtue, the proper and logical course should have been to insist on keeping up absolutely the flavor and wholesomeness of every product, while encouraging such efforts at attractiveness as caused no deterioration in the other line. As things have turned out, our only hope seems to be in in praying for such improvements in flavor and wholesomeness as will not interfere with the all-essential externals.

THE CRISIS OF INDUSTRIAL ARBITRATION.

SYDNEY, June 19, 1905.

If Dr. Victor S. Clark, whom President Roosevelt last year commissioned to report on the working of industrial arbitration in New Zealand, had continued his voyage to Sydney on the steamer that brought him from San Francisco, he would have found in the neighboring State of New South Wales a system in active operation that would have challenged a still closer scrutiny. He would have found being administered a statute in which the characteristic principles of the New Zealand act are unflinchingly carried to their logical issues. He would have seen a court where the president, with remarkable perspicacity, has still further developed those principles by his decisions, and has aimed at building up a code of industrial law as Lord Mansfield built up a code of commercial law; and where two lay assessors have shown equal independence and acumen in asserting the rights of the employers and the claims of the employed. He would also have observed the court daily assailed by a running fire of destructive criticism that left no single feature of the act unscathed.

Had he visited Australia a year later, he would have witnessed a very different state of things. He would have found the whole imposing structure of State industrial arbitration in ruins. At the end of the term of three years for which he was appointed, the president has refused to enter on another term. His reasons for taking this are no mystery. The profession he belongs to is all but unanimous against the act. The chief justice has denounced it as an invasion of the liberty of the subject. The Court of Appeal in the State and the High Court of the Commonwealth have taken a

vindictive pleasure in reversing the judge's most characteristic decisions. The society that he moves in is savagely contemptuous. The press is implacably hostile. To continue in office would be to sacrifice his peace of mind. But that is not all, nor the worst. The statute requires that the president of the court shall be chosen from the judges of the Supreme Court. But no judge of the Supreme Court can be induced to accept the invidious position. Nor can a judge be appointed *ad hoc*. Fourteen years ago, after a colonial escapade, the Privy Council decided that no new judgeship could be constitutionally created till the Legislature had voted a salary for it. There is, therefore, no loophole in that direction. The court, as the president admits, is "in a state of suspended animation." It no longer sits. The men cannot strike, for that is now an indictable offence; the masters dare not lock out, for that also is a misdemeanor; and neither can appeal to a court that has virtually ceased to exist. We are reminded of an English parallel. Forgetting the existence of Mr. Goschen, Lord Randolph Churchill rashly imagined that, by merely resigning his office, he could bring the Salisbury Ministry to its knees. Using the same simple but (this time) effectual procedure, Mr. Justice Cohen has undesigningly brought industrial arbitration to a deadlock.

To what is it owing that the favorable auguries that attended the inception of the system have been mocked and the sanguine forecasts of its success have turned to disappointment? To one thing exclusively. It has been perverted from its original purpose of being a method of conciliation in industrial crises, and converted into an instrument for the minute and detailed regulation of all the industries in the colony or State. The design of the New Zealand or mother statute we know on authority. In 1894 the author of the bill asked the House of Representatives to legislate in order "to prevent that class of labor disputes which cause loss or danger to the community—loss to those concerned, and danger inasmuch as they may arrest the processes of industry." The act came into force in the following year. Three years only of its operation sufficed to open the lawmaker's eyes. In 1898 he wrote that the act was in danger of being ridden to death. Three years more passed away, and the head of the Ministry that carried the bill was aroused to mingled anger and alarm by the avalanche of litigation that it had brought down on the colony. He made a strong protest against the continual summoning of employers. Repeating the words of his own Minister of Labor, he said that the men were riding the act to death. They were keeping the community in constant turmoil. A stop, he sternly intimated, would have to be put to the incessant litigation, or it would disgust both masters and men, and excite a revulsion of public opinion. One after another, in New Zealand as in New South Wales, every industry in the colony has got up an "industrial dispute" and presented a case on which the court is bound to adjudicate. A court that was expected to sit only in emergencies is kept perambulating the colony, and deciding suits from one end of it to the other. It was created to redress only such intolerable grievances as would have led to a ruinous strike or a dangerous lockout, and it has been insensibly dragged into regulating all the conditions of every industry. Initiated as a system of industrial arbitration, it has been distorted into a system of State industrial regulation. The reader of the official reports is astonished to see page after page filled with minute prescriptions, relating to wages, time, apprentices, conditions of labor, and modes of work, drawn up by a judge, an employer, and a workman, of whom the lawyer might not be the most ignorant of the particular industry. No more pungent example could be given of the truth, first enunciated by Machiavelli and reiterated almost to wearisomeness by Spencer, that the course political innovations will take cannot be foreseen or their effects measured in advance.

The means have been as much perverted as the end. The author of the New Zealand act expressed the belief that the voluntary institutions it sanctioned or created would suffice for settling the great majority of industrial disputes. This is clearly the ideal to be aimed at, but it has never been even temporarily realized. After maintaining a struggling existence for seven years, the New Zealand boards of conciliation were practically superseded in 1902 by an amending act permitting suits to be carried straight to the court of arbitration. In none of the Australian States have the boards been brought into existence. Conciliation has disappeared from the system, or has never been introduced into it. Industrial agreements remain. They are the bequest of the motherland to her colonial offspring. The greatest industries in England are now governed by a method of collective bargaining that regulates their conditions down to the minutest particular. They would realize the individualist's ideal if they were provided with that legal sanction which an influential minority of the royal commission on labor recommended some years ago. It is provided by the New Zealand and the Australian acts. These statutes confer on industrial unions the power to make collective agreements. A union of employers and a union of workers may form compacts for a period not exceeding three years that shall be binding in law and enforced like a decision of the court. Masters and men meet in conference, and their agreements "are arrived at after prolonged discussion on the give-and-take principle." Once they are arrived at, the court shows the utmost unwillingness to disturb them, conscious of its inability to appreciate the succession of compromises that led up to them. Unfortunately, the conclusion of an agreement is an exception and the hearing of a dispute the rule. In New South Wales only eighteen agreements were filed in about as many months, while forty-six disputes were set down for hearing.

How far from conciliation or the amicable settlement of differences are the thoughts of the labor leaders appears from the battle that rages around the cornerstone of the statute—the so-called preference to unionists. The controversy first broke out in New Zealand, where the judge of the court of arbitration ruled that, in employing or dismissing workmen, an employer must prefer unionists to independents. An appeal was made to the full court, which condemned the principle by the mouth of the chief justice, but confirmed the ruling on the ground that unions alone and not individuals had a standing before the court. The Legislature promptly placed the matter beyond the reach of litigation by enacting that the court was authorized, should it think fit, to give a preference to unionists in any industry. The Premier of New Zealand is now urged to make preference compulsory by statute. He provisionally declines to take that extreme step, but asserts that the colony should be "educated up to" that ethical elevation. The New South Wales law has from the outset unequivocally authorized, but not required, the court to concede preference. The interstate arbitration bill that wrecked two Ministries in the Commonwealth, and hangs like the sword of Damocles over the trembling heads of a third, at first followed the lines of the New South Wales act. Then an amending clause was proposed permitting preference to be granted only when it had been definitely ascertained that a solid majority of the workers in any industry approved of it. The Labor Ministry fell in opposing the amendment, which was carried by the scanty majority of two. The struggle has been transferred to the civil courts. Some months ago the court of arbitration in New South Wales held that an employer is not justified in engaging non-unionists without applying to the employees' union to learn whether competent union labor is available. It also held that it "had power to direct that a non-unionist seeking employment shall, as a condition precedent to his obtaining it, agree to join the union within a specified time after his engagement." Both of these developments have been set aside by the State Court of Appeal. A few weeks ago a puisne judge in Queensland (where State arbitration has not yet been introduced) awarded heavy damages to a non-unionist who had been deprived of work by a union. Yet there is nothing new in the labor contention. The statute only gives effect to an old practice. For many years employers have been granting a preference to unionists. Without it, the president of the court declares, unionism is at an end. Accordingly, preference forms a part of almost every award. The effects of the provision are not doubtful. (1) In any trade where a preference is legalized, "workmen in that trade," says the registrar of the court, "must either join a union or be in danger of starvation." (2) A non-unionist cannot obtain legal redress. "It is only as a member of an industrial union," he adds, "that a workman can apply to and be represented before a court." The president holds that no employer has been injuriously affected by the preferential clause. Perhaps not; will he say as much of the employee? Not only is the workman driven into the union, but he becomes a member of a political organization. He must contribute to the parliamentary expenses of the political candidate selected by the union; and he is liable for levies made in support of strikes in other States. He is no longer a free agent—and that in colonies which are largely populated by independent workmen who left the old country to escape from the tyranny of the unions.

Even these *Vehmgerichte* might be tolerated if the system of which they are the base thus gained its chief end—the suppression of strikes. To all appearance it has done so in New Zealand, where there have been no strikes since its inception; but then, except a gigantic strike in sympathy with Australia, there was none before. It has

been otherwise in New South Wales. Here have been lately as many as eleven strikes in the short space of seven months—most of them, it is true, in connection with that coal-mining trade which is the cockpit of industrial contention all the world over. When a twelfth broke out a few months ago, the authorities considered that it was time to set the law in motion. A number of representative delinquents were selected and prosecuted. The prosecution issued in a fiasco. Some of the cases, on a technical pretext, the magistrate refused to send before the jury. Others the jury threw out. The crown prosecutor then abandoned the rest.

Criminal prosecution is evidently futile. An offending employer can be at once brought to his senses by a heavy fine of £500, while a workers' union goes scot-free because its funds cannot be got at or because it has no funds. To imprison the offenders in many a strike would much more than fill the gaols of the State, and to imprison a few would be to make martyrs of them. Effective against the masters, the system is powerless against the men.

This is only a part of the price the employers have to pay for industrial peace. The charge made against arbitration, as it is being administered in New Zealand and New South Wales is, that it is taking all businesses out of the hands of their owners and vesting them in a court of law, which thus virtually controls the entire industrial organization of the State. Need we wonder that, in the execution of this stupendous undertaking, the courts have completely broken down? Four years ago it was stated that the boards of conciliation in New Zealand were a year behind with their work, while the Court of Arbitration was hopelessly in arrear. The New South Wales court is still more congested. Some of the unions have waited two years and a half for their cases to be heard, and many have had claims pending for two years. In despair the president announced that in future the court would confine itself to questions of time, wages, preference to unionists, and the application of "the common rule." It has not availed. At this moment sixty-three cases stand on the roll for hearing, and a representative of labor has computed that, at its recent rate of progress, the court will consume thirteen years in overtaking them.

Do not these instances at once show the error that has been committed and point out the path of reform? The more strenuous opponents of the act clamor for its immediate repeal; its more judicious critics demand only that it shall be allowed to lapse when its term of probation has come to an end. Let no man expect to witness either consummation. The conquests of the Australian democracy are inalienable. The English divorce act was carried in the teeth of a determined Opposition led by Gladstone in a series of impassioned speeches. Does any one believe that the divorce procedure will ever be excised from British jurisprudence? Had that court, instead of dealing only with cases that have come to "suppuration point," attempted to regulate the matrimonial relations of all England, it would have made the same mistake as the courts of arbitration at the Antipodes. Let these refuse to adjudicate on any industrial dispute save such as would inevitably lead to a lockout or a strike, and their business will be reduced to manageable dimensions, while masters and men will agree to settle all other differences between themselves. J. C.

Correspondence.

GOETHE ON BLOOD-AND-THUNDER FICTION.

To the Editor of The Nation:

Sir: While browsing lately among Goethe's "Sprüche in Reimen," I came across the following epigram, which brought back to me an extremely interesting review that appeared some time ago in the *Nation*, wherein the tendency of the modern historical novel, with its wholesale adventures, and thrilling murder and robber stories, was severely criticised, and to which a recent article in the July *Atlantic*, "The Mob Spirit in Literature," likewise points:

DEN VEREINIGTEN STAATEN.

Amerika! Du hast es besser
Als unser Continent der alte:
Hast keine verfallene Schlösser
Und keine Basalte.
Dich stört nicht im Innern
Zu lebendiger Zeit
Unnützes Erinnern
Und vergeblicher Streit.
Benutzt die Gegenwart mit Glück,
Und wenn Eure Kinder dichten,
Bewahre sie ein gut Geschick
Vor Ritter-, Rauber- und Gespenster-Geschichten.

This, feebly translated, runs as follows:

TO THE UNITED STATES.

America! thou farest better
Than our Continent of ages:
Thou hast no ruined castle, no weather-beaten prison cages.
In the present thou livest,
And carest not, nor givest
Needless thought to the past,
Or things that do not last,
Enjoy the present, and if in time
Thy children take to writing prose or rhyme,
God save them from writing much
Of tales of knights, robbers, mysteries, and such.

Goethe is said by his biographers to have written most of these "Sprüche" during his first Italian visit, 1787-8, some ten years after the Declaration of Independence. His mind then was evidently full of hopefulness for and admiration of the new political, but apprehensive of the new literary, republic. It is as though this seer had foreseen, more than a hundred years ago, the sorry spectacle which some of the modern novels present, and warned us against it.—Respectfully, W. T.

St. Louis, July 15, 1905.

DR. J. L. A. BRANDES.

To the Editor of The Nation:

Sir: Last month, the hospitality of your columns being extended to me for a few remarks on "Archæology in Java," the subject necessarily led to my speaking of Dr. J. L. A. Brandes as the moving spirit of the present activity in that field. Though I was informed of his intention to ask a year's leave to visit Europe, principally for the sake of recuperating his health, which had suffered lately, the news of his death (at Batavia, Java), received by the last mail from Holland, was very unexpected. Doubtless the news will be of interest to the *Nation's* readers, and may be supplemented by a brief notice of his lifework in the short space allotted him (he died at the age of forty-eight).

Born in Rotterdam, he graduated at Leyden, as a pupil of Professor Kern, and in 1884 got an appointment to Netherlands India for the "study of the native languages" as a Government official. Very soon, from his special training and inclination, he felt attracted to the deciphering of old inscriptions and manuscripts, and to investigations connected with the history of the old Hindu monuments, and I well remember his delight when receiving, in 1886, copies (*Abklatsche*) of some inscriptions I had made for him on the Diëng plateau. As curator of the collection of manuscripts belonging to the Society of Arts and Sciences at Batavia (*Bataviaasch Genootschap van Kunsten en Wetenschappen*) and representative in Netherlands India of the Royal Institute at The Hague (*Koninklyk Instituut voor de Taal-, Land- en Volkenkunde van Nederlandsch Indië*) he gathered and examined a good deal of material, and the results of his labors may be found in the Proceedings of the above-named learned societies.

After the annexation of Lombok, Brandes was sent thither for the purpose of saving such of the treasures in literature, architecture, sculpture, and other branches of art as survived the devastation of the island during a cruel, obstinate war. Some time before, after the death of Dr. van der Tuuck, he had been sent to Bali for the purpose of taking possession, in the name of Government, of the scientific estate left by that most distinguished, most erudite, but most eccentric linguist; and it is a matter of great regret that this tremendous mass of material, collected and, to a certain extent, put in shape for a standard dictionary of the Balinese language, now lies unused, practically shelved, the almost gigantic labor of a lifetime spent in conscientious research helplessly thrown away—unless the future produces a similar scholar of the right kind, willing and capable of taking up the work where Van der Tuuck left it.

The principal work of Brandes, during the latter part of his life, with the exception of some publications relative to the topography of ancient Batavia, was done on archæological lines, for the preservation of the Hindu monuments in the island of Java. His influence as president of the archæological commission was set forth in the *Nation* of the 15th of June, and may be further traced in the printed results of his investigations regarding our Hindu antiquities, the first volume of which (and the only one published so far) treats more especially of the Tjandi Djago. Earlier, he wrote the *Nagarakretagama* and the *Pararaton*, or the books of the Kings of Tumapel and Madjapahit, besides an index to the *Babad Tanah Djawi*.

Representing Government at the Congress of Orientalists in Hanoi in 1902, he drew attention to many points of resemblance between the architecture of the old monuments in Java and Bali on the one hand and in Indo-China on the other, while his studies had led him to the opinion that the old Hindu civilization which came to Java from the continent, first centring in the middle of the island, gradually spread east and west—most intensely to the east.

Altogether, however much he accom-

plished, Brandes gave promise of infinitely more, on the basis of ever-widening views, ripened by restless investigation within strictly defined scientific limits, A sober-minded, yet enthusiastic scholar of the old school, preferring solid knowledge to brilliancy, his untimely death must be counted a great loss. J. F. SCHELTEMA.

NEW HAVEN, CONN., July 13, 1905.

A REPUDIATION.

TO THE EDITOR OF THE NATION:

SIR: My attention has been called to a publication calling itself "The Bibliophile Library of Literature, Art, and Rare Manuscripts," and bearing the imprint of "The International Bibliophile Society." My name is used as one of the editors.

I wish to state emphatically that I have never been engaged by any International Bibliophile Society to edit any such "Library." I have the honor of being president of the Bibliophile Society, the publications of which are distributed *only* to members. It is not in any way a mercantile association; it consists of five hundred of the most enthusiastic book-lovers in the country. On its Council are men like the Hon. Henry Cabot Lodge and Prof. William P. Trent of Columbia University. Through the courtesy and unselfish zeal of one of its Western members, it has been enabled to issue an unprecedentedly valuable series of books of literary and historical interest, such as 'Major André's Journal,' Marat's 'Lettres Polonaises,' and the like. The so-called International Bibliophile Society is apparently trying to trade on the reputation which our society has legitimately won. Its methods, as frequently brought to my notice by friends, are fraudulent and outrageous, and I have been advised to bring a legal injunction against their persistent use of my name, the only shadow of an excuse for which is the fact that, some years ago, I outlined a plan and helped to compile the "International Library of Literature," which was published by Merrill & Baker. The plan, embodying a combination of topical and chronological arrangements, thoroughly educational in character, was at one time attributed to Dr. Garnett, who promptly repudiated its authorship, and joined with me in a protest against having his name in any way associated with this same pseudo-International Bibliophile Society, though he is an enthusiastic member of the genuine society.—I am, sir, yours, etc.,

NATHAN HASKELL DOLE.

OGUNQUIT, MAINE, July 12, 1905.

Notes.

The Saalfield Publishing Co. of Akron, Ohio, will publish directly a 'Life of Edwin M. Stanton,' by Frank A. Flower, with many illustrations.

Eleven years ago the house of Hachette in Paris, on adding Pascal's 'Pensées' to its "Collection des Grands Écrivains," solicited subscriptions for a phototypic facsimile reproduction of the manuscript original preserved in the Bibliothèque Nationale, which proceeded from Pascal's relative, the Abbé Louis Périer. This hodge-podge is a scrapbook of an exasperating kind, in which recto is sacrificed to verso in pasting, and vice versa, yet with nothing put out of sight or lost. The undertaking involved not only the facsimiles, but a word-for-word transcription—not, however, in the orthography of Pascal's time, but in that of the present day, for purposes of mere comparison. Over this part Professor Léon Brunschvicq has presided. The form of this splendid reproduction is folio. The facsimiles are absolutely untouched. There will be some appendices, notably an unpublished letter of Pascal's to Huygens, January 6, 1659, preserved at Leyden.

The German South Polar expedition in the *Gauss*, to which we made reference in our recent notice of the Swedish 'Antarctica,' is about to have its historian, viz., in the person of its chief, Erich von Drygalski—'Deutsche Südpolar-Expedition 1901-1903' (Berlin: Georg Reimer; New York: Lemcke & Buechner). The work is generously planned, and will appear under the auspices of the Imperial Minister of the Interior, in ten volumes of text and three of atlas, not to be completed till 1912. The text illustrations will number 1,400.

From the same New York firm we have parts vii. to xii. of the handy and excellent 'Meyers Hand-Atlas,' already described in these columns as passing into a third edition. The South Polar regions occur in the present instalment, as also the North Polar. Among novelties we remark a map of Kiao-chau Bay, one of Argentina, Chili, Bolivia, Uruguay, and Paraguay, others of Morocco, Algeria and Tunis, of the coast of Ukraine, the environs of Rome, etc.

The second volume of Luther S. Livingston's 'Auction Prices of Books,' in English and American salesrooms from 1886 to 1904 (plus some earlier quotations), comes to us from Dodd, Mead & Co. It extends from Dickens to La Peyrère. Here one may observe Rossetti's four-part *Germ* germinating in market value to $410, to $675. Here is Fielding commanding $200 for his 'Amelia,' as against $345 for Franklin's 'Catalogue of Choice and Valuable Books' and $565 for his 'Poor Richard.' For Gray's 'Elegy' $740 was none too high; but his 'Six Poems' of 1753, with manuscript insertion, towered to £400. Some modern contrasts are presented in the case of Edward FitzGerald, who goes not beyond £31 for his 'Salámán and Absál,' and of Kipling, who fills a large space, with a climax of £400 for his 'Schoolboy Lyrics.'

The tourist season is certainly appropriate for the bringing out of a new edition of George Borrow's 'Wild Wales,' as has been done by John Lane for his "New Pocket Library." It bears on every page the stamp of the eccentric author, and is interested alike in the people, the language and scenery—in scholar gypsy fashion. There are more than 700 pages in the chunky little volume, but the chapters are brief and the conversations and descriptions fascinating. Whether bound for the principality or for quite another outing, one cannot go amiss in slipping 'Wild Wales' into his bag and into his pocket.

Dr. Hyslop's 'Science and a Future Life' (Boston: H. B. Turner & Co.) is, like the little book by M. Sage, which we noticed last year (No. 2040), an attempt to popularize and condense the evidence buried in the Society for Psychical Research's voluminous reports on Mrs. Piper's trances, for one of the bulkiest and most detailed of which Dr. Hyslop was himself responsible. He has added to his extracts some sensible comments and a careful comparison of the telepathic and the spiritistic explanation, the latter of which he prefers. His style is hardly suited to forward his purpose of interesting the general public, while for those who are acquainted with the primary evidence the most noticeable feature of the book will probably be a remark in the preface, that "it is high time that investigations of this kind should be endowed, as are many others of less importance." A very true and timely remark, no doubt, if men were reasonable or really desirous of knowing; but does not the curious fact that nowhere has there ever been endowed any research of the organized and sustained character which has elsewhere wrested secrets from reluctant nature, strongly suggest that mankind has never really desired scientific knowledge of their post-mortem fortunes? And there certainly exists a strong prejudice against knowledge, the exact nature of which is well worth examination. Its study might be commended to our psychologists, who themselves share it so extensively that they should be able to pronounce upon it at first hand.

Dr. Elkin's 'Hume' (Macmillan) is a clear and careful study of the relations of the 'Treatise of Human Nature,' Book I., to the 'Inquiry concerning Human Understanding,' which should prove decidedly useful to all who concern themselves with the great but elusive thinker who shares with Plato the distinction that pedants of all ages have never been able either to fathom him or to leave him alone. Dr. Elkin comes to the conclusion that the 'Inquiry' shows no real changes in Hume's philosophy, and improvements only in minor respects (such as the treatment of belief and instinct), while the only omission which can plausibly be ascribed to a change of heart concerns the discussion of the self. But even here we do not know what, if anything, Hume would have put in the place of the view which, in the appendix to the 'Treatise,' he reaffirms even while professing to discard it, and are left uncertain how far his confession of failure is to be taken as sincere. Dr. Elkin, it would seem, both here and elsewhere, inclines to take his author too seriously; he does not allow sufficiently for the impishness of Hume and his genius for innuendo, whereby he insinuates his most deadly and devastating doubts in the disguise of a modest disclaimer of certainty or a frank confession of dissatisfaction. On the other hand, Dr. Elkin has avoided the common pitfall of making Hume out an absolute skeptic, though he might have laid even more stress than he does (pp. 131, 134) on the aspect of Hume which redeems his theoretic skepticism, viz., his recognition of action as the great source of certainty. It is this side of Hume which has been most neglected in the past, but is most likely to come to the fore in the future, because it makes him one of the forerunners of modern "pragmatism." Not that it will be possible to interpret Hume into a pragmatist any more than to reduce pragmatists to Humians: his delight in playing the *enfant terrible* was too great, and his contempt for current metaphysics and theology too strong,

to permit him to apply to them the practical test of truth he admitted into "politics and natural philosophy." And so his philosophy will always remain a psychological puzzle of the highest order.

The Royal Library of Berlin is to be rebuilt. The scaffolding is already up, and the structure is to be one of the most imposing in the city. New rules and regulations are to be in force; indeed, they will be introduced in the old building pending the completion of the new. The University professors are up in arms against these rules, and no wonder, for they greatly restrict their privileges. Heretofore, as Fritz Mauthner remarks in the Berlin *Tageblatt*, these professors have looked on the Library as practically their private property. They have been allowed to take out as many books and keep them as long as they pleased, and they have abused this privilege shamefully. Mommsen was a partial exception. When he was reading up on a subject, he would go to the Library and have mountains of books piled up before him, but would take home only those he really needed for more careful perusal. These, to be sure, he often kept an unreasonable time. Mauthner knew one professor who always felt insulted when asked to return a book he had taken out. He never had fewer than a hundred at a time, and kept some of them longer than two years. Such abuses are to be curbed by the new regulations, which, while still permitting books to be taken out, require their return within three weeks, under penalty of a fine, and without the privilege of renewal. Mauthner sees the comic aspect of the indignation of the professors. They allege that they alone deserve to be considered, because of the importance of their learned researches; he retorts that 99 per cent. of their learned treatises are simply compilations from various other books, and not worth the paper they are printed on.

The arrest of national physical deterioration is the object of a League for Physical Education and Improvement established at a meeting held last month in the Mansion House, London, at the invitation of the Lord Mayor. The movement, which is on strictly non-political and undenominational lines, and is furthered by many prominent persons, including the Lord Chief Justice and the Bishop of Ripon, is to stimulate public interest in the physical condition of the people throughout the kingdom, and to start organizations for physical health and well-being wherever none exist. Territorial branches are to be formed in the various towns and parishes, to see that instruction is furnished in the laws of health, the nurture and care of children, the methods of domestic and personal hygiene and of cooking and housekeeping. Physical exercises and opportunity for open-air games will be provided for both boys and girls. The medical profession is strongly represented among those who favor the purposes of the League.

The responsibilities of citizenship are being realized by Frenchmen, said M. Paul Sabatier in a lecture recently delivered in London, as never before, and a profound change in the national character is being brought about. One indication of it is the institution called "L'Union pour l'action morale," whose moving spirit is M. Paul Desjardins, and whose members are men of the most opposite opinions, priests and anti-clericals, Jews and anti-Semites, believers and free-thinkers, who meet and discuss subjects affecting the public welfare, such as the separation of Church and State, with deep earnestness and perfect courtesy; proof of a mysterious and very powerful sap working in society. After a reference to the Abbé Loisy and the remarkable spectacle of the conscience of all Europe impressed by that simple priest, M. Sabatier gave a short sketch of the work of Deherme, a compositor, who had brought powerfully before the public the necessity for the cooperation of ideas. He concluded with the statement that thought in France at the present time was at once free and profoundly religious.

The first "Lehrauftrag" for journalism in connection with any Continental university has recently been given in Zurich. The editor of the *Post*, of that city, Dr. O. Wettstein, has for three semesters been delivering lectures in this department as privat-docent, and the Government has now officially appointed him a teacher in this branch, more specifically on the history, the law, and the technic of journalism. This "Lehrauftrag," of course, does not yet establish a university chair of journalism, but an associate professorship (*ausserordentliche Professur*) is looked for in the near future.

The International Medical Publication Association, in its recent meeting in Berne, discussed chiefly the author's rights in medical journals. It was declared desirable that a medical savant should not simultaneously publish his researches in different languages, but should issue the authoritative text only in his native tongue and have all other publications of it appear as translations. It was further decided to issue an international bibliography of medical publications. As the American medical press had hitherto not participated in the work of the Association, it was invited to join. The next congress will be held in Lisbon in April, 1906, with the Spanish Minister of Education as chairman.

The Association Littéraire et Artistique Internationale will hold its twenty-seventh convention in the third week in September in Louvain. The chief subjects of discussion will be copyright and the interpretation of the laws in reference to literary products and works of art. Special attention will be paid to the condition of affairs in America in this respect. The Germans in particular are dissatisfied with our copyright law, and in Louvain the *pièce de résistance* is expected to be a paper on the special literary relation between Germany and the United States, by M. U. Osterrieth.

The Government of Saxony is adding its influence to the propaganda for the elimination of foreign words from the business language of Germany. Quite recently an eminent judge, Dr. Foertsch, published in the *Deutsche Juristen-Zeitung* a characteristic discussion of the "Sprache der Juristen, der Gesetze, der Geschäftswelt." This warm plea for purely German instead of foreign words and expressions the Saxon Ministry has sent to all the commercial schools of the kingdom, asking for the cooperation of the teaching corps in the crusade. The circular declares that there are 70,000 foreign terms used by Germans for nearly all of which good native terms may be found; it also cordially commends the Allgemeiner Deutscher Sprachverein, which leads the purist movement in the Empire, and urges the commercial schools to "sharpen the linguistic conscience of the coming generation of business men."

Dr. Arthur L. Frothingham, jr., who is the first American elected a corresponding member of the Société Nationale des Antiquaires de France, an honor recently conferred upon him, has resigned his professorship of ancient history and archæology at Princeton University in order to devote himself wholly to original research and writing. Although his home will continue to be in Princeton, he will spend much of his time abroad studying the monuments, and he has planned a number of books on art and archæology, two or three of which are already in hand. His work during the past year in France and Italy has been warmly appreciated by foreign archæologists, and he has contributed articles to the *Revue Archéologique*, the *Mélanges*, the *Monuments Piot*, and to the publication of the Società dei Cultori di Archeologia Cristiana.

A correspondent writes us: "I have been watching for some notice in the *Nation* of the death of Dr. Washington Matthews. Among American ethnologists he ranked not lower than second. Without the horizon of genius to put him on a par with Bandelier, he had a distinction all his own. In all American history, no other one man has known so intimately much about any aboriginal tribe as Matthews did. His studies of the Navajo are the most exhaustive thing of their sort in all our anthropology. He was an extremely modest man, without the gift of popularity, either in his writings or in his intercourse. Of an extremely sweet and unselfish disposition, and much beloved by those who knew him, there was not a bit in him of self-seeking or pushing to the front. He accepted, with a whimsical patience, but with his eyes open, his latter-day function as the original source from which a hundred "popularizers" built up notoriety for themselves, without credit to him. He was a real martyr—using that abused word without abuse—both to his duty as an army surgeon and his duty as a scientist; and the great mass of accurate and intimate research that he has left to us will always remain among the chiefs of the corner in our scientific edifice. I do not feel easy that such a man should be forgotten in his death by the *Nation*."

—The second and third volumes of Mr. Worthington C. Ford's edition of the 'Journals of the Continental Congress' (Washington: Government Printing-Office) follow hard upon the first, and present in general the same commendable characteristics. The fact that the two volumes carry the record only to the end of 1775 shows how greatly the business of the Congress increased as the organization of colonial resistance developed. The text of Mr. Ford's edition continues to follow the original manuscript of the journals, but important variations in a second manuscript copy from September 5, 1775, which was made the basis of the printed editions, are noted. Comparison with the printed copies shows hardly a page without some change of either fact or phrase. It would doubtless have been a useless labor to note all these variations, but we still think that it would have been

worth while to point out the more important of them. We note a single instance by way of illustration: under date of December 4, 1775 (vol. iii., p. 402), we have the entry, "*Resolved*, That the committee, to whom the accounts and application from the colony of Massachusetts for a sum of money [were referred?], be upon their request discharged from farther service on that account." Mr. Ford adds the footnote, "The reason given was the want of proper vouchers, which prevented action." As the authority for the note, which Mr. Ford does not indicate, is apparently the printed journal (edition of 1777, vol. i., p. 278), that fact would seem to have been worth mentioning. As a whole, however, the editorial work calls only for praise. A useful appendix to volume iii. is John Adams's notes of the debates from September 23, 1775, to October 30. The bibliography is also continued, with promise of a collation of the printed editions.

—While most of the new matter in Mr. Ford's edition is, naturally, of minor importance, a number of the restored entries are of prime significance. We have, for example, numerous resolutions regarding the distribution of troops or the development of plans of defence, such as those of May 25 and 26, 1775, for the defence of the Hudson and the organization of the New York militia. The full text of the letter from the Massachusetts Provincial Congress, asking advice regarding the assumption of civil control of the province and urging Congress to assume control of the troops throughout the colonies, is given, as is the resolution of Congress, June 19, promising indemnification to Charles Lee "for any loss of property which he may sustain by entering into their service." The instructions of June 20 to Washington, as commander-in-chief, and those of June 27 to Schuyler for the defence of Ticonderoga and Crown Point, and, if he thought proper, the invasion of Canada, together with the report of a committee, December 23, on the same subject, are restored. An interesting item is the resolutions of July 28 on saltpetre, which were not entered on the journal, but appeared only in a pamphlet on the manufacture of saltpetre issued by Congress. Other significant restorations or insertions are Jefferson's drafts, with Dickinson's suggested changes, of the declaration of the causes and necessity of taking up arms; Franklin's proposed articles of confederation, July 21, different from the trade propositions submitted by him on the same date, though the two are commonly printed together; trade propositions probably submitted by Richard Henry Lee at the same time as those of Franklin; Jay's report on trade, October 2; instructions, of the same date, to a committee appointed to confer with Washington at Cambridge; resolutions of November 10 appointing two commissioners to investigate the state of public opinion and the military resources of Nova Scotia, and authorizing Washington to seize or destroy supplies, ships of war, etc., in that quarter; a letter of November 29 to the colonial agents in England; instructions, December 15, for the committee which was to sit during the recess of Congress; and a report of December 23 on supplies needed by the army. It is an interesting commentary, also, on the exigencies of the time, that practically all of the numerous resolutions regarding gunpowder were omitted from the published journals.

—We imagine that the names of Hakluyt and Purchas are as much honored in America as they can be in England, for, though with us no learned society has yet taken its name from either of them, their zeal for preserving the records of exploration gives them title to grateful remembrance on the shores of the New World. Not long since James MacLehose & Sons of Glasgow brought out an excellent reprint of Hakluyt's 'Principall Navigations,' and we have recently received from the same publishers two instalments of 'Purchas his Pilgrimes.' The whole work as reprinted will consist of twenty volumes in large type, embellished by many facsimiles. A new and enlarged index will also be a strong feature of the work in its Scottish guise, the old five indexes of the original being replaced by a more detailed and systematic register. A brief introduction prefixed to the first volume confutes the notion that Purchas died in poverty brought on by his too great enthusiasm for the publication of travels. As is well known, he had been preferred to the living of St. Martin's, Ludgate, more than twelve years before the date of his death. Anthony à Wood is responsible for this along with many other legends. "By the publishing of which books," he says, "Purchas brought himself into debt, but died not in prison as some have said, but in his own house (a little while after the king had promised him a deanery)." As a matter of fact, the will which Purchas drew up shortly before his death shows that he had considerable property. The confusion seems to have arisen from a statement which Purchas himself makes regarding certain obligations he was led to undertake through the death of a brother and his fraternal piety in taking under his care four orphan children. But this incident occurred seven years before his will was drawn, and in the meantime his affairs seem to have improved considerably. It is at least pleasant to know that this genuine enthusiast did not die in want, although another myth now goes to join those regarding the indigence in old age of Belisarius and Botticelli. Another fact of some interest relates to the contrast between Purchas's fondness for the literature of exploration and his own sedentary habits. For, as he says, "least Travellers may be greatest writers—even I, which have written so much of Travellers and Travells, never travelled 200 miles from Thaxted in Essex where I was borne."

—The Cambridge University Press, through the Macmillan Co., adds to its contributions to Latin scholarship the first volume of a new edition of Cicero's 'Tusculan Disputations,' a text upon which, as a whole, English-speaking Latinists have had little to offer, the Orelli edition of 1834 and T. K. Arnold's translation of Tischer and Sorof being the only English successors to the work of Davies, whose first edition appeared in 1709. Mr. Thomas W. Dougan, the present editor, has simply elaborated lectures prepared in the course of his duties as professor of Latin in Queen's College, Belfast. Through the discovery of numerous errors, however, in the *apparatus criticus* provided by existing editions, he has been led into an extended examination of the manuscripts, going through no less than thirty in careful detail, and testing some fifty more on the basis of their readings in chosen passages. His edition, therefore, offers substantial help in the constitution of the text, whatever may be one's judgment as to his choice between competitive readings. On Cicero's sources for the work Mr. Dougan is content to set forth in brief the conflicting surmises of former scholars, committing himself to nothing more positive than the statement, for instance, that he finds no evidence that in sections 56-65 (book i.) Cicero may not have derived the basis of his arguments from Posidonius. As is so often the case with English editions of the classics, the commentary is burdened with continual grammatical explanations and aids to translation so elementary in character as to be utterly out of keeping with the supposed purpose of the book. Does any student far enough advanced to have even a faint comprehension of the deeper problems considered need to have an explanation of the ablative in the phrases *multis post annis* and *egressus Porta Capena*, or to be told that *etiam maiora molior* means "I am aiming at greater things"? It should be assumed that one who cares to pay several dollars for a Cambridge or Oxford edition of an ancient classic has already acquired some ability to deal with the simpler questions of its form and meaning. Mr. Dougan is right in his estimate of Cicero's natural aptitude for a career in letters rather than in oratory or statesmanship, but to speak seriously of his youthful "Aratea" as a model of style for the great poem of Lucretius is to go far beyond what is warranted by the nature and number of the similarities which have been pointed out.

—The beginning of the end of the great 'Catalogo Generale' of Italian publications, 1847-1899 (Milan: Hoepli; New York: Lemcke & Buechner), is now clearly in sight with parts 30 and 31 which break off with U. As respects Italian authors, we observe that Tasso, filling three and a half columns, is a live classic; and the patriotic Tommaseo covers well and voluminously each part of the period embraced in this Catalogue. Among foreigners, neither Turgeneff nor Tolstoy figures as largely as might have been expected. Tolstoy's 'War and Peace' was not translated till 1891, but his later productions have been followed up. Thiers's 'Consulate' was retranslated in 1888-91. Eugène Sue has kept on the scene ever since 1847, and his 'Mysteries of Paris' found an issue in 1891, his 'Wandering Jew' in 1895. Of Taine, on the other hand, nothing has been taken over but two fragments from his 'Notes on England.' Swinburne has been neglected save for his lines to Landor and those on Siena. Herbert Spencer could not complain of his treatment. The explorer Stanley found favor in the peninsula. A tenth edition of Gulliver appeared in 1898; there have been four editions of Sterne's 'Sentimental Journey.' R. L. Stevenson has been a sealed author to the Italians apart from 'Treasure Island.' Sudermann is much in vogue; Sybel has not been in evidence since 1874. Even Swedenborg is returned to in 1890. "Timothy Titcomb," whose pseudonym is not suspected by the editor, succeeds in placing one work, his 'Letters to Young People,' but no more; and that choice was made in 1891. Of classic authors we re-

mark a growing interest in Tacitus. Nearly as many of his titles bear date of the nineties as all that preceded in four decades; and the nineties show twice as many as the eighties.

—One of the least clearly understood productions of Goethe's early career—and not a few of these are somewhat obscure—are the fragments of his 'Wandering Jew.' Not only is it difficult to determine what the underlying conception of Goethe's treatment of this legend was—if, indeed, there was any such fundamental conception—but the individual fragments themselves offer many puzzling problems of interpretation and arrangement. No commentator thus far has done so much to shed light upon these problems as Prof. Jacob Minor in his recent book, 'Goethe's Fragmente vom ewigen Juden und vom wiederkehrenden Heiland' (Stuttgart: Cotta), which may well be called a model of searching literary analysis. Indeed, this book is much more than a commentary on Goethe's poem; it is an important contribution to the intellectual history of the eighteenth century. Professor Minor makes it abundantly evident that Goethe, in selecting this legend as a thread upon which to string his observations on the religious and ecclesiastical conditions of his time, fell in with a long and widespread literary tradition. Not only Ahasuerus and the Saviour revisiting the earth were in the eighteenth century frequently made witnesses and critics of the affairs of modern Christendom, but there existed, in Spain, France, England, and Denmark, no less than in Germany, a large popular literature of theological satire in the form of fictitious travels and adventures. A careful analysis of these religious novels, such as the anonymous 'Die Peripatetiker des 18. Jahrhunderts,' the 'Menoza,' by the Danish pastor Pontoppidan; 'The Spiritual Quixote,' by Graves; 'Sophien's Reise von Memel nach Sachsen,' Nicolai's 'Sebaldus Nothanker,' and others, and a comparison of these with the theological satire of Goethe's poem, form the most conspicuous part of Professor Minor's work, and demonstrate beyond doubt that every one of the points on which Goethe's satire lingers, belonged to the most widely and eagerly discussed religious topics of the time. It is a pity that the question as to the way in which Goethe was to bring artistic unity into this mass of miscellaneous satire, and particularly as to the way in which the two central characters of the story, Ahasuerus and the Saviour, were to be brought face to face with each other, must largely be left to conjecture.

WUNDT'S PRINCIPLES OF PHYSIOLOGICAL PSYCHOLOGY.

Principles of Physiological Psychology. By Wilhelm Wundt. Translated from the Fifth German Edition (1902) by Edward Bradford Titchener. Vol. I. The Macmillan Co. 1904.

When, in 1862, two years after Fechner's 'Psychophysik,' Wundt emerged from the physiological laboratory with his 'Beiträge zur Theorie der Sinneswahrnehmung,' students in this country there were who saw in the little volume the harbinger of a new science of experimental psychology; and the next year their hopes seemed to be crowned in the same author's 'Vorlesungen über die Menschen- und Thierseele,' concerning which, by the way, it had better be noted that, like other of Wundt's books, it has lost most of its original flavor in a second, reconsidered edition, and that the English translation represents this later edition. Without this explanation, the sensation it first caused would be incomprehensible. Its readers heard in it the promise that the new science should keep pace with the other strictly experimental sciences, and should quickly outstrip all those sciences (more numerous then than now) in which experimentation had not become practicable. Alas, to-day we are forty years wiser, and a chilling shade settles on hearts of enthusiasts of the sixties who now compare the advance that psychology has achieved—indisputable, but how modest!—with the unheard-of leaps that every other science has performed, be it an experimental one or not. Since 1860 the foundations of pure mathematics have been reconstructed; exact logic has been developed; physics has gained an optico-electrical theory, and radically new conceptions of molecular forces have been established; organic chemistry has followed out the doctrine of the aromatic compounds, and has been enriched by the doctrine of the unsymmetrical carbon atom; in its inorganic division the classification of the elements has been laid bare, the group of helium-argon elements has been added, and Mme. Curie has pronounced her magical "Open, sesame!" Besides all that, a new and more scientific kind of chemistry has been opened up. Biology has been equally revolutionized; astronomy has its new astrophysics, and geognosy has kept pace with the other sciences. Even on the psychical wing, linguistics, ethnology, archæology, the history of high antiquity, have all found and matured new methods. In short, there is not a science that has not left psychology lingering in the rear; and the burning question of to-day is, why this should be so? Who will diagnose the malady of psychology?

It has been remarked that, at present, there is nothing which for the psychical wing of science fulfils that function which the science of dynamics fulfils on the physical side. Everybody knows what that function is. Every attempt to explain any phenomenon physically consists in first proposing some hypothesis as to the existence of designated dynamical conditions from which, according to the principles of dynamics, phenomena such as have been observed would take place, and then going on to put the hypothesis to the test of making it the basis of predictions concerning untried experiments.

Now it is a circumstance most significant for the logic of science, that this science of dynamics, upon which all the physical sciences repose, when defined in the strict way in which its founders understood it, and not as embracing the law of the conservation of energy, neither is nor ever was one of the special sciences that aim at the discovery of novel phenomena, but merely consists in the analysis of truths which universal experience has compelled every man of us to acknowledge. Thus, the proof by Archimedes of the principle of the lever, upon which Lagrange substantially bases the whole statical branch of the science, consists in showing that that principle is virtually assumed in our ordinary conception of two bodies of equal weight. Such universal experiences may not be true to microscopical exactitude, but that they are true in the main is assumed by everybody who devises an experiment, and is therefore more certain than any result of a laboratory experiment.

The sort of science that is founded upon the common experience of all men was recognized by Jeremy Bentham under the name of *cenoscopy*, in opposition to *idioscopy*, which discovers new phenomena. But long before Bentham's day the situation was sufficiently understood to set up a movement in the more enlightened countries to supply the psychical sciences with an analogous analytical foundation. The innumerable grades in the distinctness of thought prevent us from assigning dates, but one may say that the idea is struggling to the light in Locke's 'Essay' of 1689, and that its development was the best fruit of the eighteenth century. It moved in Italy, in France, and especially in Scotland. The analytical economics of Adam Smith and of Ricardo were examples of it. The whole doctrine in its totality is properly termed the Philosophy of Common Sense, of which analytical mechanics and analytical economics are branches. That Pragmatism of which so much has been said of late years is only an endeavor to give the philosophy of common sense a more exact development, especially by emphasizing the point that there is no intellectual value in mere feeling *per se*, but that the whole function of thinking consists in the regulation of conduct. All this it is most needful to comprehend in order to assign to Wundt his proper rating in the history of philosophy.

The 'Physiological Psychology' is Wundt's most imposing and monumental work, but no man of science will call it his *chef-d'œuvre*. That rank can be accorded to one production alone, his 'Untersuchungen zur Mechanik der Nerven und Nervencentren,' of which the first part appeared in 1871; the second, which is less fundamental, but perhaps not less important, having been delayed by accidental causes until 1876, after the first edition of the 'Physiological Psychology' had appeared. Four traits of the 'Mechanik der Nerven' command admiration. One of them is a natural gift; two are results of scientific training; and one is a moral virtue. The gift is an astonishing sagacity about nerve-physiology—a subterconscious susceptibility to the noeto-meteorological premonitions of a hail-storm of evidence that, when it bursts, will be cold, hard, and cutting enough.

Of the two scientific perfections the more striking is the mature prestudy of the methods that were or might have been pursued in the investigation. The other is the vigilant scrutiny of all details of the phenomena, especially of such as, being unlooked for, might easily have been overlooked. But the most admirable trait of all—that self-respecting quality of Wundt's which no foibles can obscure—is his genuine anxiety to correct the opinions which he at the time entertains, and to cast away his most brilliant theories the instant the dicta of experience seem to be against them—a quality in which he so contrasts with all the metaphysical charlatans and self-admirers and with every other quintessential extract of littleness. Wundt's great service to man, aside from that special research described

in the 'Mechanik der Nerven,' has consisted in teaching the students of cenoscopy the beauty of those virtues upon which the students of idioscopy, especially those on the physical wing, have always insisted —virtues that will necessarily result from any well-considered desire to know the truth. That such service has been Wundt's undoubtedly remains true, notwithstanding some lapses.

But the work of which Professor Tichener is publishing his translation is not to be classed as a performance of idioscopy, and little given is idioscopy to expressing itself in big books. It is not a work of heuretic science of any kind. It is a product of that useful industry of collecting, arranging, and digesting the deductions of mathematics, the analyses of cenoscopy, and the discoveries of idioscopy—a service of which the Germans have assumed the burden, and which, as being the "systematization of knowledge," they as well as the general public are too apt to mistake for the business of science. From the date of the publication of this work, Wundt has turned a corner in his career, and has pursued a course not determined by the intrinsic affinities of his previous work. His principal publications (aside from revisions and from papers in his periodical *Philosophische Studien*) have consisted in an extensive treatise on logic, another on ethics, and a 'System der Philosophie.' These are subjects to which the majority of their devotees have been led by a desire to settle their beliefs about God, freedom, and immortality. But students of science are a good deal given to thinking that high theory is more apt to lead men wrong than right about religion, while religion has never done theory more good than harm. The doubts which impelled the few men of science who have been led to any thorough study of philosophy have almost always been concerned with the limits of trustworthiness of scientific results. But Wundt has never entertained any such general doubts. He explicitly says that whatever is not based upon the results of the special sciences has no real basis at all. He makes no exception in favor of dynamics, on the truth of which all his own work reposes. But, for him, common sense is nothing but an imperfect kind of science; and it is remarkable that his physiology recognizes no very fundamental difference between the functions of the cerebral cortex and those of the organs at the base of the brain. To the question what could have been Wundt's motive in putting himself forward as a leader in philosophy, for which he had never displayed any genius, but rather the reverse, the answer to which the study of his writings must lead is that the results of experimental psychology, meagre though they be as compared with those of other sciences, so dazzled the imagination of Wundt as to make him think that that study alone must be set up as the queen of the sciences, and prompted him to try to prove that logic, ethics, and philosophy could be securely based on that special science.

Wundt's philosophical publications have not met the acclamations that he undoubtedly at first expected; nor can it be said that the two scientific merits above mentioned are here one whit better exemplified than in the general run of second-rate philosophical treatises of the time. They rather fall below that average. In the matter of the deliberate preselection of methods, for example, one will not often meet with anything weaker than Wundt's admission that it seems self-evident that metaphysics should not be made to depend on the results of special science, while defending himself by saying that, having come to philosophy from physical science by the route of experimental psychology, it is natural that he should be unable to pursue philosophical investigations by any other method than that which his own sequence of study suggested to him. ("Ship ahoy!—Where are you bound?" "For the port of Philosophy." "Then why, in Heaven's name, are you sailing on that course, Captain Wundt?" "Well, the truth is, this is the way the vessel was heading at the time it occurred to me to make that port.") Other equally gross departures from the two scientific ideals could easily be pointed out. Whether or not, if Wundt had possessed any analytical strength, it would have been possible for him to imagine that he could base such matters as dynamics, geometry, and arithmetic upon his physiological experiments, or whether in that case he could have failed to perceive the value of the pragmatist analysis in binding together nerve-physiology and psychology, must remain matters of opinion. But, unfortunately for his good fame, there exist departments of logic upon which he has touched that no more fall within the marches of opinion than does the principle of the lever or the doctrine of limits; and here he simply places himself where Hobbes placed himself by his attempts at reasoning on exact subjects; and those who, nevertheless, talk of Hobbes as a "great logician" will be free to entertain the same opinion of Wundt—and of Lord Timothy Dexter.

As for the 'Ethics' and the 'System of Philosophy,' we shall simply say that no person of discrimination would prove that quality by ranking them among works of the first order. We say no more, because such deviations from a great career are too unpleasant to contemplate. Of course, even in the 'Logic' there are brilliant chapters; it could not be otherwise, their author having achieved such things as he had, though in a distant field. As to the 'Physiological Psychology,' there will probably be no break in the unanimity that it is the most important monument of the new experimental psychology. Professor Titchener's translation has been eagerly awaited for long years. He explains the delay in his preface. It appears that he has made three complete translations of the work which have twice been superseded by revisions of the original. He is himself of opinion that his third is the least good of the three, but one does not see how that could possibly be. His unusual skill in making agreeable English of a faithful rendering from disagreeable German had already been proved—a psychological accomplishment which Oxford training, the experience of the psychological laboratory, and practice in this very thing have perfected. It is not comprised in the verbal expression. Unerring judgment has been exercised in the editing both of the present volume and of others. The author's slips, if not too numerous, have to be corrected, with or without mention, according to circumstances. Whether the lettering of diagrams shall continue to represent German words or not, whether or not bad figures shall be replaced by better ones, etc., are questions about which the least talent for judging wrong would have betrayed itself if it had lurked in the translator. The present volume, the first of three, includes only the first and perhaps the most interesting of the six divisions of the original work. It relates to the subject in which Wundt's opinions have the greatest weight; and it is a subject whose practical corollaries will be obvious to every reader—"the bodily substrate of the mental life."

CUTLER'S LYNCH LAW.

Lynch-Law: An Investigation into the History of Lynching in the United States. By James Elbert Cutler, Ph.D. Longmans, Green & Co. 1905.

As we write, the morning paper reports, among other minor happenings, that a mob last night broke into a Georgia jail, lynched a white man and three negroes accused of murder (their guilt at least doubtful), and three other negroes, apparently on general principles. As usual, the sheriff refused to give up the keys until he was told that it would be expected; presumably, as usual, the mob included "some of our best citizens."

This episode once for all decisively disposes of several of the most familiar assertions with regard to lynching. First, a white man was killed as well as negroes—lynching was not, therefore, a penalty become necessary in order to maintain race supremacy; the charge made was that of murder, and had nothing to do with violence to women; the mob hung men who appear to have been guilty or suspected of minor offences, so that it has not a kind of last appeal in protection of life; there is no evidence that there would have been any trouble in securing a proper trial and conviction of all the criminals by the regular process of the courts. The affair was simply a variant of the English sportsman's inspiration, "What a beautiful day! Let's go out and kill something."

Inferences from a single case prove little, but the careful study of Dr. Cutler not only confirms such obvious generalizations, but for the first time furnishes a body of authentic material from which to draw more far-reaching and important deductions. In his preface, Dr. Cutler acknowledges his indebtedness to the generosity of Mr. Albert Matthews, whose researches into the origins and early instances of this practice are well known to readers of the *Nation*. It is not every scholar who for years has made such a subject his special interest, yet will cheerfully put his material at the disposal of a later writer. That early material has been supplemented by Dr. Cutler's own researches, and he has worked out for himself the question of lynching in the half-century before the civil war, and also the awful growth and spread of the practice during the past forty years. Dr. Cutler devotes an interesting chapter to the origin of the term lynch-law, and comes to the conclusion that "at some time between 1780 and 1817 the term Lynch's law became a localism in Virginia in the region of the James River. By the year 1819 it had

spread as far West as Indiana, and by 1828 it had become still more widely used, but had not superseded all other terms for the popular administration of justice." He is convinced that the name is derived from Col. Charles Lynch, sometimes also called Judge Lynch, who set up a summary tribunal for the trial and whipping of Tories during the Revolution. The practice itself is traced by Dr. Cutler back to the middle of the eighteenth century. He has, however, left untouched a field of inquiry which may prove profitable, namely, the Spanish methods of offhand execution; it is well known that the Spanish Hermandad in the fifteenth century seized, whipped, and executed malefactors right and left. Indeed, they had a regular system of binding the criminal to a post ("which shall in no wise have the form of a cross"), when the archers were to "use his body for a target, and shoot arrows into his body until life shall naturally become extinct." Is there here some distant prefiguring of the chivalrous practice of riddling a dead body with balls which is so frequent an accompaniment of orthodox lynchings?

The next stage of Dr. Cutler's investigation relates to lynch law from about 1750 to about 1830; and he shows that lynching usually went no further than whipping, or whipping and banishment. In this discussion a few references are made to the punishment of negroes; to that list might be added the dreadful instance related by Hector St. John Crèvecœur, of the negro exposed in a wooden cage, his eyes picked out by birds, for the crime of killing his master. In the chapter on lynch law from 1830 to 1860, Dr. Cutler successfully dispels the conventional statement that there were neither rapes nor lynchings in slavery times, which Page, in his 'The Negro, the Southerner's Problem,' thus expresses: "No one will deny that the crime of rape was substantially unknown during the period of slavery, and was hardly known during the first years of freedom: it is the fatal product of new conditions." Dr. Cutler has discovered, between 1830 and 1840, six cases of this crime by negroes against white women, in all of which the criminals were duly tried and executed; from 1850 to 1860 five were executed for the crime, and twelve were lynched, of whom four were burned at the stake. He shows further that in 46 cases of negroes who had killed owners or overseers, 26 were executed, of whom eight were burned at the stake, and that there were also numerous lynchings of white men. Professor Burgess says that only one abolitionist lost his life on account of his doctrine, but Dr. Cutler has collected numerous instances of whippings and hangings or shootings of abolitionists by Southern mobs. Another important line of evidence goes to show how lynchings in this period extended upon the Western frontier and into California. The reviewer has before him a tabulation showing, between 1823 and 1860, 56 indubitable cases of lynchings of negroes and white men, and the list could undoubtedly be much increased from the files of Southern newspapers.

Another delusion with regard to lynching is that it sprang up on account of the lawlessness of negroes in Reconstruction times. Mr. Page is convinced that violence to women "is due to two things: first, to racial antagonism and to the talk of social equality that inflames the ignorant negro, who has grown up unregulated and undisciplined; and, secondly, to the absence of a strong restraining public opinion among the negroes of any class." What are the facts as shown by Dr. Cutler's laborious researches? That by the summer of 1867 the Ku-klux Klan was transformed into a body of regulators, which continued after the dissolution of the Klan in March, 1869; that the lynchings in that period averaged about fourteen a year, were distributed throughout the Union, and that more white men were lynched than negroes. The undoubted increase in the use of this method of dealing with criminals is therefore demonstrably not dependent especially upon the crimes of negroes, and still less upon the most serious crime which they could commit. Indeed, it was not until 1882 that the number of instances attracted such attention that newspapers began to tabulate them; and the terrible truth is, that there is an authentic record of 3,337 persons lynched in the twenty-two years from 1882 to 1903, or an average of 150 a year, the largest number being 235 in 1892 and the smallest 97 in 1902. Dr. Cutler has taken great pains to analyze the reasons for the lynchings, and in interesting tables has worked out the relation of lynchings to the months of the year, to color, to sex, etc.; and he is able to show that the total number of lynchings for rape (about seven hundred) is only one-third of the total number of lynchings of negroes; that about seventy white men were lynched for the same offence in the South; that not till about 1890 did the number of negroes lynched exceed the number of whites lynched; that 40 colored and 23 white women were lynched; that among the minor offences for which human beings were deprived of their lives by a raging mob were swindling, elopement, jilting a girl, colonizing negroes, throwing stones, making threats, slapping a child, refusing to give evidence, giving evidence, and bad reputation. He shows further that the circumstances of these acts of mob violence have grown more and more revolting, till they have reached the point of the deliberate and wilful murder, with the most horrid tortures, of a negro woman, whose sole crime was that she was the wife of a man charged with rape and tried to escape with him. And after carefully considering the alleged justifications and defences of the system, Dr. Cutler concludes that "the lynching of negroes in recent years can be justified on no other ground than that the law, as formulated and administered, has proved inadequate to deal with the situation—that there has been governmental inefficiency"; and, still more cogently, that, "in the last analysis, lynch law in this country is without any justification whatsoever." He characterizes the excuse urged for lynching in a very significant phrase, in itself an argument: "Let past crime be met with present crime in order that future crime may be prevented."

The last chapter of the book deals carefully with the question of remedies, and some remedy must be found or the practice will make still farther inroads into the West and North, where the systematic and sometimes hired assaults upon non-union laborers are closely akin, in spirit and effect, to the worst lynchings. Mr. Page, in his book on the negro, is sure that most of the lynching would be stopped if the negro reprobated rape; he overlooks the fact that the same crime is not prevented by any degree of public sentiment acting on white men North or South; and it is evident from Dr. Cutler's researches that lynchings would go on, and will go on, irrespective of that particular crime. Apparently, the first remedy necessary is more backbone on the part of prison officials; if the mob knew that the only way to get a prisoner was to kill the sheriff, and, still more, if they knew that he would sell his life dearly, three lynchings out of four would stop before they began. Nothing has done so much to shock the country and to convince it that the whole community (at least in Georgia) sanctions lynchings, as the criminal behavior of the militia who stood by and let prisoners be lynched under their noses at Statesboro, and this in a State which for more than ten years has had a law making it a penitentiary offence to lynch any citizen "without due process of law." Dr. Cutler analyzes the legislation of several States upon this subject, and points out the sorrowful fact that such laws appear to have little or no effect upon the lynching spirit, and that it seems almost impossible to obtain the conviction of a lyncher in any State. In fact, within a few months, a brutal whipping of a man and woman in Marion, Massachusetts, led to prosecutions in which the jury obstinately refused to convict.

Another suggestion, which Dr. Cutler ascribes to Justice Brewer, is that the right of appeal in criminal cases be taken away; this is closely akin to a remedy which as Dr. Cutler shows was actually practised in slavery times, namely, the establishment of extra-judicial tribunals for the summary investigation and punishment of crimes of peculiar atrocity. Such tribunals, composed of men of standing, would go as far as any machinery toward ascertaining the facts, and would remove the excuse, which Dr. Cutler proves to be ill-founded, that without lynching the criminal would escape altogether. Dr. Cutler's panacea is the slow rise of a more intelligent and humane public sentiment; as the negro becomes more valuable industrially, there will be less inducement to extinguish members of his race, and officers of the law will do their duty better. It seems a tedious waiting. Dr. Cutler has done much to solve the problem by his laborious, careful, and candid study of the question, which has already made him the leading authority upon a dangerous social disease.

De Profundis. By Oscar Wilde. G. P. Putnam's Sons. 1905.

It has happened more than once that a literary life has been cut in two by some great event or great misfortune—a reversal of all the man's interest and hopes. Such a reversal is likely to bring with it, as in a Greek tragedy, a sharp recognition of a side of life that had been ignored before, and with that a recognition of the man's self. But for few men can the change without and within have been so complete as for Oscar Wilde. Before his trial and imprisonment, he was a man interested almost wholly with the decorative side of life. He could write a good comedy, as was proved by 'Lady Windermere's Fan,' and a poor novel (since a novel that is an allegory is bound to be poor), as was proved by 'Dorian Gray.' His essays, 'Intentions,' glit-

tered with epigrams and may safely be called brilliant, since that epithet implies that they might have been really good if the ideas had been as likely to wear as the style. As for the famous epigrams and paradoxes, Mr. Shaw has since demonstrated what can be done in the same line by a playwright whose philosophy is not merely that of an æsthete.

Whatever one may think of Oscar Wilde's prose (and a style such as his will always disarm the critic), we are quite sure that no one who cares about Greek literature will ever manage to read his poems through. A subjective treatment of the Greek myths by a modern poet is bound to disgust any one who knows how they were handled by the poets of Greece. Of course it can be tolerated here and there, but it must be extremely well done. No one resents Wordsworth's longing to live in closer harmony with nature, to be—

"A Pagan suckled in a creed outworn,
So might I, standing on this pleasant lea,
Have glimpses that would make me less forlorn;
Have sight of Proteus rising from the sea,
Or hear old Triton blow his wreathèd horn."

But who would have respected Wordsworth as a man or a poet if all, or nearly all, his poetry had sounded this note? No poet, if he wishes his poetry to seem sincere, should forever be telling us that he was born too late, that the Spirit of Beauty has vanished from the vulgarized earth, that personally he would have been more at home with Dryads and the "Huntress Dian" and Helen of Troy.

"Spirit of Beauty, tarry yet awhile,
They are not dead, thine ancient votaries.
Some few there are to whom thy radiant smile
Is better than a thousand victories.
. . . There are a few
Who for thy sake would give their manlihood
And consecrate their being. I, at least,
Have done so, made thy lips my daily food,
And in thy temples found a goodlier feast
Than this starved age can give me."

So sang this London æsthete, whose favorite walk was Piccadilly, and his home a house in Chelsea filled with bric-à-brac. "Eh bien!" exclaims Nordau, "une promenade avec un soleil à la main est-elle aussi inspirée par le besoin de beauté?" Oscar Wilde was not the first nor will he be the last to flatter himself that the naturally Pagan soul is starved by the Philistinism of modern life whereas it would have been perfectly at home in violet-crowned Athens. The illusion might be forgiven one who really believed that the Greeks persistently wore fresh flowers, dreamed only of beauty, and were wholly unmoral. The Greeks of whom we know anything, who were not pure fictions of the poets, were, for the most part, serious, sad, hard-working men. No race was ever more appreciative of art; but, after all, they thought that the highest compliment they could pay to a poet was to elect him a general. No poetry was ever more didactic than theirs. Would any one of them have agreed with Oscar Wilde that a sense of color is more important for the development of the individual than a sense of justice? What would Sophocles, who "saw life whole," or Euripides, or Menander with his care-lined face, have made of a late-Victorian æsthete? Athens, too, even in her best days, had her degenerates, but she was not proud of them, and did not encourage them to become conspicuous. As for the Anacreontic temperament, which is quite another story, it was as rare in Greece, we may be sure, as the temperament of Tom Moore in our own age. The truth is that when a modern poet sighs for Pagan surroundings, and Helen, and the Spirit of Beauty, what he really craves is not the "ringing plains of windy Troy," nor yet the busy streets of Athens, but the land of the lotus-eaters and the Islands of the Blest—places that never existed. Oscar Wilde's poems are often pretty enough, with their endless lists of flowers, their river-gods, and brown-limbed shepherds and fisher boys, and the inevitable sorrows of Philomela. But purely imitative poetry never lives long even when the poets imitated are Greek, and Oscar Wilde had not the genius to make the echoes his own, or originality enough even to refrain from reflecting the Victorian poets, when he did not reflect the Greek.

So much for the writings of Oscar Wilde before his imprisonment. So far he had appealed to no emotions save the æsthetic, and had been accepted as the apostle of a certain sort of culture. To the last he had an exaggerated idea of the position that he had secured.

"I was a man," he says in 'De Profundis,' "who stood in symbolic relations to the art and culture of my age. I had realized this for myself at the very dawn of my manhood, and had forced my age to realize it afterwards. Few men hold such a position in their own lifetime, and have it so acknowledged. . . . With me it was different. I felt it myself, and made others feel it. Byron was a symbolic figure, but his relations were to the passion of his age and its weariness of passion. Mine were to something more noble, more permanent, of more vital issue, of larger scope."

This exaggeration of the rôle that art plays in life, this megalomania with regard to the rôle one has filled one's self, is, however, one of the few expressions in the 'De Profundis' that the reader would wish away. But it is written with perfect sincerity. To the last, Oscar Wilde was a *cultivateur du moi*, incapable of an objective point of view; but surely if a man may be forgiven egotism at all, it would be in such a work as this. Nothing is more pathetic than the egotism of 'De Profundis.' Its writer hoped that when, after two years' imprisonment, he should be free to work again, he would be able to recreate his "creative faculty," and assert himself as an artist: "If I can produce only one beautiful work of art, I shall be able to rob malice of its venom . . . and to pluck out the tongue of scorn by the roots." As far as we know, he lived to write only the "Ballad of Reading Gaol" and the 'De Profundis,' neither of them a great work of art, and both inspired by his captivity.

"I know not whether Laws be right,
Or whether Laws be wrong;
All that we know who lie in gaol
Is that the wall is strong;
And that each day is like a year,
A year whose days are long.
. . . . . .
Ah, happy they whose hearts can break
And peace of pardon win.
How else may man make straight his plan
And cleanse his soul from sin?
How else but through a broken heart
May Lord Christ enter in?"

These verses from the "Ballad of Reading Gaol" are the keynote of the 'De Profundis.' After the first months of rebellion and resentment, it seemed to the prisoner that he had been born into a New Life, since he had learned to eat his bread with tears. "To have become a deeper man is the privilege of those who have suffered. And such I think I have become. . . . I have a right to share in sorrow, and he who can look at the loveliness of the world and share its sorrow, and realize something of the wonder of both, is in immediate contact with divine things, and has got as near to God's secret as any one can get." Thus it was that he found in Reading gaol a greater treasure than any of the pleasures that he had to renounce, the treasure of humility. Before his punishment he had walked on the sunny side of life, cared only to look into the shallows, and, like the sunflower which for a brief period was the badge of his foolish followers, had declined to turn his face towards the shadow. That is the chief reason why all that he wrote has the air of something desperately incomplete, the tediousness that always lies in wait for the work of a *poseur*. Such a man as he had been, might have come out of gaol with the airs of a fallen Titan or put on the armor of flippancy and followed his old bent like Casanova. He would then have remained the most unpleasing figure in the literary history of our times. What he accepted in the end was not the judgment of men, for his individualism was never shaken; but he faced his own ignorance, learned through suffering, and proved the truth of Plato's contention that punishment may cure the soul of evil. That contention could never be true of the mere sensualist. Written from the depths, this last confession (for it is a confession rather than an apologia) is one of the most painful and touching, as it is one of the most sincere, of all self-revelations, and will go far towards setting Oscar Wilde's memory right with the world for which he affected to care so little.

Die Interpolationen in der Odyssee: Eine Untersuchung. Von Friedrich Blass. Halle, 1904. Pp. 306.

The question as to the composition of the Homeric poems seems no nearer a settlement now than half a century ago. Wolf, in 1795, thought that he had shown by external evidence that the Iliad and Odyssey owed their unity of composition, as works of art, to a commission of poets appointed by the Athenian monarch Pisistratus, in the sixth century B. C. Then, following internal indications, Lachmann, in 1837, divided the Iliad into sixteen independent lays. Third, Kirchhoff, in 1869, was believed to show how the Odyssey grew, by gradual accretions, from an original poem of 1,200 lines to one of more than 12,000 verses. For many years the defenders of the essential and original unity of the poems were hardly allowed the right to an opinion on the subject. The beauty of the poems was declared to lie in the independent lays, not in their composition as great wholes, in spite of the authority of Aristotle, who declared the Iliad and the Odyssey to have poetic unity in a far higher sense than any of the other Greek epics which we have lost. But now one of the most learned scholars and incisive critics of Germany appears with an able and very readable book to prove that if about one-sixth of the Odyssey is removed, as added by later and less skilful workmen, a poem remains which is not only charming in its brief narrations, but also of extraordinary beauty and ingenuity in its plan.

Blass is no *Doctorand*, seeking a reputation by a paradoxical thesis; on the contrary, he is one of the sanest Greek scholars of the world, who has shown himself master of an unusually wide field of learning. He has edited most of the works of the Greek orators with great skill, and his editions of the recently discovered 'Constitution of Athens' and poems of Bacchylides have had a wider sale than any others. His revision of the first two volumes of Kühner's voluminous Greek Grammar and his own Grammar of New Testament Greek have shown his familiarity with grammatical problems. He has written important treatises on palæography, epigraphy, hermeneutics, and the pronunciation of Greek —indeed, his work on the last subject stands alone in its field, for learning and sound judgment. For the study of the Greek Testament he has provided more help and stimulus than any philologist before him since Lachmann, who died more than half a century ago, editing the Acts of the Apostles with a philological commentary, and three of the gospels with critical apparatus. In his edition of the Acts he showed conservatism, it is true, in composing for this a Latin commentary, and in advocating the Lucan authorship of the whole.

The existence of a great poem seems to Blass to be good ground for the inference of a great poet. We may as well believe, he thinks, in the existence of a many-headed hydra as in many poets of genius working together in the composition of the Iliad and the Odyssey—of which poems the action covers only two periods of six or seven weeks—while all the rest of the broad field of epic poetry was cultivated by poets of so much less genius, grace, and power that their works have disappeared. We must accept Aristotle's judgment as to the lack of unity in the so-called Cyclic Epics, and also the statement of Proclus that these were read chiefly because of the myths which they contained. Much Greek literature has been lost which we should be glad to have, and fashions in literature obscured the judgment of the ancients as to what was worth preserving; but, on the whole, the sifting process of time saved for us what was best in Greek literature, and we need not suppose the lost "Little Iliad" to have been the equal of our Iliad. Theocritus stands higher as an artist since the tombs of Egypt yielded a papyrus copy of Herondas for comparison with him, and the flight of the "Theban eagle" seems more glorious since scholars have recovered some of the poems of Bacchylides and Timotheus. The story of the redaction of the Iliad and Odyssey by the commission of Pisistratus, Blass characterizes as absurd. The worth of tradition as opposed to conjecture has recently come to honor, and he declares it high time to apply to the criticism of Homer the principles which are followed in the treatment of other authors. We have no more *à priori* right to pull to pieces the Homeric poems than those of Horace and Juvenal. The impossibility of reconciling the chronology of the Odyssey, in the length of the visits of Odysseus and Telemachus, is freely recognized; but this chronological confusion is perceived only by one who takes pencil and paper and makes a calculation, which no one of the bard's hearers would have done. It is not half so obvious as the disregard of the element of time in some Attic tragedies. The logical consistency required by a hearer is not the same as that demanded by a reader who possesses a verbal concordance and can turn forwards and back in order to examine the perfection of junctures. In the "Œdipus at Colonus" of Sophocles, Theseus is clearly the ruler of Athens, but who is at the head of the Government in Thebes, whether Eteocles or Creon, is uncertain. Similarly, in the "Antigone," Creon appears at one time as a new ruler, but at another as having been long in power. Blass declares the unity of composition of the Odyssey to be more perfect than that of any other work of Greek literature of like extent. If we are to say that any inequalities in the composition of the 'Republic' of Plato are to be explained by the fact that the author was engaged in this work for many years, and did not write it with one impulse, why cannot the like be said of the author of the Iliad? Why should a stricter unity be required of the Odyssey than of Goethe's "Faust" and 'Wilhelm Meister'? If Goethe is right in his principles, then we should not make such criticisms on the Iliad and Odyssey; and if Aristotle is right, then we may adopt his view of the unity of the Homeric poems. No reasonable objection can be raised to the theory of the composition of such poems in the early ages of Greece, now that archæological excavations have brought to light the evidence of the existence of such magnificence of architecture in Greek lands in still earlier ages—palaces in which these poems might fitly have been sung. In later times, in the age of free states, when the whole community formed the audience, the people could come together only on festival occasions, and only parts of the poems could be recited at once. That the uncle of Herodotus, Panyassis, at the beginning of the fifth century B. C., is said to have composed a "Heraclea" of 9,000 verses, is not unreasonable, if we suppose that in his time at Halicarnassus the Carian court was much like the Ionian courts of the ninth century B. C.

In the Homeric poems, Blass does not follow Gottfried Hermann in recognizing pre-Homeric, Homeric, and post-Homeric elements. The work of the Homeric poet he considers incomparably more important than the rest, but he recognizes some passages as the work of revisers (*diasceuasts*) and continuators, and others as due to rhapsodists and other interpolators, who from one passage altered and added to another, down to the ordinary copyists. The Odyssey is thought by our author not to have suffered so much as the Iliad from common interpolations; in the first six books of the Odyssey no passage of a dozen lines in length is allowed by him to be an interpolation. The explanation for the better condition of the Odyssey is found in the greater popularity of the Iliad. That the Iliad was more read than the Odyssey in ancient times is indicated not only by the fact that the manuscripts preserved in our libraries are three times as numerous for the Iliad as for the Odyssey, but still more distinctly by the greater number of fragments of papyrus manuscripts of the Iliad recently found in Egypt, and by the pre-Alexandrian citations of the Iliad, occupying 44 pages in Ludwich's 'Homer Vulgata,' while less than 10 pages suffice for the corresponding citations from the Odyssey. The Greek scholia on the Odyssey are far less important, too, than those on the Iliad; but this is due largely to the inferior manuscript tradition. The Iliad, being more popular, was more subject to revision and interpolation. Thus, the Odyssey, as more nearly in its original state, is chosen by Blass as the basis of his work on Homeric interpolations. As was to be expected, he follows the Alexandrian scholars in rejecting all of the twenty-fourth book and about half of the twenty-third book of the poem. He rejects, also, about one-third of the eleventh book, which tells of the visit of Odysseus to the realm of Hades. But of the first book he rejects only forty-six verses, or about one-tenth of the whole, and of the sixth book only eleven verses, or about one-thirtieth. Evidence for the rejection of verses and passages is found in their omission in the early manuscripts, in their forming repetitions or interruptions of a clear connection, and in their causing inconsistencies in the story. Care is taken to avoid subjective judgments —such judgments as have made ordinary Homeric criticism chaotic—as to the fitness or grace of the lines in question.

The book is pleasantly written, and contains a large number of important suggestions for the criticism and interpretation of Homer. That it will convert the world of scholars to his views, probably the author himself does not expect, but it will give aid and comfort to many who, in spite of all difficulties, are fain to believe in the essential unity of the Homeric poems.

English Embroidery. By A. F. Kendrick. London: G. Newnes; New York: Charles Scribner's Sons. 1905.

This very useful book abounds in historical data as to the production of the finest examples of embroidery in England, where this art especially flourished during many centuries. Aldhelm, Bishop of Sherborne in the seventh century, mentions the skill Englishwomen displayed in embroidery; and in 747 there is record of an admonition to nuns, from the Council of Clovesho (Cliffe at Hoo), to spend more time in religious exercises than in the weaving and embroidery of robes. From chronicles of the Middle Ages we gather that not only priestly vestments were the work of nuns, but coronation robes and mantles were embroidered in convents—for instance, King Edgar's mantle, presented to the monks of Ely and transformed by them into a cope (956-978), and the coronation robe of this same king, which he gave as an altar decoration to the Abbey of Glastonbury. The monastery of Croyland was presented with the coronation mantle of Witlof, King of Mercia, in 833, and had two precious vestments given by King Harold. The shrine of St. Cuthbert at Chester le Street was especially rich in gifts of church vestments and properties through the bounty of King Athestan.

The women in England had in the feudal ages little to employ their time but spinning, weaving, and sewing; they had ample leisure to develop great skill in embroidery, and must have found in this art a means of expressing their artistic proclivities. Even royal ladies distinguished themselves: William of Malmesbury tells how Edith, Queen of Edward the Confessor, embroidered the King's rich robes, worn at festivals; and in later times Catherine of Aragon, Mary Tudor, Elizabeth, and Mary, Queen of

Scots all occupied themselves with needlework. The portraits, of different periods, which remain to us show how profusely costumes were adorned with needlework of every description. From very early times kings and ecclesiastics were buried in their robes and vestments, and this custom has happily preserved to us many precious fragments of archæological interest.

The designers of the subjects for embroideries are supposed to have been the monks and the clergy. They were most familiar with the legends of the saints and with ancient history. Archbishop Dunstan is known to have designed for such work and to have been himself a skilled handicraftsman. We are told that the names of men famous for their needlework have survived from the Middle Ages, but one cannot identify any special work in England done by them. The immense multitude of vestments produced appear in the inventories of cathedrals and parish churches; and although a great quantity have been destroyed, some at the Reformation, some for the precious materials in them, a great many still remain, in museums, in cathedrals and churches, as well as in private collections. The great reputation of "opus Anglicanum" in embroidery has been sufficiently demonstrated by the many fine vestments found in Italy and Spain bearing unmistakable signs of their English provenance. Many of these were offerings from English kings to the Pope, and distributed by him among his churches. We read of a "pluviale de opere Anglicano" from Edward I. to Pope Boniface VIII.; also of a cope sent by the Queen of Edward II. as a present to the Pope. Many are the records of royal gifts of vestments to cathedrals and churches. When monasteries were suppressed in Henry VIII.'s time, ecclesiastical work was less in demand; existing examples found their way abroad. Embroidery from that time served chiefly for personal adornment in England.

Some of the characteristics of the "opus Anglicanum," Mr. Kendrick tells us, are, notwithstanding its defects of disproportionately large heads, staring eyes and hair sometimes blue or green, and weak perspective, its great dignity of religious feeling, both in the figures and in the design. The treatment of the faces seems to have been very special, and affords convincing evidence as to the nationality of the work. In speaking of this characteristic Mr. Kendrick says, concerning the faces:

"These are generally worked in a kind of spiral, starting from the centre of the cheek; the effect is afterwards emphasized by the pressure of a heated iron instrument of rounded form. There are other characteristics which will be seen to be very usual in this 'opus Anglicanum' of the thirteenth and fourteenth centuries. The bearded figures generally present a shaven upper lip, and the foreheads are abnormally high and broad. The hair and beard are often of an unnatural color. Birds are frequently represented. . . . As regards architectural details, twisted or interlaced columns are not uncommon, and a leopard's head with protruding tongue—somewhat resembling the mark used for English silversmiths' work—is often found, sometimes taking the place of a capital. A peculiar foliated lion's mask occurs in several examples. In foliage the favorite types are the vine, oak, and ivy—especially the first. A great fondness is shown for the seraph or cherub on the wheel, borrowed from the vision of Ezekiel. Such angelic figures form a prominent feature in English embroidery from the thirteenth century to the sixteenth. It is natural, too, that English saints should be often represented. Among them St. Thomas of Canterbury and St. Edmund, the King and Martyr, occur most frequently."

The Syon cope is considered one of the finest examples of English work; it dates from the latter half of the thirteenth century, before the monastery at Syon, near Isleworth, was founded for Bridgetian nuns. It was given to that institution in its very beginning, and, on the dissolution of monasteries, the nuns carried their cope with them in their wanderings in Flanders, France and Portugal, and back to England in 1830. It was acquired in 1864 for the South Kensington Musuem, where it now remains. This cope is elaborately worked on linen, completely hidden by designs in gold and silver thread and silks of various colors. The ground is covered with quatrefoils in red with gold outlines interspaced with green. Each quatrefoil contains a picture from Holy Scripture; in the intervening spaces are three hierarchies of angels—also, two figures, one a layman, the other a cleric, each bearing an inscribed scroll now unfortunately illegible. The cope has further been shorn of three apostles out of the twelve. The orphrey, morse and outer border were later additions made from a stole and maniple which are covered with shields belonging to families of the neighborhood of Coventry, so that Dr. Rock, an eminent authority on these points, supposes the cope and orphreys to have been embroidered near that town.

The Madrid Museum possesses a very similar cope of nearly the same period of English work, in which the barbed quatrefoils are united by coiling dragons in the design. At Anagni, near Rome, there are in the treasury of the Cathedral some very ancient English embroideries, given by Pope Boniface VII., where, on the dalmatics, the martyrdoms of St. Thomas of Canterbury and King Eadward II. are represented. The splendid Ascoli cope acquired some time ago by Mr. Pierpont Morgan, and so generously presented by him to the Italian Government recently, on the representation that it had been stolen, is another example of this English work of the best period (1270 and 1330), and is remarkable for its great beauty of color.

An altar frontal belonging to Steeple Aston in Oxfordshire made from pieces of a cope of the early fourteenth century, is considered by connoisseurs a fine example. Interlacing stems of oak and ivy joined by foliated masks enclose the pictures of the martyrdom of saints and heraldic lions. On the orphreys, angels playing musical instruments are mounted on horseback, an original presentment of celestial messengers. The ground of silk must originally have been red, but is now faded to buff; the embroidery is in gold thread and colored silks.

The book contains many excellent photographic illustrations and some color plates of interesting examples. The decorative quality in the early English designs is very remarkable. In some instances it resembles Byzantine convention in its simplicity and directness of line. Mr. Kendrick does not go into actual stitchery, but treats of embroidery from its historic and decorative side. It is seldom that a book on a special subject is so interesting and readable throughout.

The Bank and the Treasury. By F. A. Cleveland. Longmans, Green & Co. 1905.

This volume, considerable parts of which have already appeared in various journals, attacks the problem of providing a more "sound" and "elastic" system of "current credit-funds" for the United States. The author believes that ordinarily too narrow a view is taken of the subject. On the one hand, the advocates of "assets-bank-currency" look upon the problem as a mere question of providing a safe and elastic banknote system; while, on the other, the friends of Government issues think that all difficulties will be solved by the issue of Treasury notes. Both groups of currency theorists, he says, fail to grasp the real needs of the situation, because they do not comprehend the truth which this volume presents, viz., that "our financial superstructure rests on two distinct and widely separated pillars—the Independent Treasury and the Commercial Bank," each of which has "its own burden and responsibilities." For Mr. Cleveland, therefore, the currency problem of the United States resolves itself into the establishment of proper relations between the bank and the Treasury.

After some introductory remarks about commercial banking, the author sketches briefly the history of our present currency system. At most points inadequate, these chapters not infrequently are positively misleading. Mr. Cleveland gives his readers to understand, for instance, that "the civil war occurred at a time when banking ideals had come to be well crystallized, and when the necessity for a common currency had come to be generally felt." That the country had suffered so much from unsafe banking that the need for national control ought to have been recognized, is undoubted; but to imply that anything save the conditions produced by the war could have led to the adoption of a national-banking system in 1863, shows complete unfamiliarity with the temper of our people at that time. Misleading, too, is the statement that for forty years the American banking system has been "entirely divorced from money-issue functions, except as an agent of the Government for the conversion of bonds into demand notes." It may be well enough to speak of the issue of national-bank currency as a conversion of bonds into demand notes; but the notes find their way into circulation through the ordinary banking operations, so that the divorce of the issue of money from commercial banking is far from complete.

The author next proceeds to criticise schemes for the issue of banknotes against general assets. He contends that they disregard the facts, that our present system has "grown out of American conditions," and that the systems which work well in other countries would not necessarily operate satisfactorily in the United States. All this has been heard before. We can at least concede to the author that there does not seem to be an overpowering popular demand for the introduction of general-asset banking into the United States.

Mr. Cleveland strongly believes that in any changes that may be made we should

not break with the past, but reshape or patch up existing institutions so as to make them work as well as they can. He does not think that the Independent-Treasury system should be abolished, or that this can be done until the Government retires its demand obligations. He suggests certain directions in which he considers it desirable to exercise stricter control over the operations of the banks in order to prevent them from straining their credit unduly, and believes that, with a few other changes, the existing banking system would meet nearly all reasonable requirements for soundness and elasticity. He would, however, allow greater freedom in depositing public moneys with the banks. But if that should be done, the reader will wonder why the author should then desire the continued maintenance of the Independent Treasury. In fact, the instructed reader will find not a few things in the book that will arouse his wonder—a wonder, too, not always mixed with the admiration to which the Greeks thought wonder akin.

King Leopold II.: His Rule in Belgium and the Congo. By John de Courcy MacDonnell. With 40 full-page plates from photographs, genealogical table and map. Cassell & Co. 1905. 8vo. Pp. viii., 391.

The sketch of the political and social history and international relations of Belgium under the present rule, contained in the opening and closing chapters of this book, will be found by some readers interesting and suggestive. The bitter contest between the Liberals and Catholics over the secularization of education, which was the main issue of the first part of Leopold's reign, is briefly described with a strong Catholic bias. A more detailed account is given of the rise of the Socialist party, and the consequent various legislative measures, the development of the coöperative societies, and the introduction of industrial training, to which the growth of the kingdom in wealth and intelligence during the last twenty years is largely due. Leopold himself gave a great impulse to this mutual-aid movement by his request to the Chambers that the two million francs to be expended in celebrating the twenty-fifth anniversary of his accession should be devoted instead to the foundation of a Fund for Injured Workmen. An evidence of the early inculcation of the value of thrift in the Belgian mind is the significant fact that in 1904 the deposits of 369,779 school children in the savings banks were a little over two million dollars (10,042,430 francs).

The main object, however, of Mr. MacDonnell is to tell once more the story of the origin and progress and methods of government of the Congo Free State, and to refute the charge that Leopold has not fulfilled the pledges made under the Berlin Act. In these chapters we find nothing new, but simply a repetition of the statements and arguments of the previous defenders of the present régime. The State is asserted to be "the most successful of the civilizing governments of this age," and its detractors are actuated wholly by motives of envious greed. To our author's charge that a hatred of Belgium is being actively fomented in England, a sufficient answer is to be found in the resolution adopted at a meeting of the Congo Reform Association held in London on June 7, 1905—a resolution offered by Sir Charles Dilke and advocated by the chairman, Sir Harry Johnston—"inviting the Belgian people (upon whom no aspersion was cast) to take up the administration of that State as a national task." The animus of Mr. MacDonnell's criticism of the Protestant missionaries in general for their mental weakness, their cheap sentiment, and the small results of their labors, is to be found in the assertion that they "are, as a rule, fomenting hatred of their rulers amongst the natives." The charge that their motives are either jealousy of the Roman Catholic missionaries or "the desire to see the country in the hands of English-speaking people" needs no refutation. As was to be expected, the laudations of the King for his unselfish interest in the negro and his unexampled generosity in the sacrifice of his private means to carry out his cherished purpose of civilizing Central Africa are numerous and extravagant. The illustrations are portraits and scenes in Belgium and Africa.

Oxford Silver Pennies from A. D. *925 to* A. D. *1272.* By C. L. Stainer. Frowde.

This, the latest volume of the Oxford Historical Society, is a study in numismatics. From its name we are bound to class it, first of all, as belonging to the literature of coinage; but, for the close of the Dark Ages, silver pennies are good historical material, when considered in the light of their geographical distribution, and even during the period which runs from the Conquest to the death of Henry III. they are not without their value. Mr. Stainer writes as one who would make a contribution to English history rather than to the antiquarian literature of Oxford; and that he has succeeded in illustrating a number of important points, no one can doubt who has read his introduction. The local coinage of Oxford is not unique in character, nor does Mr. Stainer claim for it any very remarkable features. Certain numismatists have gone so far as to style the Oxford mint a rare one, but it has not even this claim to distinction. In the great Colchester hoard, 5,096 pennies were from London, 4,122 from Canterbury, 457 from St. Edmundsbury, 247 from Winchester, 153 from York, 100 from Lincoln, and, after a gap of seven towns represented by places like Northampton, Exeter, Carlisle, and Durham, Oxford comes in with twenty-one examples. In the Eccles hoard of over 5,000 coins, the proportion is about the same.

But pennies mean very little in themselves, and need to be placed in line with the national annals by some one who knows history as well as numismatics. Mr. Stainer's study of Oxford money is rendered fruitful by his familiarity with the exchequer system at large, and his quickness to perceive the chief points of contact between local and national coinage. The same conclusions which he reaches concerning the development of the Oxford mint, might very well have been reached by an exhaustive study of pennies from Lincoln, Thetford, Cambridge, Dover or Lewes. The essential thing is that some one should have taken the pains to hunt down, catalogue, describe, and interpret the silver money of any English town of the period from Athelstan to Edward I. The distribution of these Oxford coins shows how widely they circulated, and throws a certain side light upon the extent of trade during the tenth and eleventh centuries:

"They have been scattered far and wide, thrown by the sea on the Isle of Skye, found in Ireland, unearthed in Rome, frequently discovered in Scotland or on the shores of the Baltic. Even at home they have been grubbed up by children, clenched triumphantly in little fists and thrown about as buttons."

Mr. Stainer devotes a good deal of attention to the position of the moneyer and the attitude of the crown towards him, but his most emphatic point relates to the existence of local coinage as affecting the national system. Properly speaking, every local mint was a royal one. "From the times when the archbishops' names disappeared from the obverse of their silver pennies, royal control became complete. There was no such thing as a private mint except in the lawless times of King Stephen." Wherever one finds a town or a magnate striking a local coinage, it only means that for convenience or by way of distinction the crown has granted this special privilege. Mr. Stainer's essay is scholarly and readable and fully illustrated.

Ireland in the New Century. By the Right Hon. Sir Horace Plunkett. Dutton & Co.

The author of this book is vice-president of the Department of Agriculture and Technical Instruction in Ireland. For many years he devoted himself and his fortune to promoting agricultural coöperation, and to his efforts is due the creation of the Department over which he presides. He was a Unionist member of Parliament for eight years, and one of the implied conditions of the post he holds is that he should have a seat in Parliament. His attempts on two Irish constituencies have, however, failed, and it is unlikely that he would be successful anywhere else. The Unionists object to him because he has allied himself in his cooperative schemes with Nationalists; and the Catholic clergy and the Nationalists, because he has frequently stated that he hopes, by turning the attention of the people to practical schemes of industrial activity, to divert their minds from the chimera of home rule, and counteract the "anti-economic" influence of the Catholic religion. His zeal for the coöperative movement is shown by the fact that his entire official salary, $5,500, has, from the first, been given wholly to the Agricultural Organization Society which he founded and managed before taking the official and paid post he now holds.

If it were not for the personality and official position of the author, his book would not have attracted the attention which it has in Ireland. It is dull, labored in style, pedantic, and egotistical. It might be considered impertinent for an official paid by the public taxes to write a book, the main purpose of which is to explain to the people who pay him their defects of character and temperament. The strongest Irish quality he thinks is "the craving to be understood," and his purpose is to explain the Irish people to themselves, to "concentrate thought on social and economic problems," to expound a practical programme of life and work, to wean the Irish from the "obsession of politics."

Sir Horace Plunkett writes of himself as the apostle of a new movement, as if no one before him had ever thought seriously on Irish problems, attained a "philosophic insight" into Irish character, or had the moral courage to tell the Irish what their defects of character are. Much space is devoted to enumerating the motes in the eyes of the Catholics, who are "apathetic, thriftless, almost non-industrial, and wanting in moral fibre"—offensive and useless platitudes. If Ireland could have been regenerated by such lectures, she would have been so long ago, for a perennial torrent of such advisory literature issues from the English press in the shape of books, pamphlets, and newspaper articles.

In an epilogue to the last reprint of his book, Sir Horace claims that his offence is the grave one of having criticised his countrymen, and that they cannot bear criticism; that his readers have failed to grasp his meaning, and to appreciate the exact purpose he had in mind when he decided to write this book. It is not criticism (to which the Irish are well used), but the manner and tone of the book which have given offence. Sir Horace holds an important office controlling the annual expenditure of about one million dollars because he is a party politician himself; but his advice to his countrymen is not to be troubling their heads about politics or Irish history. A non-Catholic, much of his book is given to criticism of the Catholic religion, the Catholic clergy, and the Catholic people. His "economic sense" has been offended by their profuse expenditure on churches, convents, and, incidentally, on schools under control of the Church; but he seems unaware of the fact that it was the class to which he belongs that took for themselves or else wrecked churches and educational institutions which once belonged to the Catholics; and for years prevented the Catholics either building churches or establishing schools. Are they never to supply the gaps and restore the ruins effected by Anglo-Protestant intolerance and barbarism?

As an unofficial missionary of coöperation, Sir Horace received the hearty support of the Catholic clergy and many prominent and earnest Nationalists—among others, of John Redmond, chairman of the Irish Parliamentary party. But on the issue of this unfortunate book Redmond wrote:

"I at one time entertained some belief in the good intentions of Sir Horace and his friends, but recent events have undeceived me; and his book, full as it is of undisguised contempt for the Irish race, makes it plain to me that the real object of the movement is to undermine the National party and divert the minds of our people from Home Rule, which is the only thing which can ever lead to a real revival of Irish industries."

This is no misrepresentation of the tenor of the book, for early in his career as a Unionist politician Sir Horace described the movement he was promoting in very similar terms. This ill-advised manifesto, then, has very much diminished the author's influence for good, and has alienated many of his staunchest supporters.

Christianity in Modern Japan. By Ernest W. Clement. Philadelphia: American Baptist Publication Society. 1905.

Professor Clement, author of a Handbook of Modern Japan, here attempts a survey of the moral forces which are now in full energy in Japan. The new man in the Mikado's Empire has an ever-widening horizon of ideas and ideals. As he entered into that full realization of national unity which necessarily came from outside pressure, he raised the cry of "Japan for the Japanese!" His second ideal is "Japan for Asia!" The third, which has been shaped especially since the new treaties went into effect in the summer of 1899, is, "Japan for the world!" The first ambition was merely a national, the second was an Asiatic, the present is an international or cosmopolitan Japan. Very curiously, "one of the most conservative institutions in Japan is the Department of Education, which often fails to keep pace with the general progress. It falls to the discredit of this department of the Government that the reactionary spirit lingers there longer than in most other places." In this judgment of the author, few foreigners familiar with the educational problem in Japan will fail to acquiesce. On the other hand, it is hard to see how it could be otherwise while the Government and nation have been so absorbed in material progress and military energies.

In his twenty-one chapters, which are appropriately illustrated with good half-tone pictures and reinforced with map, bibliography, index and tables, Professor Clement surveys his subject historically as well as descriptively, telling of preparation, foundation, popularity, reaction, and revival. He treats first of the various phases, Greek, Roman, and Reformed, of Christian work. He then discusses special themes, lines of enterprise, literature, education, and the philanthropic and sociological movements, pointing out also the great contrasts between 1853 and 1903. It would be difficult, we think, to handle the subject in a more liberal-minded manner. The Principal of the Duncan Baptist Academy in Tokio shows that the Roman Catholic Church throughout the East is noted for its splendid charities, and is doing more to care for the helpless, aged, and infirm than all the Protestant bodies combined. Occupying a relatively modest place in the work of publication and of education, she takes nevertheless the first rank in works of charity, spending about $50,000 on her twenty-one orphanages, and looking after the sick in the hospitals without regard to the rank or social condition of the patients. All the work of the Greek Catholic or Russian Church centres in every respect around one man, Nicolai. Coming to Japan in 1861, as Chaplain of the Russian Consulate in Hakodate, he made himself master of the language and literature of Japan, so that his preaching was singularly powerful. In Russia he raised the funds for erecting the white marble Cathedral of the Resurrection in Tokio, which is probably the most imposing structure in Japan. The building operations covered seven years, and the edifice cost nearly $100,000. A man of amazing labors, Nicolai at seventy takes little or no vacation. He has himself trained up most of his priests and pastors, many of whom, educated in Russia, are now engaged largely in ministering to the Muscovite prisoners and teaching illiterate Russians to read and write their own language—for the military prison schools of Japan are conducted on a plan somewhat different from those at Andersonville or Elmira. The manner in which the Greek Church Christians in Japan are taught to be strenuous in patriotism, while the Japanese Government guards from harm the Tokio cathedral night and day, is the best commentary on the words of Premier Katsura: "I sincerely hope no one will be betrayed into the error of supposing that such things as differences in race or religion have anything whatever to do with the present complication."

Professor Clement devotes one chapter to religious liberty in Japan, showing how thoroughly the present Government has put into liberal practice the constitutional provision for freedom of conscience. In a special interview had in 1905 by the author, the prime minister reiterated with emphasis his assurance that the constitutional provision is to be justly enforced. The most serious inroads upon national traditions, customs, and dogmas are made by the work of the Reformed or Protestant churches, which aim at nothing else than reconstructing, on a higher moral plane, the entire life of the people. The proofs that this is being done in language, in art, in social life, in political and social conceptions, are overwhelming. "Liberty," a term practically absent from the vocabulary of the old Chinese world of ideas, is now well domesticated in common speech. In books and newspapers, "quotations from the Bible are often used in the same way as are extracts from Japanese and Chinese classics and Buddhist scriptures." In a long and very valuable appendix, printed in the same type as the body of the work, Professor Clement shows that he clearly understands the similarity between the situation, or the "conflict," as Ulhorn calls it, in the ancient Roman and the modern Eastern world. The true improvement or "conversion" of the Japanese nation must be by evolution rather than by revolution.

While the tables of statistics are not only very full, but perhaps the latest and most complete, it must be remembered that the very best work by aliens for the making of the new Japan was done in those apparently hopeless years between 1859 and 1872, when the supposed fruitlessness of the work was proverbial. In literary proportion and breadth of view and in keenness of insight, this book is a model. It is all the more likely to be permanent in its influence because of its cool, judicial temper.

The Diseases of Society. By Dr. F. G. Lydston. Philadelphia: Lippincott. 1905.

Under this figurative title is discussed the very complicated problem of the causes and treatment of vice and crime. The attempt to cover so many conditions (correlated, it is true) is unsatisfactory. As monographs the parts are incomplete, and the whole is neither sufficiently unified for the ordinary reader, nor clearly cut for the student. Nor is the style attractive. Some common views are set aside and others are maintained in a way that is not persuasive; for while the soundness of a doctrine does not depend upon its popularity, sarcasm and invective rarely are good substitutes for analysis and argument. "In general the town 'conscience' is keener than the city conscience, because opportunities for concealment are less," and temptation is "not so abundant and potent as in great cities.

Human nature is fundamentally in no wise different in small communities, but the inhibition of fear of detection is greater" (p. 338). This is a roundabout way of saying that one is less apt to do wrong in the presence of those whose good opinion he desires. The author assumes "that normal man is naturally disposed to vice and crime," and that "the higher, or altruistic, social instincts of man are distinctly artificial," and then notes twenty distinct factors which especially induce the social diseases to which we are prone (pp. 90, 91). Conspicuous among these are the elemental passion, inebriety, heredity, and example, to which the unjust dispensation of the law, the lawlessness of capital and labor, and misapplied charity are contributory. It is better to enumerate than to analyze them here.

The trend of criminology is to emphasize physical asymmetry, especially of the skull, as a mark of the degenerate; and the degenerate is liable, if not certain, to develop into the criminal. A chapter, and an interesting chapter, on "Types of Criminals," meaning the physical types, is copiously illustrated. Doubtless aberrant brains are frequently housed in irregular crania, but it would hardly be safe to use the fitting machine of the fashionable hatter as a detective apparatus. The very singular indentations and gibbosities there displayed over a single cranial plane indicate that very few heads are entirely regular and shapely, but the bumps and the hollows need not be the insignia of vice any more than of genius. Moreover, to the tolerably observant eye, many of the faces here pictured suggest neither the homicides nor the other criminals to whom they belong. Some vices brutalize expression; but bias towards breaches of the moral law is not always clearly written on faces not hardened by frequent perpetration. It seems particularly true that those in whom there is a tendency to lapse from what is commonly regarded as the preëminent virtue, give no sign, before habitual indulgence, that may be read through the mask of convention, or indeed may be observed in the yet immaculate youth. How much less may one foresee the future forger, burglar, or murderer?

Dr. Lydston disapproves of capital punishment, which, he insists, is rarely deterrent and is liable to inflict irreparable injustice, and in this country is unequally administered because of the diversity of State laws. He advocates the indeterminate sentence, with a caution as to its application to occasional criminals, and especially to those who commit financial wrongs. He holds up Elmira as typifying the method by which the criminal is to be reformed if at all; and he commends the sterilization of the habitual criminal. Any one who is willing to inflict a life sentence, or to execute a wrongdoer, should look without disfavor on the prevention of procreation by those who are such a prolific source of hereditary physical disease and moral distemper. Or is there an inalienable right to infect society by the constant injection into it of recruits who, in the nature of the case, will almost certainly multiply ancestral vices?

Iowa: The First Free State in the Louisiana Purchase, 1673-1846. By William Salter. Chicago: A. C. McClurg & Co. 1905. Pp. 289.

The History of Negro Servitude in Illinois, and the Slavery Agitation in that State, 1719-1864. By N. Dwight Harris, Ph.D. Chicago: A. C. McClurg & Co. 1904. Pp. x., 276.

Indiana: A Redemption from Slavery. By J. P. Dunn, jr. New and enlarged edition. (Commonwealth Series.) Boston: Houghton, Mifflin & Co. 1905. Pp. xii., 506.

The three books above named have very little in common, save that they deal with a group of Western States territorially related, and centre to some extent in the slavery question. They all reveal the difficulty of telling the history of what is essentially only a geographical expression. While the history of the West is of great importance for a right understanding of our national development, there are some phases of that history which can be satisfactorily dealt with only by ignoring State lines altogether. Antiquarian or statistical studies readily lend themselves to the choice of a definite district; but the history of parties or of movements that were the outgrowth of national conditions cannot be considered to any purpose from the point of view of the particular State.

The difficulty in question has been experienced in an acute form by Mr. Salter, whose interest in Iowa arises from the fact of a lifelong residence in that State. In order to make even a small volume, he has found it necessary to go back to the period of discovery, and a third of the book is devoted to a sketchy account of the history of the Louisiana Purchase before active settlement of the Iowa region began. The beginnings of settlement, Indian wars, changes in the Territorial organization, and the final admission of the Territory, furnish the subjects for the remaining chapters. Mr. Salter has read most of the secondary accounts, and the story is told in a style that is clear, but without distinctive merit of any kind. Neither new knowledge nor original treatment of old information is in evidence. The book can be of little use to scholars, but doubtless is of some value for the general reader.

Mr. Harris's book is a cross between a scientific study and a popular narrative; it is, in fact, a popularization of work done for the degree of doctor of philosophy in the University of Chicago. The first five chapters, together with chapter viii., constitute a rather careful and valuable study of servitude in Illinois. The author has searched the newspapers and the public records, State and local, with great diligence, and the result is a brief, clear account of the status of the colored race, from the first introduction of slavery until the civil war. In a word, the conclusion of Mr. Harris is that the Northwest Ordinance did not put an end to slavery in Illinois. Under the form of indentured service, the "peculiar institution," in all but name, continued to exist, in Territory and State, for over half a century. The rest of the book is devoted to the rise and growth of slavery agitation in the State. Almost necessarily this part is unsatisfactory. The development of that agitation was wholly independent of State lines, and inevitably the narrative degenerates into a mere popular account of national parties during the two decades previous to the civil war. Had the author made a study of servitude in the entire Northwest territory, or had he made a careful statistical study of party votes by counties in Illinois, the result would have been more profitable.

Mr. Dunn's 'Indiana' is a revised and enlarged edition of the original, which appeared some fifteen years ago in the "American Commonwealths" series. Of revision there is very little. The book, so Mr. Dunn assures us, has in the main stood the test of criticism. The few corrections that have been made are indicated in the preface. The "enlargement" consists of an additional chapter of about fifty pages, entitled "The Growth of the Commonwealth," which deals with the history of Indiana since its admission as a State, the original edition having been confined wholly to Indiana as a Territory. Whether this addition was a concession to criticism or not, it hardly improves the work. If there was a certain incongruity, considering the title of the series, in confining the original work to the Territorial period, it was, nevertheless, as it stood, an excellent account of the history of Indiana Territory in its relations to the growth of the nation—a fact which was exactly indicated by the subtitle. In its present form, the work presents the still greater incongruity of a book purporting to cover the whole history of Indiana, of which one-tenth is devoted to the State and nine-tenths to the Territory. On the whole, therefore, the present edition is neither better nor worse than the original, and its value is already so well known to scholars as to need no additional comment.

Œuvres Complètes de Flavius Josèphe, traduites en Français sous la direction de Théodore Reinach. Tome troisième: Antiquités Judaïques, Livres XI.-XV. Traduction par Joseph Chamonard. Paris: Ernest Leroux. 1904.

This volume covers the period from the decree of Cyrus (537 B. C.) to the completion of Herod's temple (19 B. C.). The edition is brought out by the Société des Études Juives, which employs learned historians and antiquaries as well as good literary writers. The translation is excellent; but for the reference to the Greek text and its various readings, in the footnotes, the reader would hardly ever think of his having a translation before him. It is certainly a great improvement over the heavy style of Whiston, even to a man of English speech with only a book knowledge of French.

Théodore Reinach, in the main a Greek antiquary, who has spent many years in Hellas and on the island of Crete, directed the translation; which means that he chose between the many, often wide, divergences of the manuscripts, and occasionally offered a bold emendation. He also wrote most of the footnotes, and in these he criticises less the errors or guesses of the copyists, through whom the text has come down to our day, than the credulity, the slovenliness in the use of material, sometimes also the falsifications and inventions, of Josephus himself. As M. Reinach does not profess to be much of a Talmudic scholar, he allowed others to write most of the notes in which the statements of Josephus are compared with passages in the Talmud.

Earlier editors and critics have long since rejected many of the finest stories in this part of the 'Antiquities' as lacking all basis of historical truth—such as the wonderful account of the seventy sages rendering the Jewish Laws into Greek for the Library at Alexandria at the Egyptian King's command—a tale which Josephus copies almost literally from the forged letter of Aristeas. No one can read the account of Joseph the taxfarmer with his elder sons and his youngest son, Hyrcanos, without being strongly reminded of the 'Arabian Nights'; the find of a great treasure of silver by a Hasmonean king in the tomb of David reads like a clumsy invention. Mr. Reinach also rejects both the Jewish and the Samaritan stories about Alexander the Great, as Josephus tells them, and holds that the Macedonian king never saw either Jerusalem or Samaria. He denies, or strongly doubts, the genuineness of decrees, proceeding from the Roman Senate or from Greek cities, in which the Jews as a nation are named as allies, or in which the rights of citizenship are conferred on Jews living in Roman or in certain Greek settlements. In fact, Josephus himself confesses that Greek authors of his time dispute the authenticity of such documents. What is much worse, however, Josephus assigns to some such decrees the wrong time and the wrong subject—for instance, a Roman senatus-consultum which is meant for Hyrcanos the First, he refers to Hyrcanos the Second. But Josephus has been treated critically for a long time—for instance, by Scaliger in the sixteenth century, by Selden in the seventeenth (in his 'Successio Sacerdotum), and by others down to Wellhausen late in the nineteenth, and Niese in the twentieth; and many of Reinach's predecessors thought no better than he of Josephus's value as a truthful historian.

It is a genuine pity that even the plainest facts in Jewish history between the decree of Cyrus and the revolt of the Hasmoneans, a period of 369 years, should, save for a few scanty and perhaps untrustworthy notices in Ezra and Nehemiah, be so much of a blank that the Talmudic tradition shortens this period by nearly 200 years. Even the line of the high priests cannot be made out; nay, as to the time when the greatest of these dignitaries, Simon the Just, wore the mitre, the authorities differ by as much as fifty years. The great Pharisaic sages who figure in the Mishnah as the heads of the Sanhedrin, are, barring two names, not mentioned by Josephus; not even Simeon ben Shetah, the kinsman of Queen Salome, who brought his party back into power. Thus the two sources of Hasmonean history, Josephus and the Mishnah, are rather in conflict than in harmony. And there is hardly any chance that anything like the Egyptian papyri or Babylonian clay tablets will ever be dug up to throw the light of contemporary writings on this or any other period of Jewish history.

With all his defects, Josephus is worth reading. Let us hope that this eminently readable French version will inspire some British or American society to bring out a comparable version in English.

AN EDUCATIONAL DIRECTORY.

I.—The Nation stands alone in its field. It has a larger circulation than any other politico-literary journal published in this country, going to all the principal libraries and reading-rooms, and into thousands of families.

II.—The circulation is chiefly among the thinking and well-to-do classes—lawyers, physicians, bankers, and other professional men—and in the homes of cultivated people, where the education of children is a matter of careful consideration.

III.—The School List in The Nation has been a representative one for many years. It includes cards of most of the prominent educational institutions everywhere, during the season of school advertising, and a considerable number are inserted in the paper throughout the year.

IV.—The rate is reasonable, and discounts are made on continuous insertions, of which most of the school advertisers avail themselves.

School advertisements are printed in a uniform typography, with the address in the first line, classification being made by States, alphabetically, unless especially ordered displayed on other pages.

Advertising rates, 15 cents an agate line each insertion, with the following discounts: 5 per cent. on 4 insertions, 10 per cent. on 8 insertions, 12 1-2 per cent. on 13 insertions, 15 per cent. on 26 insertions, 20 per cent. on 39 insertions, 25 per cent. on 52 insertions.

The *Nation* is sent free while advertisement continues.

Orders may be forwarded through any responsible advertising agency, or directly to

The Nation, 206 to 210 Broadway, N. Y.

Among Standard Macmillan Books

Prof. Edward Channing's A History of the United States

Volume I. "The Planting of a Nation in the New World"

"From Professor Channing's beginning it is evident that his will be a standard history. He writes with perfect independence after weighing all the testimony. He is very sober-minded, with a preference for moderate statement, and for reducing legends to their lowest terms. He leans to the critical rather than to the narrative side. As there is in America no historian more careful and thorough than he, and none more loyal to the scientific method, so it is noteworthy that he has given great attention to the literary form of his history. From the promise of his first volume one may predict that he will hold for years to come a position similar to that held by Bancroft in an earlier generation."
—WILLIAM ROSCOE THAYER in *The Atlantic Monthly.*

IMPORTANT BOOKS NEARLY READY

Government Regulation of Railway Rates

By Professor HUGO RICHARD MEYER of the University of Chicago.

In particular the author points out with unexampled clearness the respective advantages and disadvantages of the two opposing policies, the foreign policy of equality of charges for equal services, and the American policy of charging what the tariff will bear. Professor Meyer's sources are authoritative, his details are explicit, and his statements are clear and concise.

Restrictive Railway Legislation By HENRY S. HAINES

The author follows the growth of railroad legislation corresponding with the development of our national railroad system in its several fields of activity; in railroad incorporation, finance, construction, operation and tariff. Chapters are devoted to rate-making, theoretical and practical, and to a discussion of the bills now before Congress.

THE BEST NEW NOVELS

Mr. Maurice Hewlett's "The Fool Errant"
is uniform with his earlier romances, "The Forest Lovers," "Richard Yea-and-Nay," "Little Novels of Italy," etc.

Mr. Robert Herrick's "Memoirs of an American Citizen"
by the author of "the Common Lot," is attractively illustrated from over 50 drawings by F. B. Masters.

Barbara's "At the Sign of the Fox"
by the author of "The Garden of a Commuter's Wife," is issued with a frontispiece in colors.

The price of each is $1.50. All are published by

THE MACMILLAN COMPANY, 64-66 Fifth Avenue, New York

The Nation.

NEW YORK, THURSDAY, JULY 27, 1905.

The Week.

An extra session of Congress is to be called for November the eleventh. The regular session convenes on the first Monday in December. It is safe to predict that there will be more than "a constructive recess" between these two sessions, for our M.C.'s are not to be done out of their mileage a second time. Exactly what useful purpose is to be served by such a hurried session it is hard to say. It will, indeed, enable President Roosevelt's defenders to urge that when once he has expressed his determination on a public matter he does not "flinch." Originally, Congress was to be summoned in September. Then the bright October days were thought more suitable. The final decision to call together our lawmakers in the middle of November serves to keep the President's promise to the ear. In the extra session the activity of our Federal Legislature will have to be brisk indeed to keep pace with the questions they are to consider. Before making "the dirt fly" at Panama, it must be ascertained whether a sea-level canal or a lock canal is desired. The question of rebates and other railroad legislation must be mooted. And now we hear that the leisure of Congress will be occupied with discussing the proposal of Federal supervision of insurance. The kind of legislative mill that will grind out laws on these three subjects in a working time of about two weeks will deserve the name of "doing things."

President Roosevelt has stood by another friend in trouble, and appointed John McMackin consul at Georgetown, British Guiana. As Commissioner of Labor in this State, Mr. McMackin took the duties of his office so lightly that, when his term expired, charity workers and others interested in the condition of laboring men protested against his reappointment. They alleged and proved that he failed to enforce the laws, and was particularly negligent in the matter of illegal child labor. Gov. Higgins thereupon refused to name McMackin for another term. This was, of course, tantamount to a certificate of inefficiency, which seemed to Mr. Roosevelt to qualify McMackin admirably for a consulship. We appear to be unlucky in our consuls at Georgetown. The retiring official, Mr. G. H. Moulton, had some unpleasant things said about him in the Georgetown *Daily Chronicle* of June 23. He seems to have been indulging in a little extra-consular business, *à la* Loomis, and sued in the courts for a contingent fee of $5,000. The suit was dismissed with costs. In its comments on the case, the *Chronicle* said that it was "inconsistent with the function of an officer in the service of a great country like the United States . . . that he should be at liberty to exact commissions." It added that, as a result of Mr. Moulton's too keen eye for private business, "the consul leaves the colony with a reputation far different from that which he enjoyed only a few months ago."

What is there in the air of Caracas that sets so many United States officials wild to make money? We had a little while ago the evidence of the way in which the President's friend Loomis, when Minister there, was hot after a little matter of one-seventh of $10,000,000 as contingent fee, and now comes a friend of the friend, Consular Agent Dolge. The story of his hopeless mixing up of official duty and private money-making would seem incredible had not Mr. Dolge himself certified to its truth. His more than infantile innocence about the whole affair is the most amazing part. "Yes, yes; I am putting the United States coat-of-arms on my laundry; I am dabbling in this business and pushing this concession, but what of it? I admit it all, but what next?" What ought to come next is action by the State Department. It is not strange that, after the Loomis coat of whitewash, we should have Uncle Sam's coat-of-arms on a Venezuelan laundry, or any other scheme of an official "on the make"; but surely the authorities must see that this kind of thing cannot go on. Mr. Dolge has made it ridiculous.

In strict logic it would be hard to find a reason for getting rid of Statistician Hyde from the Department of Agriculture that does not apply likewise to Secretary Wilson himself. If the sins of subordinates are to be visited upon their superiors, the process can hardly be stopped short of the executive chiefs. But newspapers in the West, and especially his own State of Iowa, have been prompt to rally to Mr. Wilson's defence. "He has been at the head of a department which annually expends $5,000,000," says the *Register and Leader* of Des Moines, "in the interests of an occupation that annually produces $5,000,000,000, and in that length of time [eight years] has made it the greatest scientific organization in the world." As a matter of fact, the discovery of graft in that department was unexpected. If ever a Cabinet officer took pride in his work, Secretary Wilson did. If any Washingtonian had been asked six months ago—or to-day, for that matter—what high Government official was most closely bound up in his duties, he would have been likely to answer, "James Wilson." A practical farmer, as well as a former professor of agriculture, he followed the various activities under his charge with understanding and sympathy, while, as for experience, he has already surpassed in service all but three of the men who ever sat in the Cabinet room. But he did not see what was going on under his nose in a service which, as Mr. Hyde truly says, was "always under fire," and therefore a special object for executive vigilance. That his proper pride in his work should have grown into inability to see what was wrong in it, is what he has personally most to regret in the present scandals.

The feature of the national reciprocity conference, called to meet in Chicago on August 15 and 16, which is attracting serious attention, is that the movement originated in the West. Bodies like the Illinois Manufacturers' Association, the Board of Trade of Chicago, the National Live Stock Association, the Cattle Raisers' Association of Texas, and other similar organizations have joined in the call for the convention. A special point is made, too, of the fact that the men who are doing most to render it successful are not politicians. Most of them are Republicans, however, who have long since lost their superstitious awe of the Dingley tariff. Of course, the packers and stockmen are urged to seek reciprocity because of the attitude of Germany, which threatens, after next March, to exclude practically all American meat, as well as breadstuffs, from her markets. But the dairy interests also want to know why Central America, Cuba, and the West Indies prefer to take butter from the Netherlands, and the fruit raisers of Maryland are anxious to find out the reason for their poor foreign trade. Driven from Massachusetts, boycotted by China, punished by Germany, and now held up by the Middle West as a throttler of trade, the stand-patter has but one refuge left—the Senate. Perhaps, in time, the Senate, too, will cease to be a glorified Home-Market Club. Mention of this body, by the way, reminds us that we did Lieut.-Gov. Guild of Massachusetts unintentional injustice last week. He has not sought to conceal, nor has he abandoned, his old attitude towards reciprocity.

It is a lingering death that the Chicago teamsters' strike has died. Though actual dissolution did not occur until Friday, the case had been so long adjudged hopeless that for weeks the news

of it had been treated as of secondary importance. What this prolonged conflict has cost to both parties is almost past estimating. The city of Chicago has had to spend far more than it could afford for special police protection; the loss of business to the firms affected has been enormous, and the loss of wages to the men called out—the simplest item to compute—is a staggering sacrifice. But the teamsters' strike deserves to be long remembered as the perfect type of all that is erratic, futile, and discreditable in unionism. It was a sympathetic strike for the benefit of workmen in a non-allied trade, who did not want it. Waiving that, moreover, the garment workers supposed to be benefited numbered only a score, while four thousand teamsters stopped work. Violence and venality, too, in their worst forms were disclosed while the strike was in progress. Such a strike could not and never did have public sympathy, and it rightly ends in ignominious failure. Credit belongs to the authorities who—in spite of early paltering and weakness—did preserve order and protect street traffic, making the issue certain. As it is, there is a most impressive lesson for all decent workingmen of the dangers that lie in crazy, truculent, and unprincipled leadership.

Union labor in Chicago has had a taste of the medicine which some of its zealots have been dealing out to the "scabs." An effective "wrecking crew" made things lively for a time on Sunday week at an election of the Chicago Federation, tearing up the ballots, smashing the furniture of the hall, and beating one of their own leaders into insensibility. The full accounts of the affair furnished by the Chicago newspapers have a familiar look. Michael Donnelly, president of the Butchers' Workmen Union, was to be "done up." The "wreckers" were stationed at the door. As Donnelly entered, a slung-shot laid him out, then eight pairs of boots began to beat a tattoo on his ribs. The election officials had already been locked up in a side room, their ballot-boxes smashed and ballots destroyed, and, when Donnelly had been attended to, his assailants escaped unhindered and apparently unrecognized. President Dold of the Federation says that he cannot "imagine the motive for such a disturbance"; and President Shea of the Teamsters' Union calls it an "outrage." Why should Mr. Dold be astonished? Is he not familiar with the testimony of men, like the notorious Driscoll, who have admitted that hired ruffians are kept on the pay-rolls of those who would use the unions for their own ends?

John Mitchell's somewhat impressive reminder to the convention of Mine Workers at Scranton on Wednesday week that their contracts with the coal operators expire on April 1, 1906, is anything but comforting to the coal-burning public. For eight and a half months more the truce is to last; at the end of that time the mining regions will go back to the same conditions that existed in previous years. What is alarming to the country at large is the preparation which both sides are making for a long and bitter fight. We have recently had shrewd estimates of the depth of the Union's war chest, while, on the employers' side, as Mr. Mitchell said, "on every hand stockades are being built. Places are being filled with every available pound of coal." That both sides are preparing for the worst does not, of course, necessarily mean that it will come. It may be doubted if any outside intervention could this time avert a conflict and the terrible suffering which it entails on the innocent public, and we may be in for a renewal of that continental squeeze which was on the point of collapsing when President Roosevelt intervened in 1903. Now, it is more than hinted, anthracite and bituminous unions will pull together.

The New York Legislature has decided, at Governor Higgins's instigation, to institute an immediate inquiry into the life-insurance business in this State. The Equitable's one hope of future growth is to have itself officially declared disinfected and purified. As for the other companies, particularly the Mutual Life and the New York, they have suffered by the general distrust of insurance methods created by the Equitable revelations. People are everywhere scrutinizing insurance propositions and cross-questioning agents as never before. The shortcomings of Superintendent Hendricks, the conspicuous omissions from his report, the general belief that important Republican politicians besides Mr. Depew are gravely involved, the wobbling of the Governor, have all made a very bad impression, especially beyond the borders of the State. This is only heightened by the dismissal of the Controller of the Equitable and the failure to trace the mysterious loan of $685,000 which, until recently, seems to have stood upon the books of the Mercantile Trust Company. The legislative investigation means that light will be thrown into every dark corner; that the public will be acquainted with every step taken and every question put to the witnesses, who certainly should include every person in any way connected with the scandal.

Mr. McAdoo's calling upon the colored people of the riotous district in this city to surrender their weapons is a step in the right direction. But they are entitled to inquire why they should be compelled to disarm, and not the riotous white people around them as well. After the testimony of ill-treatment of the negroes by the police given last week by various apparently trustworthy witnesses, Mr. McAdoo ought to initiate without loss of time a searching investigation into the whole trouble. Here is where an advisory committee of citizens might render him much greater service than by telling him what officers to promote and what to pass by. It must not be forgotten that the fierce riots of three years ago were largely due to scandalous police brutality. This was conclusively proved at the time by the City Club, but no policeman was punished. So far as the whites are concerned, the best-informed white student of the negro population writes us as follows: "If only the white people don't get off scot free! They are much the more aggressive, particularly those on West End Avenue." But Mr. McAdoo seems to have jumped to the conclusion that the negroes are to be held responsible without further inquiry. If the whole affair does nothing else, it ought once more to call the attention of social workers and philanthropists to the low condition of both whites and blacks in the district between Sixtieth and Sixty-fourth Streets and between West End Avenue and Tenth Avenue. Here is a field for missionaries which ought to be taken in hand by the leading churches of the city.

Ex-Secretary Lamont's premature death is a distinct loss to the Democratic party, of which he has been of late an eminently wise counsellor. A quiet, unassuming man, he was none the less possessed of exceptional ability, and he fairly earned the Secretaryship of War with which Mr. Cleveland rewarded him for most devoted service when the ex-President took office the second time. In that position Mr. Lamont made an excellent record. We are inclined to believe that political influence was at a greater discount in the War Department during his incumbency than during any other recent Administration. Many of the reforms carried out by Secretary Root were suggested or asked by Mr. Lamont in his annual reports. But Congressional interest in the army had not then been stimulated by the war with Spain and the scandals of the Alger régime. Hence it was left to another to achieve the reforms Mr. Lamont desired. The appointments to generalcies and other important offices made during Mr. Lamont's incumbency bore extremely slight traces of the personal and political favoritism which has been the rule since. Modest and clean-handed personally as he was, Mr. Lamont was as far removed from the Paul Morton and Loomis type of latter-day statesmanship as he was from the George Fred Williamses and Altgelds on the Democratic side.

Senator Cullom's plans in his coming campaign for reëlection are as praiseworthy as they are novel. In a word, he proposes to build up organizations in every Illinois county without employing Federal officeholders to lead them, or, contrariwise, appointing their leaders to Federal office. What the Federal officers will find to occupy their time in the future, if the Cullom plan spreads, is hard to conjecture; but, at all events, this rash disregard of precedents by a distinguished septuagenarian is so remarkable as to need explaining. It is, in effect, a confession of the great potency of the outcry against the "Federal crowd" which was raised in so many Western States last year. The services of a compact body of lieutenants, well paid by the national Government, are obviously valuable. But the patronage-dispensing oligarchy of the Senate has come to be more and more distrusted. La Follette, in the State next door to Illinois, made most artful use of this feeling against Senator Spooner's faction. In Illinois, it has been abundantly demonstrated, by Mr. Deneen's nomination among other things, that the Federal influence is by no means all-powerful. Senator Cullom is simply confessing this when he begins his canvass, not as the head of an "organization," but alone as a public servant asking approval after many years of service.

From Viscount Hayashi's interview, obviously in retort to M. Witte's, it appears that both are willing to see the war go on unless the terms of peace are favorable. There is too much of this sort of talk. It is perfectly understood that when the plenipotentiaries exchange ideas at Portsmouth, there will be a wide gap between bid and asked, but meantime there is no use in anticipating and perhaps compromising the inevitable bargaining by vague controversy. Viscount Hayashi's rather scornful observation that Europe must remember the Japanese are not angels, must rank with Salisbury's cynicisms. The reminder, for that matter, was hardly needed. Nobody supposes that the Japanese are angels, but it is believed that they are cool heads and will enter the Peace Conference with a very clear idea of the purposes of the war. It is understood that, aside from the obvious motive of natural defence, a desire for prestige and recognition as a civilized Power lay behind the Asiatic campaign. The admiration of the civilized world Japan has already abundantly earned; it remains now to get the good will of the world. To obtain not only prestige, but friendship, Japan can afford to pay something. From this point of view, to show magnanimity to Russia would require not an angelic host in the Foreign Office at Tokio, but simply an enlightened expediency in control. Japan is at the parting of the ways: it remains for her to choose her rôle. To play the ruthless conqueror now will involve her in burdensome military expenses for an indefinite period, whereas every seeming advantage sacrificed for the sake of peace will be soon repaid by savings in the military budget.

Agreement at the first session of the conference could occur only by a miracle. That the envoys should meet with radically divergent views and by reciprocal concessions gradually approach an understanding, lies in the very nature of the case. Nothing that has yet been said indicates more than the normal difference of opinion at the present stage of the transaction. Nor is there any disturbing force in the somewhat pathetic plea of China to be admitted to the conference, for that plea—respectable as is the desire of a patient on the operating-table to be consulted as to the extent of the proposed amputation—can hardly be granted. To admit it would only complicate matters already difficult enough. The circular note from the Yamen to the Powers is merely notice that China will not necessarily be bound by such disposition as Japan and Russia may make of Chinese territory. From the principle that any Mantchurian settlement will require a supplementary agreement between China and Japan, no one will seriously dissent.

The "inspired" account of what Emperor William would say to the Czar, in their Baltic Sea interview, was shrewdly put out by the German Foreign Office. Nor does the keen prevision it evinced convict the Emperor either of lack of alert self-interest or of hard-headed common sense. It is not to be supposed that a Hohenzollern has any strong hereditary sympathies with movements making for a democratic participation in government; yet it may be readily surmised that William would counsel his imperial brother in Russia to "grant reforms" purely on the ground of an intelligent preference for a limited monarchy rather than a revolutionary, not to say a chaotic, republic on Germany's eastern frontier. The Kaiser is also officially credited with intending to say that "the German Government is interested in having the neighboring country peaceful and prosperous, for it is towards the Russian Empire that Germany's manufacturers look for great trade expansion in the future." This last dictum runs counter to the economic philosophy of the man in the street. That wise individual is commonly given to wagging his head when war is declared, and prophesying good times for neutral nations.

Mr. Balfour's defeat on an amendment concerning the Irish Land Commission was not in the nature of a snap vote. The division was taken after protracted debate, and there were nearly four hundred members in the House. It is clear that the best efforts of the Government whips were unable to offset the defection of the Irish members. What a Government beaten by a majority of three in a vote on supply shall do is largely a matter of taste and expediency. Several courses are open: the rebuff may be accepted silently as of slight importance, or the clause may be resubmitted to Parliament. On the other hand, a defeat on so prominent a point of Ministerial policy as the Land Act is by no means to be minimized. It is, at the best, a clear indication that the elaborate programme of Irish conciliation has failed utterly, and that the Government can be put in peril whenever Mr. Redmond's group chooses to take the necessary pains. Lord Rosebery, in June, 1895, went out on a similar rebuff. On a vote to reduce the salary of Mr. Campbell-Bannermann, Secretary of War, several of the Radicals refused to support the Government, and the censure was passed by a majority of seven in a small House. Campbell-Bannerman's resignation was followed by that of the Ministry. This well-remembered incident has not shaken Mr. Balfour's resolve to stomach the mishap and stick to office and he is already stretched on Mr. Redmond's rack.

A resolution of the coalition majority of the Hungarian Diet proclaims a political state of siege against the Fejervary Government. All patriotic Magyars are exhorted not to pay taxes or render military service, and local officials are told to disregard the orders of the national administration. Thus the party, though justified in attacking the constitutional standing of the Premier, is taking steps that may lead to secession. The situation is so serious that it seems likely that the King must withdraw Fejervary's "business" Cabinet, and reopen negotiations with the Kossuthists. Then the majority must either agree to a government on constitutional lines, or remain in the present attitude of semi-revolutionary impotence. No serious observer believes the time is ripe for an independent Hungary, and it is highly important that the energies now expended in fighting for the "word of command" and for fiscal independence should be directed to a frank and thoroughgoing revision of the organic alliance between Austria and Hungary. Evidently so difficult a task cannot be undertaken until the present passions have quieted. It will strain the great personal resources of Franz Josef to find a *modus vivendi*, and turn the present revolutionary current into channels of constitutional revision.

A RENOVATED ERMINE.

It was urged in Judge Hooker's interest that his proposed punishment was heavier than his offences made fitting. Peccadilloes, it was said, should not be treated as if they were capital crimes. But it was really not the extreme penalty of the State Constitution that was invoked against Judge Hooker. He might have been impeached, under Article VI., Section 13. In that case, judgment might have extended to "disqualification to hold and enjoy any office of honor, trust, or profit under this State." But the mere process of "removal of judges," provided for in section 11, carries with it no such disqualification. It is, in fact, precisely that milder form of punishment which was so much desiderated last winter in the Swayne impeachment at Washington. If Congress had been able merely to remove Swayne, as the Legislature might have removed Hooker, it is quite possible that the Federal judge would not have escaped. And if Judge Hooker had been simply removed, there was nothing to prevent him from immediately seeking reëlection. But he was not removed, and still many newspapers are railing at him. They speak of him as if the failure of the Legislature to remove him had not put his character, and his fitness for the bench, in an entirely new light. This seems to us perilously near displaying contempt of court, which, in this case, we ought sedulously to conceal, as the lawyer said. Moreover, it is to show disrespect to the majesty of the law. The State has resorted to the legal process laid down in the Constitution for removing corrupt or unfit judges. Hence, clearly, the fact that the process failed in the instance of Justice Hooker, proves beyond a peradventure that he is neither corrupt nor unfit.

For note the impregnable legal status which Judge Hooker now enjoys. He can hold his head high. He is in the same category, legally, as Dick Croker, who killed a man but could not be convicted of murder. He is, again, in the enviable position of Nan Patterson, who went forth a free and proud woman because the jury could not make up their minds that she was a proved murderess. On the very day that Judge Hooker got his unequivocal vindication, Congressman Williamson received a similar one in Portland, Oregon. The latter was tried for land frauds, but only ten of the jury voted to convict him. That was not a Constitutional verdict of guilty, just as the 76 votes for the removal of Judge Hooker did not make up the Constitutional two-thirds; and both Williamson and Hooker are, therefore, innocent men in the eye of the law. Some impatient readers may exclaim with Sir Walter Raleigh. "That is to make the law a toy. I stand on the fact." But they should remember that Raleigh was, nevertheless, beheaded, and should take warning against speaking ill of the law or its ministers.

In legal effect, Judge Hooker is now an ornament to the bench. His brother justices will be delighted to sit with him. They will not feel like drawing aside lest contamination spread from him to them. His ermine is now, legally, as spotless as Jay's. It has been put through the legislative renovator, and, though it may smell of chlorine for a few days, and look a little "spotty" to a keen eye, that will all soon be forgotten, and the judge will resume, with the *Judicious* Hooker, his praise of that law which is the mother of our peace and joy. His brethren on the bench, who testified that they knew nothing of the offences with which he was charged, but that they considered him a "fine man and a fine judge," will be able better than most of us to appreciate the legal nullity of the fact that 76 members of the Assembly voted for his removal. If 24 more had voted the same way, the Supreme Court judges would have recoiled in horror at an unworthy colleague; but the Constitutional number not having voted, they know that absolutely nothing stands against him on the record, and that he is as much entitled to the respect and honor of his fellows as any criminal about whom a jury has disagreed. Yet with this legal aspect of the matter so clear and beyond dispute, purblind newspaper writers are lugging in extraneous considerations of public policy and morals!

For our part, we will not add to the ungenerous allusions to Judge Hooker's past. That is all sponged from the slate. He is made an upright judge by the fact that a majority of only 9 voted in the Assembly that the evidence proved him crooked. We have had too much innuendo directed against the judiciary not to rejoice when a suspected judge comes off so triumphantly as Justice Hooker. He may hereafter hold court in perfect legal security—even greater than that of the English judge who thanked God that he could not be removed except by the action of both Houses of Parliament. Judge Hooker may preside over the trials of grafters and political corruptionists with a good (legal) conscience. He may writhe inwardly as the testimony takes a turn unpleasantly parallel to his own successful "beating of the law" and his procurement of the appointment of debtors and dependents and relatives, but outwardly he may take his stand on the law with the heroic pose of Shylock himself. "The Legislature did not remove me, did it? Then what are you talking about?"

There has been so much confusion about the exact legal effect of the Hooker trial that we have thought it desirable to be thus precise. It is, indeed, difficult to be patient with those who are urging irrelevant matter. They allege the deep sense of injury and disgrace which the people of this State feel; but that is purely *aliunde*. They affirm that no self-respecting lawyer will appear before Judge Hooker if he can possibly avoid it. We reply, that is not *ad rem*. They point to the grave political consequences; show that Odell and his tools intervened to save the day for Hooker, and ask what will be the effect on the Republican party of the demonstration that it cannot keep even its own judiciary clean. But there ought to be another Gallio to drive such irrelevant objectors from the judgment-seat. All this is beside the mark. The desired removal of Judge Hooker could not be had. In the noble words of the Republican leader of the Assembly, the Legislature said to him: "Go and sin no more!" With that high title to the confidence and esteem of the public, Judge Hooker once more takes his place upon the bench.

ENGINEERING CONDITIONS IN THE NAVY.

The explosion of the *Bennington's* boilers, in the harbor of San Diego, recalls vividly Admiral Melville's warnings before his retirement from active service. He declared that he had seen torpedo boats, cruisers, and battleships laid up with injuries "due to careless and ignorant handling of costly machinery"; that the engineering situation had grown very critical; that too much reliance was being placed on the warrant machinists, and that a special engineering school for some of the younger officers was imperatively needed. On the other hand, Rear-Admiral Rae, the present chief engineer, is a firm believer in the amalgamation of line and staff, although realizing the need of more engineering experts. Just what condition the navy's engines are in, no layman can satisfactorily determine. Reports of speed trials strangely conflict. Some experts advocate a return to the days of special engineer officers, instead of requiring every line officer to be an engineer as well as a master of gunnery, a navigator, and a tactician. When Prof. J. A. Ewing, the Director of British Naval Education, visited this country last October, he made a special study of this question, and in an official report has declared that the amalgamation scheme was successful, citing as its most enthusiastic adherent "Bob" Evans. It would seem as if the *Bennington's* accident should now furnish a reason for getting at the real facts by means of a commission of naval and civilian experts.

Meanwhile it behooves us to examine carefully into the engineering system which has prevailed in the navy since the passage of the act of 1899 amalgamating the engineer officers, who had

existed separately from the first introduction of steam in the navy, with the line officers, whose sole duties up to that time had pertained to the navigating and fighting of their vessels. A desire on the part of the engineers for rank and command was largely responsible for the change—the root of the trouble being really social. The engineer officer felt that, although a graduate of Annapolis and a gentleman, he was ranked with locomotive engineers and the men who run dynamos. He was aggrieved that his title suggested an oil-can and overalls, while his classmate walked the deck in natty uniform and absorbed pretty nearly all the praise and glory.

This friction between the line and staff might have been still going on had it not been that the powerful aid of Theodore Roosevelt was invoked, with the result that the engineers were abolished and transferred to the line in 1899. From that time on, the obnoxious titles disappeared, and there was nothing in his rank or title to show whether Ensign Smith was a watch or division officer, or spent his time in the engine-room. But it was not long before Rear-Admiral Melville and others began to worry and to doubt whether the American naval officer could be made an all-around genius, or at least an expert in ordnance construction, in gunnery, in torpedoes, in navigation, in infantry tactics when on shore, and finally a master of the art of steam engineering. It was soon noted that this radical departure was not imitated in foreign navies, and that the mercantile fleets of the world had no thought of amalgamating their navigating officers and engine-room personnel because of the Washington experiment. Moreover, it speedily became apparent that the newly created class of warrant machinists, that is, the engine-room non-commissioned officers, was assuming the burdens laid down by the trained engineer officers. They were required to furnish, on sea pay of from $1,200 to $1,800, the technical information and practical experience needed to run the engines, while the commissioned officers assigned to engine-room duty "bossed the job." It next developed that good warrant machinists were very hard to obtain; they preferred civil positions to the restrictions of the navy, and this is particularly true of the torpedo-boat service. Meanwhile, in the six years since the passage of the act, the number of trained engineers has sunk from 181 to about 120, and, of these, 57 are permanently assigned to engineer duty on shore only.

It is true that some effort has been made to remedy these conditions, notably by planning a post-graduate engineering school and by selecting certain young officers to specialize in engineering questions precisely as others are detailed to specialize in ordnance questions. It is arranged, also, that when certain men of engineering aptitude have rearched the grade of lieutenant-commander they shall be assigned to permanent engineering duty. But what is this but an effort to train engineers like those amalgamated, without giving them the obnoxious titles?

In the *Bennington's* blowing up while at anchor, we see several results of the system, to which we would call especial attention. When this vessel was at sea in 1897—two years before the line and engineer amalgamation—she carried two trained engineer officers, Chief Engineer John K. Barton and Assistant Engineer Emory Winship. The former had then had twenty-three years of active service subsequent to his graduation as a cadet engineer in 1874; his assistant, Mr. Winship, had been only a year out of Annapolis. But when the *Bennington* blew up on Friday, the officer in entire charge of the engines was Ensign Charles T. Wade, who was graduated from Annapolis in 1902, just three years ago. Since he went to sea in 1900 he has served on the *Wompatuck*, a tug; the *Manila*, a station ship; the *Yorktown*, a sister ship of the *Bennington*, and, since December last, on the latter vessel. We do not know if Ensign Wade had been only on engineering duty since 1900, or whether he has been a line officer part of that time. But if the former is the case, and if it should appear that he is the smartest officer out of Annapolis in years, we still cannot understand why a youth not yet twenty-six years of age should carry the responsibility given in 1897 to two officers, one of whom had had twenty-six years of engineering duty and who was then forty-four years old. To make the matter worse, there appears to have been no warrant machinist on the *Bennington*, but only machinist mates, who are paid from $40 to $70 a month. Secretary Bonaparte himself ought to find out why the *Bennington's* engines were in charge of an ensign of twenty-six. If the Personnel law is at fault, it cannot be repealed too soon; it will have cost sufficient lives in all conscience. And if, as seems to us, the wise step is to return to the good old methods of the merchant marine, why, let us all set about inventing titles for our engineer officers which will satisfy them—and their wives. We would suggest the simple English designation of Staff Captain, Staff Commander, and Staff Lieutenant, if an engineer must be made to smell sweeter by another name.

NAVY PROMOTIONS.

At just what age an American naval officer should attain the rank commensurate with the command of a battleship or a fleet, is a question which never ceases to agitate naval circles. The recent Japanese victories have started the discussion anew. The Mikado's battleship and cruiser commanders, it appears, are, either by accident or design, in the early forties. Hence the all-important lesson of the campaign in the East is that we must have younger and more aggressive captains, carefully selected among their comrades because of their preëminent abilities and virtues. At least, this is the opinion of the navy maniacs who see our liberties lost if we do not have exactly their number of battleships, with crews and officers as ready to go into action as Togo's men when Rozhestvensky's fleet came in sight.

Paul Morton, typifying in himself the man who rises quickly to important executive positions in civil life, was deeply impressed by this argument. He dwelt with horror in his last report upon the fact that, while our battleship captains average fifty-seven years, in the German and English navies the average is forty-eight years, and in the Japanese fleet forty-five and three-quarters years. Of course, Mr. Morton did not take the trouble to point out that both the German and Japanese navies are recent creations, in which promotion has been very rapid by reason of sudden expansion, and that these conditions are in considerable measure of a temporary character. In the British fleet a determined effort is made to have young captains, which is rendered somewhat easy because many men of means and title enter the service and resign after some years, and there is no public objection to carrying on half pay a large number of men in perfect physical and mental health in order that their juniors may be pushed ahead. In the American navy the resignation of any line officer above the rank of lieutenant is practically unheard of, and the men who have private means are remarkably few in number. Hence retirements for age (sixty-two years) or for physical disability were practically the only means of creating vacancies in the upper grades until, under the Roosevelt Personnel law, a certain number of retirements of healthy and vigorous men was authorized in order to bring about additional promotions.

But even this does not suit the men who, like the present Chief of the Bureau of Navigation, foresee an even greater age in officers obtaining command rank, owing to the delayed promotion of the lieutenants and lieutenant-commanders who were badly blocked during the years from 1870 to 1900. Rear-Admiral Converse would compulsorily retire within a few years all commanders at fifty, and all captains at fifty-five; but neither he nor any other officer shows the slightest regard for the taxpayer's pocket in discussing this matter, or stops to inquire whether the example already set of retiring capable men to make way for their juniors is not a per-

nicious example likely to be followed in the army and the civil service. But, waiving all Treasury considerations, is it really established that an officer, to be a good commander of men, must be a captain by forty-five or fifty?

Writing on this whole question in the *Proceedings of the Naval Institute*, Lieut. R. H. Jackson affirms that we have to-day excellent flag officers at fifty-seven and fifty-eight. If we look back into our naval history we find, of course, some dashing young heroes of the Cushing and Flusser type. But Farragut was sixty when the Civil War broke out; Porter was fifty when he ran the Vicksburg batteries; Dupont was sixty when he attacked Charleston, and Goldsborough fifty-seven when he took Roanoke; and we are of the opinion that they did their work in a pretty satisfactory manner. John A. Winslow sank the *Alabama* when fifty-three. Coming to more recent events, the people of this country were pretty well satisfied with Dewey's and Sampson's captains at Manila and Santiago, and with these officers themselves. Yet Dewey was sixty-one and Sampson fifty-eight. Of their captains, Gridley was fifty-three, Lamberton fifty-five, Wildes fifty-five, Chadwick fifty-four, Coghlan fifty-four, Clark fifty-five, Philip fifty-eight, Cook fifty-five, Evans fifty-two, Taylor fifty-three, and Higginson fifty-five. Now, not one of these men broke down physically during their long service in the tropics, and every one did his duty well. Yet if the modern theory had prevailed prior to 1898, most of them would have been on the retired list, or they would all of them have been rear-admirals, and, therefore, only one or two would have taken part in the actual fighting. Moreover, the greatest advantage of having these men as commanders would have been lost—namely, their previous war service, every one of them having taken part in the Civil War and being therefore a veteran.

This showing of itself, it seems to us, exposes the alarmists who would adopt with naval officers the policy of churches with ministers who have reached the "dead line" of fifty. So far as the theory of promotion by selection is concerned, we are glad to see signs of a revulsion of feeling against this pet doctrine of President Roosevelt, just as there is a similar reaction in the army against a proposal fraught with grave danger to both services. Thus, Capt. E. B. Barry, Lieut.-Commander W. I. Chambers, Lieuts. R. H. Jackson, I. H. Gillis, and H. O. Stickney have all come out against it in the last *Proceedings of the Naval Institute*. Nothing else was to have been expected; in a republic like this it will be impossible to bar out political or other influences if men are to be advanced for special reasons. The real remedy is the weeding out of the lazy, the indifferent, or the worthless.

Promotion by seniority, it must not be forgotten, worked well in 1861 and 1898, when selection was undreamed of. Moreover, no lawmakers or naval theorists can ever fix the age when any given man is at the height of his powers, mentally and physically, or when the falling off begins. Nobody attempts this in civil life, where some of the responsibilities are fully as great as those of a battleship captain. One man will do his best work at forty, while his classmate does not ripen fully until fifty, and some men, like Abram S. Hewitt, have performed splendid service after seventy. Finally, a naval officer is particularly in need of wisdom and judgment. Human experience teaches that the best counsellors of nations have not been tossed aside arbitrarily at fifty-seven or sixty-two.

THE SHIPPING TRUST.

Annual reports of the International Mercantile Marine Company—more familiarly known as the "Shipping Trust"—have from the first attracted special attention because of the remarkable circumstances in which that company had its origin. The undertaking may be fairly described as the climax of the wild promoting craze of 1901. Two principles seemed at that time to have been definitely accepted in certain financial quarters: one, that the virtue of mere combination of rival companies was such as to warrant any recapitalization which should bring it about; the other, that a new era in finance had opened, which rendered needless any attention to the teachings of history. The Shipping Trust was projected with a view to raising money enough to buy up the transatlantic mercantile marine at whatever price its owners should demand. Starting with such a plan, and with the American public seemingly eager to lay boundless sums of capital at the most daring promoter's feet, it is not strange that the purchase was effected. A period of unusual prosperity in the trade was drawing to an end; the foreign owners of the White Star, Leyland, and Dominion Lines were perfectly well aware that the end was near. Europe's industrial "boom," which had crowded the ships with freight, was already collapsing; the Boer war, which had drawn heavily on competing tonnage to provide for army needs, could not continue more than a few months longer. At just this juncture came the American syndicate with bids so extravagant that the foreign owners were literally staggered. They sold, on their own terms, mostly for cash; the two American companies were acquired through exchange of their own shares for the stock of the Shipping Trust; $100,000,000 stock and $50,000,000 bonds were marketed through a syndicate with the life-insurance affiliation usual in those days, and the "deal" went through.

This is history; now for the sequel. The Mercantile Marine report for the calendar year 1903, published last July, showed $355,000 earned over and above the interest on outstanding bonds. On July 18 the statement for 1904 was issued, and showed that earnings failed by $2,039,150 to meet fixed charges. It is undoubtedly true that last year was a peculiarly trying period in the ocean trade. It was so, however, for reasons which might have been readily foreseen in 1901, and which doubtless were foreseen by the English owners who sold out to the Shipping Trust. No monopoly is possible, or ever was, in the ocean highway; and at the very time when the outlook for new business was growing doubtful, a wholly unprecedented volume of new shipping was being poured out from the yards. What has happened would have been inevitable even without such contributory incidents as the decline in this country's wheat export trade these past two years. Other seasons will undoubtedly ensue more favorable to profits on transatlantic lines; but they will serve as slight apology for the extraordinary promotion scheme of four years ago. The only reassuring fact about this experiment, as about others which came to grief in 1903, is that the Trust's discredited securities point the moral of 1901 so plainly that it will be a good many years before such projects will again get a hearing with the investing public.

President Ismay's comment on the year's results draws attention to some peculiar influences in the ocean trade conditions of the period which ought to be fairly weighed. Whether they do or do not throw a more roseate light on the future of this combination, whose $100,000,000 stock has never earned anything, and which failed by $2,000,000 last year to earn the $3,800,000 annual interest on its bonds, a study of the causes of this remarkable showing ought at least to clear up the question of an ocean steamship Trust. The truth is that the American combination, which tried, by brute force of money, to dominate rates and traffic on the transatlantic highway, has thus far served only to intensify competition. The Cunard Company, which refused to join the combination, at once became an aggressive rival; it was sustained by the British Government, which naturally favored the one large line that remained available as a naval reserve when the international Trust absorbed the others. But this was the least of the new combination's worries. It was confronted, even before its incorporation, by the competition of the compactly capitalized German lines—a serious source of danger to an enterprise loaded down in the beginning with a mountain of watered stock.

The Mercantile Marine started out by paying tribute to these German companies. An absurdly one-sided agreement between them and the Trust was made, which kept the Trust's boats out of German ports while only nominally restricting the German lines. A very similar contract made the syndicate pay to the German lines a 6 per cent. subsidy on one-fourth of their stock, while in return the German companies were to pay to the Trust one-fourth of whatever dividends were declared on their own stock. If the German lines paid no dividends, the Mercantile Marine got nothing; but the Germans still got their 6 per cent. subsidy. This extraordinary arrangement was explained in the contract as planned "to enable each of the contracting parties to have a direct interest in the business of the other." One detects a faint aroma of the lately much-celebrated railway "community-of-interest." It was part of the hodge-podge economic theory of the day. As a matter of fact, the German lines always paid less to the Trust, on this altruistic contract, than the Trust paid to them. But this was not all. A year ago these same German allies undertook to drive the Cunard Company out of a long-established business of soliciting immigrants to America through agents on the Continent. A rate war ensued; third-class Atlantic rates came down from $27.50 to $10; as Mr. Ismay remarks, this left the Mercantile Marine "no alternative but to make corresponding reductions in rates to maintain its position in the trade." So the matter stands to-day; the result having been the fall of the combination's net receipts for 1904 to 45 per cent. even of the previous year's poor showing, and to 30 per cent. of the figure confidently predicted at the time when the Trust was floated.

The question naturally arises, is this collapse of profits in 1904 a passing incident, or does it argue permanent danger to the enterprise? In either case, why were such possibilities overlooked when the security-manufacturers of 1902 took the ill-fated project in hand? To the second question we know of no answer save the overpowering financial delusion of that day. The first and foremost proposition was to sell the stock of such undertakings; how this was done, with "underwriting syndicates," with a prior claim on the vast accumulations of insurance policyholders, and with a fit of temporary madness on the part of the investing public, every one knows. Only two considerations were then alleged which appealed, even for an hour, to intelligent minds. One was the chance of a huge subsidy gift by the United States Government; the other, a vague and intangible idea that somehow, when the "magnates" controlling the Mercantile Marine should also control all the railways running inland from the coast, such mutual arrangements could be made between land and water lines as to shut out rival ocean carriers from effective competition.

Both these arguments very shortly turned out to be completely hollow. If the Subsidy bill, so ardently pressed by the Trust's foremost agent, Senator Hanna, had ever had any possibility of enactment, that possibility vanished when appeal for it meant, not assistance to a struggling industry, but a gift of public funds to an enormously wealthy Trust, for the sole purpose of enabling it to pay dividends on watered stock. From so monstrous a proposition, even the former supporters of subsidies naturally shrank. And the theory of a joint monopoly of land and sea transportation lines has been shattered even more effectually. There are competing transcontinental lines as there were before the days of "community-of-interest" and "holding companies," and their competition is possibly more bitter now than it was then. One can imagine what would happen on the land if a single group of these railways were to attempt an exclusive offensive and defensive alliance with the ships of the Mercantile Marine. Of what would happen on the sea, this year's experience of the Shipping Trust gives a sufficiently plain hint. We suspect that there remains, for that huge water-logged combination, simply the recourse usually left for companies which have misused the money market and over-capitalized delusive hopes. Its business will have to be managed on exactly the lines employed before the promoters laid their hands on the constituent companies. As to its capital, the officers may as well make public confession of the blunders of 1902, and set to work reorganizing.

SAINTE-BEUVE'S CORRESPONDENCE WITH THE OLIVIERS.

PARIS, July 12, 1905.

The inedited correspondence of Sainte-Beuve with M. and Madame Olivier has just been published, with an introduction and notes by M. Léon Séché. Much interest is necessarily attached to all that concerns Sainte-Beuve; his reputation as a critic is not on the wane, but increases every day; his 'Causeries' will remain one of those books which can be read over and over again; they are a real monument of the literature of the nineteenth century. His judgment on every subject of which he treats may be considered definitive.

It was well known to all the friends of Sainte-Beuve that the Juste Oliviers played a considerable part in his life, and that he was in very intimate relations with them from 1837, the date of his first journey to Switzerland, to 1869, the date of his death. For family reasons, the Oliviers always refused to publish the letters which they had received from him. They only allowed M. Jules Troubat, Sainte-Beuve's secretary, to use some of them in 1876. Who were the Oliviers? Olivier was born October 18, 1807, at Eysins, a small village in the canton of Vaud. He was of French origin; his family had settled in Switzerland during the wars of religion. His parents were peasants, but educated peasants, who gave him a good education. He showed at an early age much disposition for literature and poetry. He came to Paris during the Romantic period, and made there the acquaintance of Alfred de Vigny, Alfred de Musset, and Sainte-Beuve. He relates in his journal:

"Encouraged by the friendly reception of certain men of letters to whom I had been recommended, I resolved to triumph over my timidity and pay a visit to Sainte-Beuve. I arrive at No. 19 in the Rue Notre-Dame-des-Champs. I ask for M. Sainte-Beuve. An old lady [his mother] appears at a window, and, after some objections, she screams: 'Sainte-Beuve, are you in?' I see a face behind a litle window. The staircase is shown to me. I knock; a young man opens—it is Sainte-Beuve. I tell him that I came by the advice of a journalist, whom I name. This recommendation was not very powerful. 'C'est un très bon garçon,' answered he. . . . The conversation turned on the literary questions of the day, and afterwards on Geneva and the Genevese, of whom Sainte-Beuve had known several. M. Sainte-Beuve does not always end his phrases; he throws them about and does not seem to care for them to the close. This gives his conversation a jerky character. . . . As for his exterior, I will add that he is of middle size and that his face is not very regular. His pale, round head is almost too big for his body. His nose is large and ill made; his eyes lucid; . . . his hair reddish and very abundant. . . . In short, Sainte-Beuve is not handsome, not even passable. However, his face has nothing disagreeable about it, and even ends by pleasing."

After the Revolution of 1830, Olivier returned to Switzerland, where he became professor of history at the Academy of Lausanne. He addressed to Sainte-Beuve in 1835 a volume of poems, 'Les Deux Voix,' with a letter in which he invited him to make him a visit. We have Sainte-Beuve's answer to this amiable offer. Juste Olivier was already married to a very distinguished person, Caroline Ruchet, who belonged to one of the best families of Vaud, and who had been his collaborator; she had had a hand in the publication of 'Les Deux Voix.' Two years afterwards, Sainte-Beuve accomplished his project of visiting the Oliviers. He had a double reason for leaving Paris: it was the time of his rupture with Victor Hugo, of which the causes are well known, and, his mind having turned to a new channel, he was meditating a long study of Port Royal and the Port Royalists. Switzerland was a not inappropriate place for severe study, as well as a suitable asylum for one who had gone through a dangerous moral crisis.

Sainte-Beuve remained some time at Aigle, as the guest of the Oliviers. He prepared there the first outlines of the lectures which he proposed to give on Port Royal. He had long been collecting documents of all sorts for the work. There was some difficulty in obtaining for this subject the approbation of the Council of State and of the Academic Council; there was always a little jealousy of foreign lecturers, and the subject seemed rather special. The lectures lasted six months, during all of which time Sainte-Beuve remained the guest of his friends. He found with them what he had never had—a home, and the pleasures of domestic life. Madame Olivier was no ordinary woman: she was handsome; she was

a person of character; she had received from nature, Sainte-Beuve once said, the organization of a Roman. Doudan, who was a good judge and whose correspondence is so charming, loved in her a mixture of candid simplicity and great superiority of mind.

In 1843, Olivier bought the *Revue Suisse* and asked Sainte-Beuve to send him Parisian *chroniques;* and the offer was accepted on condition that these chronicles should not be signed. Sainte-Beuve called them his poisons. "It is quite true," says the editor, "that they bear the trace of his little jealousies and of his little dislikes. He used his wit chiefly against his former Romantic friends, against Victor Hugo and Vigny." These anonymous chronicles add nothing to the reputation of Sainte-Beuve, but sometimes explain enigmas. Sainte-Beuve was, in fact, a very mixed character; it is difficult to imagine that the author of the verses which he wrote at the time of his passion for Madame Victor Hugo was the same man who wrote the admirable volumes on Port Royal. The collaboration of Sainte-Beuve with the *Revue Suisse* lasted three years—as long as Olivier directed it. He was forced to abandon its control in 1845 after the revolution which took place in the Canton of Vaud, and went to Paris to settle there definitively. He undertook to conduct a boarding-school. Sainte-Beuve presented him to Marmier, to George Sand, to Madame Desbordes-Valmore, to Madame Récamier.

Juste Olivier seems to have been a marked victim of revolutions. That of 1848 was a great blow to him, and he thought for a moment of emigrating to the United States in company with Sainte-Beuve. He remained, however, in Paris, where a professorship was given him in a school of administration founded after 1848. In the meantime Sainte-Beuve went to Liège to give lectures on Chateaubriand, which were afterwards published in book form. Juste was what the Italians call an "infelice." The school of administration was suppressed; he had to give private lessons, and finally to work as a proofreader in the printing-office of one of his compatriots. Sainte-Beuve's relations with Olivier and his wife had suffered a change, which the former attributes to his great work, which "forbade all worldly or even friendly relations." Juste Olivier gives another version of the growing coldness. He intimates that Sainte-Beuve had changed all his views on religious matters. "He once exclaimed that I should have no more to do with Methodists [the Oliviers had very Methodistic ideas]"; and when his friend recalled to him so many fine religious pages in his 'Port Royal,' he said to him that it was all a play of his imagination. He added that he had never forfeited his freedom of mind. In fact, Oliver had ceased to be his "conscience"—such was the name he had once given him.

After a period of long coldness, they met at the funeral of Madame Desbordes-Valmore, their common friend. In a moment, the ice was broken. Sainte-Beuve took Olivier in his carriage, which followed the hearse, and said to him: "We will not revert to the past, but we will again be like the fingers of a hand." Two years before his death, October 21, 1867, Sainte-Beuve sent to Olivier the last edition of his 'Port Royal,' with these words: "To whom can I better offer these volumes than to you, the prime author of the circumstances in which the work could be born?" This is also what gives a peculiar interest to the correspondence just published. It was through the Olivier household that Sainte-Beuve was drawn into the atmosphere of Methodism, of serious and pure Christianity, which was the essence of Jansenism. This Jansenist experience had a lasting influence on Sainte-Beuve; he did not always conform his conduct to the Jansenist ideal, but his intellect, which was of the highest order, always bore the effects of the teaching of the purest minds of the seventeenth century. The correspondence cannot be analyzed; all its charm is in its minuteness and, to a great extent, its looseness. I will therefore not even give extracts from it, and will simply recommend the reading of it to such of Sainte-Beuve's admirers as wish to be completely acquainted with his versatile mind and the development of his remarkable individuality.

Correspondence.

A LABOR ARMY FOR THE PANAMA CANAL.

To the Editor of The Nation:

Sir: The fact that disease is rife on the Isthmus of Panama is becoming generally known, and is evidently responsible for an increasing difficulty in securing competent clerical assistance and efficient labor in sufficient quantity. Unless prompt measures be taken, the work will suffer in the same manner as it did under the French. In spite of engineering incompetence and of gross misapplication of funds, the fact remains that the French company would have made an appreciable impression upon the Isthmus, in the form of work done, but for the insurmountable difficulties which it then experienced in maintaining an adequate force of laborers. The West Indies, Africa, and the Far East were drawn upon in vain. The mortality was so frightful that the efforts to suppress the truth did not prevent a knowledge of the terrible conditions existing on the Isthmus from reaching the commonest workmen in foreign lands, deterring them from risking their lives at Panama. It seems that conditions under American administration promise to be little, if any, better.

The negro is, more nearly than any other people in the world, racially indisposed to contract those diseases which most readily attack men engaged in hard labor in the tropics. Of other races only occasional individuals are immune; some cannot withstand tropical influences at all; while a fair proportion can render efficient service for a period, if under proper control as to food, drink, rest, and labor. Acclimatization is probably never accomplished. What we call acclimatization consists in an adaptation of habits to tropical conditions sufficient to maintain a fairly vigorous healthfulness, or the state in which resistance to maladies everywhere is greatest. It is largely a matter of white corpuscles. Malaria can be prevented; or, if contracted, can be cured, when not complicated with other diseases. Yellow fever to a certain extent is preventable, but there is a limit to the efficiency of measures of prevention under such circumstances as those attending the employment of a vast horde of ignorant and intractable laborers engaged in the work of excavation and construction in tropical swamps and jungles. Smallpox can be eliminated with comparative ease. But hepatitis, with its large train of concomitant ills, is the great tropical ogre, against which no prophylactic charms will completely and unerringly prevail. All northern races are predisposed to it in the tropics. Sooner or later, with rare exceptions, all men not of tropical ancestry will succumb to it. The only remedy is to leave, and to do so promptly. Seldom can a permanent cure be effected while the patient persists in tropical residence.

But by careful diet, careful avoidance of chill, ample rest, and abstention from every form of dissipation, the evil may be deferred. These are conditions requiring the direction of men of knowledge and experience, and, to be made effective, absolute obedience to prescribed regulations must be enforced. Persuasion will not accomplish it, and fear is not enough to prevent men taking the risk of infraction of hygienic laws. The only effective agent is military discipline, extended over laborers enlisted under oath of obedience to officers whose orders will touch every act of their lives. Our board of army surgeons is the proper group of Government officers for establishing a suitable system which would insure reasonable protection to the lives of those enlisted for such service. Under such a régime, the guarantee of at least partial immunity from the most aggravating predisposing causes of the worst tropical maladies would inspire confidence, and immensely facilitate the recruiting of efficient labor. It is relatively easy to determine by a medical examination whether a man is probably predisposed constitutionally to the great tropical disease, and unfit subjects could be rejected, thus lessening the future difficulties of hospital service, and forestalling a crippling of the working force in the field.

The building of an Isthmian Canal is of such importance to our nation that we cannot afford to go on in the steps of predecessors whose methods were demonstrated to be wrong, if better measures can be adopted. Every other problem connected with the piercing of the Isthmus sinks into insignificance beside this of providing a sufficiency of brawn and muscle to drive and supplement the mechanical devices, which alone will not do the work. Men we must have, men in good physical and mental health, not afraid of death lurking in every shadow, not given over to dissipation through abandon, as so often happens in communities exposed to an ever-present danger from disease.

It may be an innovation to suggest enlisting laborers under a military system for digging a canal, but it is surely as rational to enlist an army to conquer a great route of commerce by sanely regulated industry as to enlist soldiers to do the work of national defence and to break down foreign walls and wills for national expansion.

SPECIAL ASSIZES FOR SPEEDY TRIAL OF A NEGRO.

To the Editor of The Nation:

Sir: A few weeks ago, in examining some papers in the Massachusetts Archives at the State House in Boston, I stumbled on a document which is of importance to those interested in the history of lynching in this country. As the document reached Dr. Cutler too late to be incorporated into his work on 'Lynch-Law,' reviewed in the *Nation* of yesterday, perhaps you will think it worth preserving in your columns. The document is dated August 26, 1734, and is taken from the Council Records, ix., 538:

"Forasmuch as London (a Negroe Man) is imprisoned in His Majtys Goal in Boston for a Rape committed on the Body of Sarah Clark, and the Time appointed by Law for Holding the Court of Assize and General Goal delivery for the County of Suffolk is at a great distance, and the keeping him till that time will occasion great charge and may hazard his Escape.

"Advised and Consented, that a precept be made out to the Justices of the said Court to hold a Special Court of Assize and General Goal delivery, for the Trial of the said London as soon as may be conveniently."

Albert Matthews.

Boston, July 20, 1905.

HOT BREAD.

To the Editor of The Nation:

Sir: The negro question may be settled, the results of the war may be forgotten, but there is one subject that will forever absolutely divide the North and the South—hot bread. You may travel up and down the whole of Europe, and never be asked to eat hot bread; you cannot find a hotel in the North where there is not good cold bread to be had, mostly French; but in the South, hot bread three times a day is still the universal form in which the cereal grains are consumed. It is purely a Southern invention; it may be considered the South's contribution to the foods of the civilized world, and no doubt it will be clung to as long as time endures. Even the border cities are faithful to it. A European who had to be careful of her digestion, looking for a *pension* in Washington, made inquiries, in a general way, as to the character of the table, and in every instance the answer began: "We have five kinds of hot bread for breakfast. . . ." In Baltimore you may find a fine hotel (the Stafford) where absolutely nothing but hot bread is to be had for breakfast, in spite of the fact that they get a delicious French bread later in the day. We are reminded of this subject in connection with an editorial on race suicide in a late number of the *Woman's Medical Journal* (Chicago). The writer mentions incidentally that the median age (that is, the age which exactly divides the population into halves), twenty-three for the whole country, is higher in the North Atlantic and Western States than in the South Atlantic and Southern States, and says: "This fact indicates that, with all the severity of Northern winters, followed by inclement springs, the climate at the North is more favorable to health than is that of the Southern States, with all their mildness." But it is seldom safe to conclude anything from statistics, and in this case it may well be questioned whether it is not hot bread that is responsible for the too early taking off of the population in the South.

P. Q. R.

THE NORDENSKJÖLDS.

To the Editor of The Nation:

Sir: A reviewer in the last number of the *Nation* refers to Dr. Otto Nordenskjöld, author of 'Antarctica' and leader of the Swedish Antarctic expedition, as "son of the late illustrious commander of the *Vega* expedition." He is his nephew. Prof. Adolf Nordenskjöld had two sons: Gustaf, who died in 1895, and Erland. Gustaf Nordenskjöld visited this country in 1891 and investigated the pueblo regions of Colorado; the results of his investigations were embodied in a volume entitled 'The Cliff Dwellers of Mesa Verde,' published in Stockholm in 1893. Erland Nordenskjöld has visited both South and Central America, and published several contributions to American archæology. Otto Nordenskjöld took part (as leader) in an expedition to the Straits of Magellan in 1895-1897, and has described the journey in a volume in Swedish entitled 'Fran Eldslandet,' as well as in a volume of scientific results: 'Wissenschaftliche Ergebnisse der Schwedischen Expedition nach den Magellansländern 1895-1897.' He also visited Klondyke a few years ago.

Chicago, July 17, 1905.

Notes.

A Life of Farragut, by John R. Spears, is next in order of the "American Crisis" series of George W. Jacobs & Co., Philadelphia.

On the first of May last began the initial year of the Paris Société des Textes Français, whose object is "to reprint texts published in the last four centuries, and to print for the first time inedited texts of the same period." The President is Prof. Gustave Lanson of the University of Paris. The annual subscription is ten francs, life payment two hundred francs; entitling members to the annual output. Accuracy is the prime aim, but with increased support criticism may be attempted. Those who wish to join should address the general secretary, M. Huguet, 30 rue Guilbert, Caen (Calvados). The treasurer is M. Roques, 4 Boulevard Saint-Germain, Paris.

In Dr. Thwaites's series of reprints, 'Early Western Travels, 1748-1846' (Cleveland: The Arthur H. Clark Co.), James's 'Account of an Expedition from Pittsburgh to the Rocky Mountains'—commonly known as Long's, from the commander, an appointee of Calhoun's when Secretary of War—has just reached its conclusion in a fourth volume. This is a very animated and well-written narrative, and an authoritative source of information about the Indian tribes encountered on the journey.

Since we last reported on the handy "Biographical Edition" of R. L. Stevenson's Writings, a dozen volumes have been added to the previous total. The typography is clear, and each work has a brief introduction from Stevenson's widow.

Taine's 'Voyage aux Pyrénées,' Balzac's 'Une Ténébreuse Affaire,' and De la Landelle's 'Une Haine à Bord' are among recent numbers of the "Oxford Modern French Series" issued by the Clarendon Press (New York: H. Frowde). These, as we have before had occasion to remark, are unpretentious yet not unattractive volumes.

Misses Porter and Clarke's commendable reissue of the Shakspere First Folio (T. Y. Crowell & Co.), with reinforcement of notes, introduction, glossary, variorum readings, and selected criticism, proceeds with "Hamlet." This makes a compact little volume of 339 pages, and we do not wonder that the growth of material has led the publishers to raise the price hereafter, which is still moderate.

Mr. James Bryce's 'Studies in History and Jurisprudence,' published four years ago, has been made a subject of excerpt for a thin volume on 'Marriage and Divorce' and a thicker (pp. 341) on 'Constitutions' (New York: Henry Frowde). The six essays of the latter collection embrace the discussion of Flexible and Rigid Constitutions, the Action of Centripetal and Centrifugal Forces on Political Constitutions, and the concrete examples of Primitive Iceland, the United States Constitution as Seen in the Past, Two South African Constitutions, and the Constitution of the Commonwealth of Australia. It need not be said that this group contains highly profitable reading, even in the chapters which are now purely historical. That on Australia foresees the importance of the labor questions without picturing such an approach to domination as we are now witnessing, with results strikingly set forth last week by our correspondent at Sydney. We are sure that the American public which will appreciate these volumes would have preferred a more elegant make, American though it be.

Farmer and Henley's 'Slang and its Analogues,' filling seven volumes, has been usefully abridged to one, 'A Dictionary of Slang and Colloquial English' (London: Routledge; New York: Dutton). Whether anything has been added or not is not stated; the latest date of reference that we have observed is 1884, but Kaffir, in the sense of mining share, appears. Jingo is of course here; and leading political Americanisms like Barnburner, Carpet-bagger, Gerrymander (with careful noting of the hard *g*). Granger, and Mugwump, with Molly Maguires, are to be found correctly defined. We miss the Canadian legislative term of postponement of a measure, Hoist. The curious will find under Screwed two columns of synonyms for "drunk," besides those under other designated heads. The printer's work has been well done.

Comparatively few remain of those who in childhood were delighted by the early editions of Harriet Martineau's tales for children—'The Crofton Boys,' 'Settlers at Home,' 'Feats on the Fiord.' Such, and we hope many of the rising generation, will welcome a charming edition of the last-named, lately, by Dent & Co., added to their series of "Temple Classics for Young People." It is beautifully illustrated. We trust the favor it will meet with will induce the publishers to complete the series of Miss Martineau's tales in the same form.

The *Archæologia*—the tracts of the London Antiquaries (Burlington House)—are justly styled miscellaneous. The last number (Second Series, vol. ix.) contains matter to suit most lovers of antiquity. The classical historian cannot fail to be interested in the excavations at Caerwent (Monmouth-

shire), the Romano-British Venta Silurum, or in the discovery on the site of Newgate of yet another portion of the Roman Wall of London. The lover of architecture for itself will find more to attract him in Mr. Hill's paper on "Some Post-Visigothic Churches in Spain," or in that of Mr. St. John Hope on the west front of Wells Cathedral. The virtuoso will be glad to read what Mr. Waller has to tell him of the "Hauberk of Chain Mail" and its conventional representations, or, still more fascinating, Mr. Dalton's account of one of the treasures of the British Museum, the famous Crystal of Lothair, with its scenes from the story of Susannah and its inscription, in somewhat doubtful Latin, "Lotharius rex Francorum fieri jussit." Last but not least, the student of mediæval manners and customs or of the development of trade and commerce, not to mention the lawyer and pedigree-hunter, will find valuable information in "Some Chancery Proceedings of the 15th Century" and the "Records of the Manor of Durringdon," by Mr. Trice Martin and Mr. Kirby.

It will doubtless be remembered by many readers of the *Nation* that the year 1904 was signalized by two exhibitions of Sienese art —the one in Siena itself, the other in London, under the auspices of the Burlington Fine Arts Club. In connection with these, a valuable book has just been published by the Commissione Senese di Storia Patria, under the title of 'Arte Antica Senese,' in two volumes, consisting of an aggregate of nearly 500 pages, and containing more than 180 excellent illustrations, many of which it is quite impossible to obtain elsewhere (Siena: L. Lazzeri). To students of mediæval Siena the names of the writers of the various articles are of themselves a sufficient guarantee of the uniform excellence of the work; while the list of the contents will show the extent of the ground which has been covered. It is, in fact, a book which no one who is interested in Sienese art, in any of its branches, can afford to do without. The respective section titles are: The Architecture of Mediæval Siena and of her Ancient Territory, by A. Canestrelli; The First Master of Sodoma, by R. H. Hobart Cust; Sano di Pietro and Messer Cione di Ravi, Count of Lattaia, by L. Zdekauer; The Works of Two Old Sienese Painters at Borgo Sansepolero, by E. Franceschi-Martini; Simone Martini and Petrarch, by P. Rossi; The Art of the Wood-Carvers in Siena, before the Statute of 1426, by V. Lusini; Giovanni da Siena, by C. Ricci; The Communal Palace of Siena, by F. Donati; Sienese Art at Pisa, by F. Lupi; The Monte dei Paschi, and the Works of Art therein Contained, by N. Mengozzi; The Cathedral of Massa Marittima—The High Altar, the Work of the Sienese Flaminio del Turco, by L. Petrocchi; and The Goldsmiths of Siena and their Works, by A. Lisini.

The learned librarian of the Arnamagnæan collection of manuscripts in the University Library of Copenhagen has just finished the "Palæographic Atlas" of whose beginnings we had occasion to make mention a year or two ago. The Commissioners of the Arnamagnæan Fund issued the first (Danish) section in 1903, and the second (Old Norwegian-Icelandic) now makes its appearance. Together with the catalogue of the manuscripts contained in the Arnamagnæan collection (published in 1894), and that of the Old Norwegian-Icelandic manuscripts in the Great Royal Library of Copenhagen, etc. (published in 1900), these two volumes of reproductions aggregate an apparatus for the study of ancient Scandinavian booklore and chirography of which any nation, literature, or author might well be proud. The size of the present volume corresponds closely with that of the former—37 folio phototype plates—and there are reproductions of 53 manuscripts and documents. We have here renderings of the most famous treasures of Old Norwegian-Icelandic literature, such as the 'Grágas,' the fragment of 'Kringla' (the chief manuscript of Snorri's Lives of the Norwegian Kings), the Codex Regius of Saemund's Edda, Odd's Olaf's Saga, 'Fagrskinna,' King's Mirror, 'Laxdoela,' 'Njála,' etc. Owing to the richness of the extant material, it was impossible to embrace in this volume such a span of time as is covered by the Danish section; it ranges from about 1150 to 1300. The editor has prefixed a brief but interesting introduction dealing with the origin and development of the art of writing (in Latin characters) and spelling in Iceland and Norway, a subject which can now be studied at first hand and in chronological sequence. The Carlsberg Fund, a Danish institution somewhat similar to the Carnegie Institute here, has generously promised the editor to defray the expenses of an additional Old-Norwegian-Icelandic section carrying the work down to the fifteenth century.

The English Garden City Association, whose efforts are directed against overcrowding in large cities and the consequent depopulation of the rural districts, have good cause to congratulate themselves on the progress of their scheme. It consists in the developing of new industrial and residential towns surrounded by belts of agricultural land; the unearned increment being retained in each case for the benefit of the inhabitants after payment of 5 per cent. per annum on the capital. The first step towards practical realization was taken, in 1903, when a joint-stock company (The Garden City Pioneer Company, Limited) was started with a capital of £3,000 000 to develop an estate of 3,850 acres situated between Hitchin and Baldock. During the last two years, building, road-making, and other operations have been carried on with vigor, applications for small holdings and for residential and factory sites have come in with greater and greater frequency, and there is reason to think that, before the close of 1905, the first Garden City will have risen on what a short time back were only the open fields of Letchworth. The exhibition of Cheap Cottages, which is to be held on the estate from the end of July till October, may be counted on to add to the popularity of the undertaking, and to increase still further the demand for sites.

Still another movement for the promotion of physical education in England is a memorial addressed to the Government by the Anthropological Institute, and signed also by Lords Roberts and Avebury, Sir William Ramsay, and many headmasters, praying that an anthropometric survey, a register of sickness, and an advisory committee may be established without delay. Should these measures be adopted it will be known with certainty whether the physique of the population at large is improving or deteriorating. It will also be possible, by comparison of the physique with the environment, to ascertain the influences which are bringing about the changes of physique. The data supplied by the survey will enable the advisory committee, consisting of experts and representatives of Government departments, to arrive at conclusions on which important legislative action can be founded.

Lord Cromer, at a dinner recently given in his honor in London, said that he believed four conditions were essential to the uniform and steady progress of Egypt. The first was that they should not be in a hurry; the second, that Egyptian affairs should be kept out of the dangerous swirl of British party politics. His third condition was that, while every reasonable occasion should be taken to profit by any real aptitude the Egyptians might show for managing their own affairs, great care should be observed in urging Western ideas on the country before the people were ripe to assimilate such ideas. The fourth and last of his conditions was that Egypt should continue to be governed in the interest of the Egyptians themselves. Our administrators of the Philippines would do well to consider carefully this lucid statement of the most experienced and successful of Western rulers over an Eastern people.

Evidently a reaction is setting in among German educators against the tendency, so pronounced during the past ten years, to ease up the work in the secondary schools on the plea that it is too heavy. Repeatedly the Emperor himself has in a very positive way exerted his influence in favor of this tendency. Recently voices of weight, coming from the schools themselves, affirm that this policy does injustice to the gifted pupils; and now a programme has been formally launched, calling for separate schools, "élite schools," for "talented" pupils. The most pronounced supporter of this demand is Dr. J. Petzoldt of the gymnasium at Spandau, in a brochure entitled 'Sonderschulen für hervorragend Befähigte.' From a psychological and pedagogical standpoint, he shows the harm done to the brighter students by compelling them to follow a course that is gauged for the abilities of the mediocre, and tries to prove that a gifted boy could finish the regular course of a full secondary school in six instead of nine years, and thus possibly enter the university at the early age of fifteen or sixteen. The brochure even gives practical hints as to the way in which these special schools are to be conducted. Prof. Bruno Meyer of Berlin, also an educator, discusses this project in detail in a series of articles that have appeared in the scientific *Beilage* of the Munich *Allgemeine Zeitung* (Nos. 141-142). In his estimation, the plan is not so bad, but will meet with great difficulties in being realized. One of the most serious he finds to be securing the proper teaching corps for such special schools; but he believes the problem is permanently raised, and must be worked out by educators. He closes with the question, Who will make the first experiment in this direction?

Many expeditions to observe the coming total eclipse of the sun on August 30 are about setting out, or have already gone. The Lick Observatory has dispatched three parties. The first, at the beginning of the

track, will establish itself in Labrador; the second in Spain; the third near Assuan, in Egypt. The Naval Observatory, likewise, has sent an eclipse contingent under Admiral Chester, United States Navy, Director. These likewise will divide, one company settling on the northern, another on the southern coast of Spain, while a third occupies Algeria. Harvard College Observatory, represented by Prof. W. H. Pickering, will establish its station in northern Africa, and Professor Todd of Amherst is about sailing for Naples, and ultimately Tripoli in Barbary, whence he hopes for as clear a view of the corona as he was favored with at the same place in May, 1900. Canadian observers from Ottawa and Toronto are en route for the coast and the interior of Labrador.

—In the June number of the *North American Review*, Mr. Frederick C. Penfield, contrasting with much acumen the realized Canal of Suez and that projected at Panama, points out, what all but the wilfully blinded have always perceived, that the latter cannot be expected to make an adequate return on the huge, unknown, and unknowable investment, or, as he phrases it, "to pay directly." To make it pay indirectly, he suggests "the development of a mighty commercial marine that will carry American products to foreign markets, and to new markets, *under the Stars and Stripes*" (the italics are ours). If the passage tonnage is large enough, it would seem that a canal open on equal terms to ships of all nations might be supremely indifferent to the color of the flag those ships carry, but such an obvious inference is lost on the protectionist mind, which finds salvation only in Government assistance. The promoters of an unremunerative Government-built Panama Canal will naturally ally themselves with the shouters for a ship subsidy, and the Frye bill or some similar measure will doubtless be urged with renewed vigor at the next session of Congress. Is it not in order to ask the fundamental question, Of what value will a large mercantile marine prove to the average American? To the capitalist who reaps the benefit of a steamer service of which the margin between profit and loss is covered by a substantial grant of public funds, such a marine needs neither apology nor argument, but what of the workingman? What opportunity does it hold out to him? The fact is, that the sailor's life is one of hardship, exposure, poor food, scanty pay, with practically no ultimate reward. Home life is not for him; he earns low wages, and he toils all his days only to end them too often as the recipient of public charity. Even if he reaches the dignity of captain, he gets, as a rule, less in salary than a good mechanic. There are, of course, exceptions, but they are very few in number. Any doubt as to what the seafaring man may ordinarily expect as the crown of his life's labor will be dispelled by a visit to Sailors' Snug Harbor on Staten Island, where may be found only too many worthy men once proud commanders of clipper ships and now beneficiaries of kind Capt. Randall's wise and noble bequest, without which they would doubtless have to meet their fate in some county almshouse.

—Is there not a moral and a humanitarian side to this movement in favor of a mighty commercial marine "under the American flag"? Why induce boys to adopt a livelihood wherein the prizes are so few and the deprivations so many, when employment on shore holds out to the industrious the certainty of good wages, the benefits and pleasures of home, the possibility of great achievement in life and of honorable and useful distinction? When Carnegies, Vanderbilts, and Rockefellers (to use only the most sordid standard in illustration) are produced on blue water, then it will be time to wish our sons to follow the sea, but until then is it not well to let the Swedes, Norwegians, Germans, British, and Italians dispute among themselves a field which it is not worth our American while to seek to occupy? If they are willing to carry our goods at rates too low for the maintenance of an American ship, why not let them do so and apply our savings in money and in men to the development of our own land and the bettering of those who people it?

—Dr. Bradley carries on to Matter the letter M of the Oxford English Dictionary in its July instalment (H. Frowde). For the first time in a long while, a little batch of "additions and emendations" is affixed to the preface that reviews the tract under survey; all but one of them relating to that tract. At the beginning stand the rubrics Mandragora and Mandrake, and it is a notable illustration of the way in which the classical literature has filtered down in our tongue (as in every other) that the quotations under both the above heads might serve very well as a *précis* of Mr. Charles Brewster Randolph's learned paper on "The Mandragora of the Ancients in Folk-Lore and Medicine," which one may turn to in volume 40 of the Proceedings of the American Academy of Arts and Sciences (January, 1905). Mandrake in the sense of 'May-apple' is an Americanism, and in this cosmopolitan section there are more American words than Celtic (but two of these in all). Mash and Masher are probably ours, but they have found ready acceptance in England, as has Materialize, both in the spiritistic sense and in the journalistic, to 'come off.' Rarely, says Dr. Bradley, is Manilla, attributively employed, as before cheroot, copal, hemp, etc., spelt with a single *l* (Dampier used but one in 1697); but we doubt if since 1898 the American usage has not been in conformity with the spelling of the name of the city. Proper names in such adjectival use abound as usual in this Dictionary: Marconi, with Marconigram, etc.; and Mr. H. G. Wells's Martian, for an up-to-date example, drawn from fiction. The "Man in the Moon," the invisible bursar in English election bribery, is here, together with the "Man of the World"; but we miss the "Man in the Street." Dickens contributes to the vocabulary the Marchioness. Whether one shall write Marquis or Marquess, frankly depends on the whim of the noble bearer of the name or the "style" of the journalistic proofroom. The female sex comes in for many opprobrious epithets, like Mankeen, the obsolete Mankind (in Fletcher, "a plaguy mankinde girle"), Mannish, and the like; and we find Maritality, correlative of Uxoriousness. Mascott, the luck-bringer, we derive from Audran's opera of December 29, 1880. Massage and its kindred formations date from 1876. There is interesting heraldic discourse under Martlet. Under Master we read: "The obscured pronunciation [*mister*] resulting from proclitic use doubtless began while the written form *master* was still commonly employed. Before the end of the seventeenth century, the abbreviation *Mr.* . . . had come to be restricted to the use in which the pronunciation was obscured, and to be the only permitted mode of writing the word in that use. Thenceforward *master* and *Mr.* were practically two words, distinct both in function and in form. In this Dictionary," concludes Dr. Bradley, "the abbreviation *Mr.*, in all its historical varieties of use, will be treated in its alphabetical place"—no doubt, with a cross-reference from Mister.

—Ralph D. Paine opens the August *Century* with a paper on American and English rowing, the first of a series on the "Spirit of School and College Sport." Any fair description of college rowing in the two countries must, of course, bring out a contrast not at all palatable to American college men who have held themselves above the victory-at-any-price spirit now dominant in American athletics; but sustained and severe public criticism is evidently the only path towards reform, and the *Century* is to be commended for lending its most conspicuous pages to the work. Manager Stone concludes his complacent papers on the Associated Press with an account of its service in recent wars, claiming for its agents a decided superiority over the numerous special correspondents sent out, whether in promptness in securing and transmitting important news or in the literary quality of their work. In the second of his papers on the Electric Railway, Frank J. Sprague gives a very vivid account of the construction and installation at Richmond, Va., of the first successful experiment in electric traction on a large scale, an experiment which entailed an immediate loss of $75,000 to Mr. Sprague's company, but proved highly profitable in the end, since it demonstrated the commercial feasibility of the system. It is hard to realize that this was less than twenty years ago. Mr. Sprague also describes his conception and working out of the "multiple unit" system, by which a train unit is made up of a number of individual cars, each complete in all respects and all capable of being operated simultaneously from any master switch on any car. Hugh Spender writes of Lady Warwick's experiment in giving practical agricultural education to English girls at Studley Castle. The graduates of her school have stood the supreme test of ability to drop at once into self-supporting positions in the special line for which they were fitted. Rudyard Kipling appears among the short-story writers—an event not quite so common in American magazines as it used to be.

—The American Library Association held its twenty-seventh annual meeting, July 4-8, in Portland, Oregon. As Mr. John Cotton Dana writes to us, it represented very broadly the whole country. The delegates who came by special train from the East, about 150 in number, were supplemented by other small parties from the Middle West and the South. The Pacific Coast itself gathered 150 more from widely scattered points in Washington, Oregon, and California. The group on the special

train during the seven full days of the journey became almost a library conference on wheels. The result of this naturally appeared in the meetings themselves, which not only were very well attended (in the general sessions, ranging from 250 to 400), but were marked by rapid transaction of important business and forcible discussion. The librarians of State libraries now have an independent organization. The presentation of amendments to the constitution of the American Library Association whereby independent bodies, of a kindred nature, may be affiliated to it, one of the most important events of the meeting, was the result of the wish of this body of State librarians to retain their independence while keeping in close touch with the parent body. This step marks the great advance which State libraries have made in recent years. They have, very generally, escaped from politics, have efficient officers, preserve carefully State documents and records, and enter into the public-library movement in their respective States. The public-library commissions of the several States will very possibly follow the State librarians in forming an independent body affiliated with the American Library Association. The league which they have founded for coöperative work contains good possibilities, especially in the publication of material of value to the small library. This again led to the natural request that they should be represented on the Publishing Board of the Association. Also very significant of the growth and broadening of the librarian's field was the vote authorizing the ex-presidents of the Association to form the American Library Institute, a body limited to 100 members, which shall meet once or twice each year solely for the discussion of the broader questions of librarianship. Such a body may hope to have a strong influence on such movements as that for international coöperation in bibliography in all its phases; a movement which a report read at the conference shows has not yet made any worthy progress. The papers and discussions at the several meetings were planned to cover the field of library work very generally, in the hope that they would thus be most useful to the varied activities represented (in most cases in their earlier states) by the libraries of the Pacific Coast. The evidence was abundant that the meetings themselves, and still more the zeal shown by the presence of 200 library workers from the East and Middle West, gave to the friends of libraries on the Coast all the interest and stimulus they had hoped for. The travellers visited Tacoma and Seattle as well as Portland, and found Western hospitality all that its reputation promised. Portland is of the best type of American city; substantial, not in undue haste to grow, and wearing already its few short years with much dignity. Little time was granted the delegates to view the Exposition, but a brief look at it approved it as charmingly picturesque, amply large for its purpose, and nowhere overstrained. If expositions are with this one to be withdrawn from the world for a time, then the exit is most gracefully made.

—In his very interesting preface to the 'American Bibliography,' Mr. Charles Evans speaks of the title-page of a book as corresponding to the face of a man, exhibiting characteristic features, which it is the bibliographer's function to reproduce faithfully. This function of a bibliographer is apparently not appreciated by Miss Nina E. Browne, who, in her 'Bibliography of Nathaniel Hawthorne' (Houghton, Mifflin & Co.), in no case offers an exact copy of a title-page, and seldom gives a title with even an approach to fulness. It has not been practicable, for the purpose of this note, to check up the various lists composing the volume before us with other bibliographies, or with any collection of Hawthorne books, but we have compared the list of translations with the most accessible trade bibliographies, and the result has been disappointing. In one case the omission of a colon makes the meaning of a title uncertain; other titles indicate unfamiliarity with both the German language and German bibliographical methods; "versasst" for "verfasst," and "für *die* [read *den*] deutschen Jugend," may be misprints; perhaps also "Kunstlein" for "Künstlerin." But "Bibliothek Amerikanische" instead of "Amerikanische Bibliothek" is certainly queer. We miss one French and one German translation: 'Contes du Far-West' (Paris: Boulanger, 1894), and 'Das rote A.,' translated by Margarethe Jacobi (Stuttgart: Lutz, 1897), as well as the 1855 edition of 'La Lettre Rouge A,' and the 1865 edition of 'Le Livre des Merveilles.' No other translations are included than French and German; eleven Scandinavian and seven Dutch can be found in the respective trade bibliographies. The volume consists of a number of lists, mostly alphabetical, and in some cases giving the same information twice and in similar arrangement—a most exasperating method, or lack of method. The object of a bibliography of an author is, we take it, to offer to students of literature an orderly enumeration of his writings, in chronological or systematic sequence, with references to critical sketches and book reviews. Owing to the way in which Miss Browne has arranged her material, it is not possible to gather together, with her help, without the most exacting labor, all the material—editions, translations, and criticisms—of a single one of Hawthorne's writings. Still, as a check-list for collectors, the volume will have some value.

—M. Georges de la Salle, who, during the six months he was with the Russian army as a correspondent, observed five battles and strategic movements, has written 'En Mandchourie' (Paris: Armand Colin), a sketchy account of those operations and their attendant horrors, without adding much to our serious knowledge of the events themselves. Space is given to the floods of intoxicants, to the omnipresent courtesan, to the gaming and other spurious pleasures that draw so deeply upon the Russian officers' personal and professional vigor. The author speaks of regiments with an actual strength of 500, whose muster rolls represent 2,400 in the Siberian and 4,000 in the Russian corps—discrepancies not due to the casualties of war, but to deliberate misrepresentation in peace. Returning from Mantchuria—that is, from actual observation—one can make no estimate without reserving 50 per cent. as a margin of error (p. 150). With a natural and becoming sympathy with his country's ally, M. de la Salle soon distrusts, not the bravery of the rank and file, but everything beyond personal courage that makes up efficiency. Courage is a common masculine attribute; military efficiency is a separate and superior condition. He found little discipline in the higher sense, little of the *esprit* that makes an army a homogeneous weapon in the hands of a master. He writes in the midst of a campaign: "Je suis fatigué d'entendre tant de médisances, de 'scandales,' de critiques, d'infamies même. . . . . Que m'importe à cette minute que le général X soit un âne, le général Y un ivrogne, et le général Z un joueur ou un voleur!" (p. 171). In discussing the battle of "Cha-kho" (Shakhe River), after bemoaning the insufficiency of the material and the ineffectiveness of the personnel, M. de la Salle uses in illustration a telegram from Gen. Stackelberg, absent on an extensive and important turning movement, to the commander-in-chief: "La carte de l'état-major, au lieu des montagnes qui s'élèvent devant moi, ne donnait qu'une tache blanche" (p. 172). As the Japanese appear to have guarded against almost every possible contingency, so the Russians seem to have foreseen nothing, and to have trusted to blind luck, to the prestige that belonged to race, and to a numerical superiority in theory which had no foundation in fact. M. de la Salle left the field in December, after the memory of the wounded became "comme une obsession" (p. 191) and the retirement upon Mukden a nightmare of horrors. His happiness in regaining France was intensified by the contrast, but that natural joy was blurred and tarnished by the persistent haunting of sufferings he had left behind. Nor can there be a doubt that as a patriot, outside of and beyond humanitarian considerations, M. de la Salle was disturbed and distressed by the extraordinary exhibition he had witnessed in Asia of the moral weakness and physical inefficiency of the Empire which had been honored with the sentimental friendship and the formal alliance of the Republic.

HUME'S SPANISH INFLUENCE.

Spanish Influence on English Literature. By Martin Hume. London: Nash; Philadelphia: Lippincott. 1905.

Early in 1904, Major Martin A. S. Hume delivered before the University Extension Board of the University of London a course of ten lectures, which he has now rewritten and published under the above title. The theme is attractive, the field is a wide one, and Major Hume comes to his task with the prestige of a successful historian. In turning, however, from serious historical studies to deal with *belles-lettres*, he has made a grave mistake; for the editor of the 'Calendars of the Spanish State Papers' and author of 'The Spanish People,' 'Spain in the Year of the Armada,' 'The Courtships of Queen Elizabeth,' and 'The Love Affairs of Mary Queen of Scots,' seems to have assumed that scrupulous care and first-hand knowledge may be dispensed with in the treatment of literature, however requisite they may be in history. Not that he fails to enter the usual protest against "the misuse of text-books, and particularly literary text-books, by students who think that they are a substitute for the study of originals," nor that he omits to inveigh against "authorities and text-

books" for "copying each other on minor points without much investigation." Despite such professions, the fact is that even a cursory reading of this volume will reveal that it commits two unpardonable sins: first, that, on points of scanty information, it jumps at brilliant conclusions without an effort to gather adequate facts; and, second, that in matters of minute and detailed learning it generally takes its knowledge bodily from a source nowhere mentioned.

The former sin, and the relatively lighter, may be illustrated from any portion of the work save that dealing with Tudor England. Consider, for example, in chapters five and six, Major Hume's handling of the picaresque novel. His idea of it as a fiction exhibiting "types encountered on a journey" is improper and confusing. For him it is simply the peripatetic novel. He mistakes an accident of form for the essence of the thing. 'Don Quixote' of course falls within this definition, and is so treated along with its imitations; but why exclude from such fellowship 'Pilgrim's Progress' and half the fictions of the world? Of the service of masters by a rascal—the true earmark of the Spanish picaresque tale—not a word is spoken. Roguery, indeed, seems wholly unconnected with the *genre*. Not only are 'Humphry Clinker' and 'The Sentimental Journey' pronounced picaresque, but David Copperfield is called "a sentimental and honest picaro" (p. 182), whatever so palpable a contradiction in terms may mean. Moreover, for Major Hume, any one writing a "novel of movement" is clearly influenced by the Spanish romance of roguery. Thus, Defoe is hailed as the first "who saw the full possibilities of the Spanish form as a satirical vehicle in prose," and his purely native and unsatirical 'Moll Flanders' is declared to be "evidently inspired by the 'Picara Justina'" (p. 181) on the bare knowledge that each celebrates an anti-heroine. 'Robinson Crusoe' alone of peripatetic novels escapes Major Hume's Procrustean picaresque classification. "I regard that as a story inspired by fact, just as Defoe's journal of the plague year was," he says (p. 181), as though this explained anything. On the same page occurs the surprising statement that "Fielding also wrote a poor female Quixote, which showed that he was well versed in Spanish fiction." Of course, Major Hume is thinking not of Fielding, but of Mrs. Lennox's 'Female Quixote'; yet the assumption that because a writer imitates Cervantes's masterpiece he or she must be well versed in Spanish fiction, is even more absurd than the error in name; while the nature of Fielding's actual debt to Cervantes and the picaresque novel—one of the most vital points of Spanish and English literary contact—is never pointed out. Such a mine of Spanish material as 'The English Rogue' of Richard Head and Francis Kirkman receives no notice; Nash's 'Unfortunate Traveller' is said without proof to be "evidently inspired by 'Lazarillo' and its school" (p. 164), although, since 'Lazarillo' was the only Spanish romance of roguery then extant, it certainly had no school; and Nash is unwarrantably alleged to have taken "many of his dramas from Spanish sources." It is discouraging to find 'Gil Blas,' despite the final settlement of its very slight indebtedness to Spanish sources, still maintained "to have been largely inspired by 'Marcos de Obregon'" (p. 174). Le Sage is said to have written "a poor sequel of Don Quixote" (p. 176), a reference presumably to his mere translation of Avellaneda's notorious "Second Part"; and he is further affirmed to have "lived in the French embassy in Madrid for some years at the end of the seventeenth and beginning of the eighteenth century" (p. 176). This is as misleading as the critical judgment that 'Gil Blas' is "Spanish in tone and feeling." In short, in the chapter dealing with picaresque influence, there is scarcely a statement upon which reliance can be placed; and to two centuries and a half of such influence in England are devoted just two and a half pages.

Further illustrations of untrustworthiness in fact or inference, or both, are everywhere ready to hand. The fables of Bidpai and Sendabad are confounded (p. 32); it is implied that Spain was the main distributor to Europe and England of the Oriental apologue (p.34), that indirectly the "Induction" of the "Taming of the Shrew" derives from "Count Lucanor" (pp. 48, 267) rather than from a common Oriental source, that the personal note in the English Chronicle after the fourteenth century is due to Spanish influence (p. 94). The old attribution of the Portuguese 'Amadis' to Vasco de Lobeyra is repeated, but no reference is made to the earlier Joham de Lobeira, credited by modern scholarship with the lost original (p. 110). Montalvo, the Spanish redactor, is called Montalvan (p. 113), and the fifth book of his work is dubbed the "Sergas de Espalandrin" (p. 114). Spenser's 'Shepherd's Calendar' is said to be "clearly inspired" by the 'Diana' of Montemayor (p. 119), and the more important Italian pastoral influence is passed by with the mere mention of Sannazaro's name (p. 117). Certainly 'Euphues's' style was not "confessedly copied from the Spanish style of Guevara" (p. 163), whatever its indebtedness may have been; and certainly, too, Robert Waldegrave did not translate Granada's 'Spiritual and Heavenly Exercise' in 1600 (p. 225), since he was only a printer reissuing under a new title Richard Hopkins's translation, 'On Prayer and Meditation,' of 1582. Surely, Calderon's 'Alcalde de Zalamea' is the worst possible example that could have been selected as witness to Spanish inability at character portrayal, for how many readers of the play will agree that "the characters are all personifications of fixed qualities, not human beings swayed by complex emotions" (p. 263), or that Crespo is only abstract "innate nobleness in a rustic garb"? One must wonder how the Spanish Jew, Ruy Lopez, "soon after his death" in 1594, could have "certainly figured" in Marlowe's "Jew of Malta" and "Doctor Faustus," when Marlowe himself died in 1593 (p. 275). And the desire to claim more than their due for the Spaniards can alone explain the statement that Webster's "Duchess of Amalfi" (*sic*) "was either taken direct from Bandello's Italian novel of the same name, or from Lope de Vega's dramatization of it (p. 277), for it is well known that Bandello reached Webster through Belleforest's French collection and Paynter's English "Palace of Pleasure." How obviously untrue is it of the theatrical use of "rooms with hidden doors, secret staircases with facilities for the exchange of one personality for another," that "all this was unknown to the classic drama" (p. 283), and that "to this day, when we see what is called a bustling farce, . . . it may with confidence be said that the original initiative of it came from Spain" (p. 284). The assertion that Alexandre Hardy "borrowed plots wholesale from Spanish dramas" (p. 285) is based upon no examination of the facts, for his chief sources are classic and Italian, and but five of his surviving pieces are Spanish in origin, while only two others appear to have been inspired by the Peninsula. In any case, it was not the Spanish drama but the Spanish *novela* and pastoral that influenced him, the 'Diana' having furnished one piece, the 'Novelas' of Diego Agreda y Vargas two, and the 'Novelas' of Cervantes three. (Cf. Ernest Martinèche, 'La Comédie Espagnole en France de Hardy à Racine,' 1900.)

But why multiply examples of misstatement when Major Hume is as surprising to the scholar in what he omits as in what he says? To deal with Spanish mysticism and its influence in England and say nothing of Crashaw, to consider 'Amadis' and not mention Southey, to speak of picaresque influence and not name 'Jonathan Wild the Great' or 'Ferdinand Count Fathom,' to trace the descent from 'Don Quixote' and not refer to 'Sir Launcelot Greaves' or to any translator of the book save Shelton, to offer a chapter on the literature of travel and forget Purchas, and, in discussing the drama, to give a few hit-or-miss references to mere plot borrowings which might easily have been amplified by a reading of Ward's 'English Dramatic Literature'—this is not to write the history of Spanish influence on English literature. Moreover, the work on its English side is practically confined to a study of Tudor times; for of its 316 pages not more than 16 deal with Peninsular inspiration in any other period.

The reason for this disproportion will be explained, and the second sin of the author made manifest, if the reader will turn to a volume published in 1899, 'Spanish Literature in the England of the Tudors,' by J. G. Underhill. From this source, names and titles, facts and ideas have been bodily appropriated without acknowledgment wherever Major Hume deals definitely with his subject. Indeed, it is not too much to say that he adds nothing to the information contained in Mr. Underhill's treatise beyond the identification of Antonio Perez with Shakspere's Don Adriano de Armado (p. 273). A few citations of typical parallel passages will indicate the relationship between Major Hume and his unquoted authority.

HUME.	UNDERHILL.
"His (Nicholas) first translation was a little tract from the Spanish, called *Strange and Marvellous Newes lately come from the great Kingdom of China in a Letter sent from Mexico to Spain.* But in 1578 he issued a more important book, etc." (p. 191).	"His (Nicholas) first publication was a little tract of six leaves, entitled the *Strange and marveilous Newes late y come from the great kingdome of Cayna*, and was taken, he explains, from a letter sent by a merchant from Mexico to Spain, . . . but he completed a more elaborate undertaking in the next year (1578), etc." (p. 163).
"Osorio's reputation as a scholar was as great as had been that of Juan Luis Vives in the previous generation" (p. 230),	"The treatises of Osorio da Fonseca, however, which attained a name in the latter half of the sixteenth century as great as that of those of

"Elizabeth herself cared nothing for Spanish Protestantism, but was glad to welcome Spaniards who had quarrelled with their own king, her mortal enemy. Anything to wound Philip was a delight to her. . . . But very different were the views of the more rigid school of the Protestant bishops and clergy. To them the presence of a Spaniard who acknowledged fervently the truth of Protestantism was a confirmation of their own doctrines" (p. 235).

"Lady Bacon was violently angry that her son Francis should be so friendly with him (Perez): 'A proud, profane, costly fellow, whose being about him I verily fear the Lord God doth mislike' " (p. 269).

"Then Sir Francis Bryan, Henry VIII.'s favorite, translated another of Guevara's books called *Dispraise of the Life of a Courtier* (*Menospreçio de la Corte y Alabança de la Aldea*), which was afterwards republished as *Looking Glasse for the Court*" (p. 56).

"When Philip II. came to England to marry Queen Mary, several of his courtiers wrote accounts of what they saw, and the main delight of these Spaniards was to identify the scenes of Amadis's and Arthur's imaginary adventures. At Winchester the principal object of interest with them was the so-called Round Table of the knights which still hangs upon the wall of this castle. When the Spanish ambassador in England wished to say something excessively bitter about Elizabeth and her government, he could think of nothing more effective than to compare them with some of the characters in Amadis" (p. 114).

Vives in the earlier half. . ." (p. 127).

"Elizabeth cared nothing about Spanish Protestantism, and she cared absolutely nothing about its individual exponents. She welcomed them only in order to annoy Philip II. . . . . But the Spanish heretics were heartily welcomed by the English Reformers as desirable recruits on religious and not on political grounds. That a Spaniard, the most orthodox of men, should prefer the reformed doctrines, seemed almost to demonstrate their validity" (p. 186).

"The intimacy between Perez and Francis Bacon was so great that it aroused the fears of Bacon's mother, who wrote to her son Anthony: 'Tho' I pity your brother, yet so long as he pities not himself, but keepeth that bloody Perez—a proud, profane, costly fellow, whose being about him, I verily fear, the Lord God doth mislike . . . surely I am utterly discouraged' " (p. 282).

"Sir Francis Bryan—the favorite of King Henry — (translated) his (Guevara's) *Dispraise of the life of a courtier — the Menospreçio de la corte y alabança de la aldea*. . . . A reprint was made, however, with some corrections, in 1575, by T. Tymme, minister, under the title of A Lookinglasse for the courte" (pp. 70-71).

"The nobles who followed Philip into England amused themselves with attempting to identify the scenes of the various exploits of Amadis through the country. . . . At Winchester they inspected Arthur's round table, and in their infatuation with the novel they forgot themselves and drew impolite comparisons everywhere between the English ladies and the damsels of the romance" (p. 117).

"When Elizabeth seized and appropriated the treasure which the Genoese bankers were carrying up the channel to the Duke of Alba, . . . Don Guereau de Spes (the ambassador) was put under arrest, and among the principal charges against him was that of wanton disrespect to the queen in referring to her as the Lady Oriana" (p. 303).

Such parallelisms are limited only by the extent of both works and the patience of the reader to ferret them out. Major Hume cannot plead ignorance of his authority, since in 1901 he referred to it at page 403 of his 'Spanish People'; nor can he urge a design to discard here all bibliographical footnotes, for he quotes J. Fitzmaurice Kelly's 'Taylorian Oxford Lecture' (p. 253), and G. H. Lewes's antiquated sketch, 'The Spanish Drama' (pp. 255-6). It is amusing to observe, however, that the former is used merely to confirm the unimportant statement that Lope de Vega's portrait in his lifetime adorned almost every dwelling in the capital, and that the latter is appealed to for an abstract of Lope's 'Star of Seville,' which one would think might have been more safely sought by reading the play itself.

CORYAT'S CRUDITIES.

Coryat's Crudities: Hastily gobled up in five Moneths travells in France, Savoy, Italy, Rhetia commonly called the Grisons country, Helvetia alias Switzerland, some parts of high Germany and the Netherlands; Newly digested in the hungry air of Odcombe in the County of Somerset, and now dispersed to the nourishment of the travelling members of this Kingdome. By Thomas Coryat. [London. Printed by W. S. 1611. Pp. 655.] Glasgow: James MacLehose & Sons; New York: The Macmillan Co. 1905.

Seldom has a book at the start been so handicapped as was Coryat's, and that by himself, by his friends, and by the prince-patron to whom he dedicated his 'Observations' (the title 'Crudities' looks like an afterthought). For some two years after his home-stretch he was continually adding to his first-hand waysides set down at many a spot, *currente calamo*, patches (and those seldom small) from the history of every place where he had made an hour's halt; with a score or so of Scaliger epigrams, which, however popular, were not worth as much as the single one of Sannazarro, which he had picked up in Venice. He also, besides many prolix etymologies, stuffed in two long lectures extolling travel as educative, and various bookish scraps. In the next place, his commenders, whether volunteers or on request, who all misunderstood the true inwardness of his Observations, gave him an Irish hoist by conspiring in a serio-comic extravaganza of ironics addressed to him, saturated with exaggeration and misconstruction, yet full of wit or humor that would allure the laziest reader to the end of a hundred pages and half as many more. Thereupon Coryat, seeing this porch to be of quite another order than his building, forthwith cut loose from the incumbrance, and had his embarkation from Dover printed as the first page of his forthcoming Travels. Then followed the unkindest cut—an order from the heir-apparent, who had accepted the dedication of the 'Crudities,' that the multitudinous malversations which had a charm for his boyish taste, still far from the end of his teens, should stand in the forefront of Coryat's first volume, and this order was obeyed to the letter, yet with a pagination which betokened that the extravaganza was no part of Coryat's own book, but a forced marriage and a mismatch. No further could the force of tuft-hunting go, though divinity there hedged a kinglet of whom his father was jealous and for whose death England was soon to put on black. Thus an opéra-bouffe, a grotesque and apish travesty, was made to usher in the earliest earnest and elaborate endeavor to persuade and enable "the most generous young courtiers to travel abroad, and so enrich themselves in what would fit them to do their country better service at home."

This claim of the author, iterated and reiterated, is in keeping with all his pages, even those that look most frivolous. As the first, and long the only, lamp to light up tourists along their lines, the Crudities were taken in hand by all but the foolhardy who chose to go it blind. The *editio princeps* was thus scoured to nothing by perpetual motion, so that, though libraries are said to hold such books embalmed, but one single perfect copy is now shown in all the world, and that entombed in the Chetham Library at Manchester. The Glasgow facsimile, in paper, paging, errata—even the list of errata as corrected by the author and smacking of him—above all, in engravings admired as artistically of the best, tells the story of the *princeps* in a representation beyond what most publishers nowadays have hearts for in their most pretentious issues. The Crudities are green fruits plucked on a tour in 1608 from Dover to Venice, and thence home again, going through France and Lombardy, and back by way of the Swiss, the Rhine, and Holland. The months of absence were scarcely five; about one-third of the time consecrated to Venice, the grand end and aim, and the other two-thirds divided about equally between the routes when outward and inward bound. Brief stops in transit were made at more than forty places. The start was May 14; the finish of the home sail from Flushing, October 3. Locomotion throughout was by land or water—in ship or boat or gondola, in conveyances public or private, riding or on foot, as necessity or securing the purpose of the tourist dictated.

Coryat was a man of initiatives. Both in his life and in his book, initiatives are a cardinal characteristic. He was earliest in time of genuine English travellers. His objective was not getting gain like the merchant's, nor yet the official's who is dispatched on public service, nor the pilgrim's to Compostela, Rome, or Jerusalem, where his soul would be more sure of salvation. Lithgow and Sandys, whose endeavor was nearest his own, did not start until his book was in press, nor did they move along his lines; within that circle none had walked but he. Downward from apostles and birds of passage, friars and others felt that one man is no man, and pilgrimmed two by two at least; but Coryat went forth "a solitary man," without companion or attendant, personally conducted by himself and no other. It was borne in upon his conviction, too, that a footman will see much that is hid from a horseman; and so his enterprise becomes largely a walking tour. The travelling student was thirty-two years old, son of a Somerset rector a hundred miles west of London, and had been three years an Oxford undergraduate,

His journal day by day was a miracle of minute exactness in specifying dates, hours, miles, modes of advance, and, above all, things and persons met with and impressions stamped upon him. The Continent was then so new to islanders, and our explorer so impressionable, that his jottings were beyond counting. In reading any of his chapters we say how much is here we should have failed to observe. Here is a taste of his tact at pricking into the customs of his own country some flowers of what he learned abroad:

"The Italians do always at their meales use a little forke. For while with their knife which they hold in one hand they cut the meat out of the dish, they fasten their forke which they hold in their other hand upon the same dish, so that whatsoever he be that sitting with any others at meales if he should unadvisedly touch the dish of meat with his fingers from which all at the table do eat, he will give occasion of offence unto the company, as having transgressed the laws of good manners, insomuch that for his error he shall be at the least browbeaten if not reprehended in words. This form of feeding is general in all places in Italy. The reason of their curiosity is because the Italian cannot by any means indure to have his dish touched with fingers, seeing all men's fingers are not alike cleane. Hereupon I myself thought fit to imitate the Italian fashion in this forked cutting of meat," etc.

Afterward in England a familiar friend, seeing him at table equipped with a fork, called him Furcifer (fork-bearer), not without a jocose allusion to its old Roman sense of cross-bearer—a most insulting nickname.

The earmark of Coryat's utterances is a frankness which keeps back nothing. No hiding of his weaknesses—failures in research, in Alpine climbing, in deciphering or in personal encounters—can be detected. Where is there a more winning naïveté than in his making a clean breast of pious frauds, as concerning his stealing a votive doll "only to this end, to bring it home into England to show it to my friends as a token of idolatry"; or while personating a begging friar, hat in hand, asking alms of wayfarers whom he feared as footpads, and so getting a charity from them?

In Venice was focussed more of Coryat's energy as well as time than in all places either on his way thither or backward. Full of love at first sight, he cries: "It ministered to me more variety of delights than mine eyes had ever surveyed before or ever shall if I should spend thirty years together in travelling over the Christian and the ethnick world." We are silent regarding most of his fervors as to this half-celestial city, for his sweet conceits and creations of speech defy résumé, or comparison with what has in three centuries since been said by legions in depicting this fairyland. Within a week after leaving Venice, and before setting foot on the homeland, he had written in his diary of "future travels which I have determined, God willing, to undertake hereafter both in Christendome and Paganisme" (a word which only in 1853 was giving place to Pagandom). No sooner was his book off his hands than he threw off the chains of insular bondage. An unselfish Childe Harold, he felt enfranchisement in that appetite, no more *urbis*, but *orbis*, which had grown by what it fed on. By strides through Stambul, Cairo and the Holy Land to the Aleppo caravan, he pressed on in that convoy to Teheran, and thence on its twin transport far further to the Indus and the Grand Mogul, who in Agra gave him audience and created him a chartered libertine in his domain. As a single-handed explorer he thus conquered a land world which neither Alexander nor Columbus could penetrate. He revelled in Herculean labors till five years after his farewell to England, when his wearied pulse of life stood still at Surat—a most regrettable setback to Occidental knowledge of the extreme Orient.

The Letters to the Seven Churches of Asia, and their Place in the Plan of the Apocalypse. By W. M. Ramsay, D.C.L., Litt.D., LL.D. A. C. Armstrong & Son. 1905. Pp. xix., 446.

Somewhere in this volume—unfortunately there is no index, so that it is not easy to trace a subject—Prof. Ramsay says that formerly he accepted the views of those scholars whose tendency is to date New Testament writings in the second or third century A. D.; but since that time his geographical and archæological studies have resulted in a complete change of view in this regard, and led him to revert to a considerable extent to the older traditional view of the dates and authorship of the various books of the New Testament. He has a controversy with *closet scholarship* and the subjective methods of German critics. On the whole he represents in his point of view and his methods a healthy reaction against the excessive tendency to dissection of documents and attribution of minute particles to different sources, authors, and dates, which has marked and marred recent literary criticism of both Old and New Testament. He represents archæological scholarship as over against linguistic scholarship, field work as over against the work of the study, the historical objective method as over against the metaphysical subjective method of treatment. The special field of his labors has been Asia Minor, and probably no scholar of the present day is as thoroughly versed in the archæology and geography of Asia Minor as is Professor Ramsay. He has visited every part of it, has followed the Roman roads, has ransacked villages for inscriptions, and especially has tracked St. Paul and the other early Christian workers from point to point and town to town throughout the whole territory.

In the present volume he applies to the letters to the Seven Churches in the Book of Revelation the same method of archæological, historical, and geographical study and comment which he applied to the Book of Acts, and, to some extent, to St. Paul's Epistles, in his volumes, 'St. Paul the Traveller and the Roman Citizen' and 'The Church in the Roman Empire.' His general position is a sound one, that the New Testament books spring from the circumstances of their period; they think its thoughts and answer the questions which men were putting, in the language used and understood at the time. Hence "their respective dates can be assigned with confidence, provided we understand the history and familiarize ourselves with the thoughts and ways of the successive periods" (p. 53). This assignment is Dr. Ramsay's immediate object, not, however, of the Book of Revelation as a whole, but of the letters to the Seven Churches contained in the first three chapters of that book.

The volume commences with a general discussion of the use of letters in antiquity, of the methods of transmission of letters, official, commercial, and private in the Roman world of the first century, especially in Asia Minor, and then of the use of letters among the early Christians, the part which letters played in the administration of the churches and their relation to one another and in early Christian literature. Our author supposes a pretty thorough organization of the Christian church, particularly in the wealthy province of Asia, at a very early date, and an arrangement for constant epistolary communication among the churches by means of greater and lesser circuits. He concludes that the order of the Epistles to the Seven Churches in the first part of the Book of Revelation was determined by the arrangement of such a circuit for convenience in the distribution of letters, and that the churches addressed were respectively the centres from which information was disseminated to special districts by lesser circuits. Landing at Ephesus, a messenger would move north to Smyrna and Pergamum, thence swinging around toward the east, southeast, and south to Thyatira, Sardis, Philadelphia, and Laodicea, and so returning to the original starting-point, Ephesus. He does not mean that the letters in Revelation were actually separate letters sent to the different churches, or that they possessed even the character of a general circular letter. The letter-writing custom had assumed such importance in the church that when St. John composed the Revelation on Jewish apocalyptic models, combining with that Jewish apocalyptic material other material drawn from the customs and ideas of the people of Asia, the whole colored by its relation to the immediate present and the struggle of the Christian Church with persecuting Rome and the worship of the beast (that is, Cæsar worship), he prefixed to this apocalypse a practical moral exhortation cast in the literary form of letters. These letters, therefore, are not real letters, but a literary device by which John addresses moral instruction to the Christians of the province.

Professor Ramsay agrees as to date with the present trend of criticism, that the Apocalypse derives from the period of the Flavian persecution, in the latter years of the Emperor Domitian—approximately, perhaps, 95 A. D. He discusses in special chapters the nature of the Flavian persecution and the evidences of that persecution in the province of Asia, the character of the imperial religion, the institutions of the various Asian cities, the character of their populations, and especially the place of the Jews in the population of those cities. He then takes up the letters one by one, giving first the history of the city to the church in which the letter was written, then an application of the letter to the conditions of that church. He seeks to show that the author of these letters was intimately conversant with the history and conditions of those churches; that the letters are full of local references, and that those references fit especially the period ending with the Domitian persecution. These chapters constitute, in fact, a sort of archæological-historical commentary on the Epistles to the Seven Churches.

Professor Ramsay's own intimate ac-

quaintance with the various sites makes his comments peculiarly interesting. He pictures the physical surroundings of each city with a vividness that gives new reality to the references in the letters. One sees how the changeableness of the site of the city of Ephesus, following its receding harbor westward, is reflected in the letter to that city. The royal character of Pergamum; the supposed impregnability of Sardis, towering high above the plain; Philadelphia, suffering from the shock of earthquake; wealthy Laodicea, a city of bankers, the centre of a trade in a peculiar glossy black wool—these all were in the mind of the writer of the Seven Letters and determined the treatment of his theme and his allusions. Further, we have in these letters, as Prof. Ramsay points out, a most valuable commentary on the moral conditions of the Christian Church in the great Asian cities at the time of the Flavian persecution, toward the end of the first century.

The author makes much use of coins, and, so far as they exist, of monuments and other contemporary documents, and the book is a mine of information regarding the history and conditions of the province of Asia. Of course there are some cases where Professor Ramsay, in his archæological enthusiasm, will seem to have discovered in the text references and allusions which do not actually exist, but in general he is sane and keeps himself well under control.

While the author's views with regard to the date of the Apocalypse fit generally into the prevalent current theory, on the question of authorship he is opposed to the prevailing view, and ascribes the book to the Apostle John. The chapters in which he deals with the question of authorship are not as strong as the other parts of the book, because here he is compelled to resort to subjective rather than objective arguments. He pictures St. John as an exile in Patmos, possessed with an authority which leads him to speak as Ignatius and other Christian leaders of a slightly subsequent period never venture to speak. Dwelling in his exile on the conditions of the churches in which he had labored, the persecution in which they were now involved, realizing the meaning of the struggle with the beast of Rome, he pours forth his meditations on the great theme of this struggle, full of assurance of the speedy and final victory of the church, in the mystic form of an apocalypse, preceded by this more practical address to the seven great central churches of the region which had been the scene of his labors. As Professor Ramsay incidentally points out, Ignatius, writing not many years later to some of the very same churches, appears to be quite unacquainted with these letters, which seems strange if they were indeed written by John the Apostle. But the argument from silence is always of a most uncertain character.

Every reader of the Bible will welcome this book as not only extremely interesting in itself, but also full of valuable information with regard to the province of Asia and the conditions and practices of the Christian Church in the latter half of the first century A. D. The text is illustrated by numerous photographs and by drawings made from coins and monuments by Mr. John Hay, Mrs. Ramsay and the Misses Mary and Margaret Ramsay. The printing is careless, because the plates are imperfect. Often three or four letters on a page —generally not more than one in any one word—have disappeared entirely. It is rare to find many consecutive pages without one or more letters missing.

Concordanza delle Opere Italiane in Prosa e del Canzoniere di Dante Alighieri. Pubblicata per la Società Dantesca di Cambridge, Massachusetts. A cura di E. S. Sheldon coll' aiuto di A. C. White. Oxford: University Press; New York: H. Frowde. 1905.

Few learned or literary associations have offered such acceptable proof of their activity as has been afforded by the Dante Society of Cambridge, Massachusetts. Under the leadership of its president, Professor Norton, this small group of Dante lovers has given to the world, in addition to its highly prized annual report, two of the most important works ever issued to facilitate the study of the *altissimo poeta*—Professor Fay's 'Concordance of the Divina Commedia,' published in 1888, and Professor Sheldon's 'Concordanza dell Opere Italiane in Prosa e del Canzoniere di Dante Alighieri,' which has just appeared from the University Press in Oxford. Within a few years is expected a concordance of the Latin writings of Dante, for which much material has already been collected. These three volumes will constitute a complete apparatus for the investigation of the great Florentine's language and style, and will form the nucleus of the outfit of every Dante scholar. It may be well to state here that Fiammazzo's recently printed "complete concordance" of Dante's Italian and Latin works, put forth as a third volume of Scartazzini's 'Enciclopedia Dantesca,' in no way enters into competition with the vocabularies mentioned: it is merely a word-list, accompanied by references, without distinction of uses or citation of passages.

Professor Sheldon's book makes a handsome volume of some 750 pages, in general appearance not unlike the 'Concordance' of Professor Fay, Dr. Moore's Oxford Dante is taken as a basis for the text; the third edition fortunately appeared just in time to be utilized. It is a pity that the miscellaneous lyrics are still treated by Dr. Moore in an uncritical way, as regards both selection and reading. Nothing better, however, is available; and even if Barbi's long-announced publication were at hand, the satisfaction of working with a surer text would not outweigh the advantage of using a uniform edition of all the writings.

The first requisites of a concordance are completeness and accuracy, and these qualities the new work seems to possess in an eminent degree. A cursory investigation discloses no errors save those repaired in the brief two pages of *corrigenda*. Perspicuity, the next essential, is more easily judged; in plan and execution this book is clearness itself. The enormous typographical and other technical difficulties have been intelligently met by editor and printer, and so successfully overcome that the casual examiner would never suspect their existence. On the upper part of each page are the entries from the verse; beneath, separated by a line, are those from the prose. Thus the two lists are carried along together, and the reader is enabled at every step to compare the poetic and the prose usage. Glancing at the most frequent terms, one sees, for instance, that *amore*, which covers seven pages, is preeminently a poetic word, while *uomo* (five pages) and *cosa* (nearly nine) belong rather to prose. To avoid unnecessary bulk, the articles, the verbs *avere* and *essere*, and the commonest pronouns, prepositions, conjunctions, and adverbial particles are omitted altogether; and a few other constantly recurring words, such as *come, dare, dove, vedere, venire*, which offer no interesting peculiarities of form or use, are followed only by numerical references to all the places where they are found. For every other word we have, with each reference, a quotation long enough to show the construction and meaning. A nice discrimination is revealed in the choice of words entered with or without citations: for instance, *potere* and *volere* have only the references, while *dovere, parere, piacere* are provided with the full apparatus. As one studies the book, it becomes evident that similar careful judgment has been brought to bear upon every question, however great or however small.

While the general plan is carried out with perfect consistency, there is nothing wooden or mechanical in the application of its principles. To adduce a few examples: The plural *egli* and *elle*, the dialect forms *nui* and *vui* find a place, whereas personal pronouns as a rule are excluded; although the verb *essere* is not admitted, such forms as *fia* and *fora* are rightly accorded entrance. The question of duplication and cross-reference is a perplexing one, and has been settled in each case to the greatest advantage of the user of the book. Such words as *virtù* and *spiacere*, which occur also in the quite dissimilar alternative shapes *virtute* and *dispiacere*, have their two or more sets of forms printed separately, each in its proper alphabetical place. On the other hand, such doublets as *cuore* and *core, fiero* and *fero* are not parted; likewise, words with prosthetic *i*, such as *stabile* and *istabile*. *Scusare* and *iscusare* are registered together, but *escusare* has a special entry. It is fortunate, indeed, that the 'Concordanza' has had as chief editor a man in whom the profoundest scholarship and the minutest painstaking have not obscured the light of plain common sense.

The purposes served by such a book are manifold. Its importance for the lexicographer and the philologist is immediately manifest. To the literary investigator it offers inexhaustible opportunity for the study of style. The confrontation of Dante's prose and verse language has already been mentioned; with the help of the Fay 'Concordance' one may also trace the development of the poet's vocabulary; by using this volume as a basis of comparison one may discover how far Dante's diction resembles and how far it differs from that of the other songsters of the *dolce stil nouvo*. Furthermore, the interpretation of many a contested passage will be authoritatively established by this record of Dante's actual practice, and the same evidence will go far toward solving the problem of genuineness in the case of doubtful works ascribed to him. If, for example, the language of the 'Fiore,' which several critics of late have attributed to our poet, be compared with Dante's early usage, as

disclosed in this book, it may be predicted that the question of authorship will be speedily decided, and decided in the negative. To name the profitable uses to which the volume may be put would be an endless task. It is a pleasure to record the advent of a work of such varied interest and utility, which is at the same time a monument of American scholarship.

An American Girl in Munich. By Mabel W. Daniels. Boston: Little, Brown & Co.

"Impressions of a Music Student" is the subtitle of Miss Daniels's book. Its 286 pages contain a record of her experiences in studying music in Munich during the ten months from September, 1902, to July, 1903. The reader must not expect anything resembling Amy Fay's 'Music Study in Germany,' of which about twenty editions have been printed, and which has a great deal of interest to relate about Liszt and other prominent musicians of his day. The stars in the present German galaxy are fewer and smaller, yet Miss Daniels found some very good men from whom to learn the various branches of music, including two whose fame is international—Thuille and Stavenhagen; and those who have heard her compositions aver that she made good use of her opportunities.

Five years ago, she informs us, women were not allowed to study counterpoint at the Munich conservatory; not on moral grounds, apparently, but because the ability of the feminine intellect to cope with double counterpoint in the tenth was questioned. The class is now open to women, but few avail themselves of the opportunity. One victory, however, is to be scored: there are already two women enrolled as professors among the forty on the list. But no woman had ever entered the score-reading class, and Miss Daniels created quite a commotion when she asked to be admitted. After some parley her request was granted, but she felt as if she ought to be labelled, like the denizens of the Zoo: "Rare. From North America." On entering the room where the score-reading class met, she encountered the astonished gaze of thirty pairs of masculine eyes. There was a low whispering, and, when she was asked to take her seat at the piano, she heard one of the men smother a laugh. On this and other occasions she was surprised to see how much deference was paid to professors. Whenever one entered the room, the students all rose and stood until he left, or, by a gracious wave of the hand, gave them permission to resume their seats. But then, in Munich even the street-car conductors touch their hats to entering passengers.

A music student in Munich has advantages for hearing good performances. She can, on presenting the Conservatory certificate at the box-office, get a good parquet seat for half-price. There are disadvantages, too—such as the difficulty of finding a boarding-place. Not that there are not *pensions* enough and to spare; but women or men who are likely to drive away other boarders by their incessant singing, or violin or piano playing, are shunned, or at best relegated to a garret and given a limited time to practise in, say from 9:30 to 12 and from 4 to 7. Miss Daniels also suffered from the German horror of fresh air in rooms, and suggests that a Fresh Air Fund would be a splendid thing over there. The shops, too, did not please her; they are not nearly as finely decorated as ours—with one exception, the sausage store, which is a thing of beauty and a joy forever. Naturally, she has a good deal to say about the gastronomic habits of the Bavarians, and is puzzled for an answer to the question: "How can a people who seem so lethargic, and who make no disguise of their love for the product of the soil and the grape, produce such marvellous, almost superhuman, results in the fields of music and philosophy?"

Miss Daniels's book contains plenty more of these observations and reflections, and there is not a ponderous page, yet she has attempted to enliven her narrative by weaving into it a boarding-house love story. It would have been wiser to study her German and read her proofs carefully; her book *wimmelt* with misprints (see pp. 21, 50, 52, 71, 106, 111, etc.). Is a pfennig really a fifth of a cent?

The Poems of Gaius Valerius Catullus. With an English Translation. By Francis Warre Cornish. Cambridge (Eng.) University Press; New York: Macmillan. 1904.

Mr. Cornish is a classical scholar of no mean reputation and attainments. That may be said in the very first place. He must also be a bold man. That follows from the task he has set himself, to translate Catullus into English prose. The result is what critics are wont to call a "conscientious" version. But, in matters of poetry, an atom of inspiration might outweigh a ton of conscience, and the atom of inspiration seems here to be lacking. Mr. Cornish's translation has been in preparation, he tells us, for many years. We are, therefore, surprised to find in it bits of English that sound very peculiar. What graceful English poet, for example (and Catullus was a graceful Roman poet), would write, "with good help keep safe the race of Romulus"? or, "come you here into the fire, full of rusticity and clumsiness, chronicle of Volusius"? or, "Thyades crying Evoe with flying hair"? or, "from whom first all those good things had their springing for me"? or scores of other sentences that might be cited? Yet surely a good poem, or a good phrase, in Latin should be made a good poem, or a good phrase, in English. One might cite unpleasant repetitions, like "parents' death," "death of his young son," in successive verses, for *extinctos parentes* and *primaevi funera nati* (by the way, does not *primaevi* mean "firstborn"?); "falls out," and "is shaken out," of the unlucky apple in c. 65, for *procurrit* and *excutitur*. Nor does Mr. Cornish avoid rhythmical sentences, those marked blemishes of a prose style, censured so long ago by Quintilian: witness, for example, "See how mighty and rich for you is the house of your husband"; "I entreat you, my sweet Ipsithilla, . . . bid me come and rest at noonday with you"; "Maiden modest and chaste, give back the tablets." Nor in general is there to be found such felicity of expression as is needed to justify a prose version of a true poet. There are, indeed, examples of neat, rather than beautiful, renderings of single words or phrases, but no sustained power. One or two instances will suffice to show what we mean. Take the sonorous, reëchoing dignity of those famous lines,

> "Montium domina ut fores
> silvarumque virentium
> saltuumque reconditorum
> amniumque sonantum."

These Mr. Cornish renders, "that thou mightest be the lady of mountains and green woods, and sequestered glens, and sounding rivers."

> "Nec meum respectet, ut ante, amorem,
> qui illius culpa cecidit velut prati
> ultimi flos, praeter eunte postquam
> tactus aratrost,"

is rendered, "And let her not look to find my love, as before; my love, which by her fault has dropped, like a flower on the meadow's edge, when it has been touched by the plough passing by."

This is "conscientious" and "accurate" enough, but what has become of the poetry?

The Basis of English Rhythm. By William Thomson. Glasgow; W. & R. Holmes. 1905.

It is hard to maintain a properly judicial spirit in reviewing this pamphlet of scarcely sixty-three pages. By it any adept is likely to be rapt into a trance of amazed enthusiasm, searching in vain among his memories of the hundreds of jottings, notes, remarks, essays, articles, booklets, books, and tomes which have appeared since George Gascoigne penned his all too brief and all too hurried 'Notes of Instruction' in 1575, for even one with anything like so much pith, sap, and kernel in so little space. In several respects it is the most important utterance yet made on the subject. Who disbelieves should read it and be convinced. He may disagree with some statements and inferences, but he will find himself understanding every sentence at first reading, and reading many sentences over and over for mere relish of their novelty or cogency, or sound, plain common sense. Everywhere he will be stimulated to thought, and much of it will be new thought, much instant clarification of old puzzles.

Few, indeed, are the points calling for animadversion, yet the pamphlet has some small faults. Paragraph 4, for instance, is not germane to the discussion. Again, with any one possessing so fine and accurate an ear as Mr. Thomson's, we hesitate to disagree as to rhythm; yet the natural accents of the prose phrases cited in paragraph 6 do not appear to be equidistant in spontaneous utterance, nor the groups to be equal. His ingenious "jumble-hexameters" on page 18 have no cæsura. His scansions of the French verses he cites make us feel that he had best stick to his own tongue. The habits of enunciation, and therefore the fabrics of versification, scouted in paragraph 10 as unthinkable or impossible, are so indeed, especially for English, and perhaps for most, but not for all, human tongues and ears. It is not clear why, at the top of page 35, the first syllable of "blowing" is marked *short* and the second *long*; nor why, on page 41, "ripples" is marked similarly.

These are microscopic defects. More serious (pp. 26, 27) is the failure to comprehend Lanier's clear distinction between primary and secondary rhythm. Mr. Thomson's expositions of variety in secondary rhythms is here very ingenious and entirely

convincing, but Lanier allows that upon one primary rhythm different secondary rhythms may be superposed according to the incidence of the ictus. Least of all can we agree with Mr. Thomson when (pp. 39, 63) he minimizes the difference between iambic and trochaic, anapæstic, and dactylic movements. The analyzer may fulminate forever against the separate existence of iambs and anapæsts, and asseverate that they are mere negligible subvarieties of trochees and dactyls; he may prove categorically that there are not and cannot be such metrical units in English as iambs and anapæsts; the creator of English poetry who genuinely comprehends his medium of expression cannot but feel that in English the distinction between rising and falling rhythm is vital and fundamental.

We have called attention to most of the essay's weak points. They detract from its atmosphere no more than a dead mouse or two would affect the air of a whole Alpine valley. To quote the best of its good things would be to reprint half the pamphlet. The mere mention of nomenclature and notation usually sickens a student of books on versification, each of which customarily foists upon such a public as it secures a set of new words and a system of novel marks more inept and more clumsy (if possible) than the last. One generally finds the nomenclature unacceptable, and the notation incomprehensible, or at best barely half-intelligible, and obtains from it a very faint conception of how the author would read the verses he comments upon. Behold, Mr. Thomson puts forward a few new terms, each of which will aid the clear thinking of any user and will fit aptly into any one's vocabulary. As for his notation, when we run over the series of musical notes without staff-lines which Mr. Thomson prints with a quoted line of verse, we know exactly, to the minutest detail of utterance, how he reads it, how he pronounces it, how he enunciates it. We have always felt an ineradicable prejudice against the possibility of any one's devising a method of using musical notes to set forth the characteristics of English verse as read, not as sung. This prejudice is now uprooted and abolished. We perceive that in previous systems using musical notes to express methods of scansion, the fault was with the application, not with the signs employed.

Virtually Mr. Thomson gives us no theories. He is all practice, and such practice! He dares to scan English verse neither as if sung nor as if read as prose, but as naturally read as poetry. And the scansion is a success. He conveys to one with miraculous ease how he reads "The Battle of the Baltic" or Shelley's "Away, the moor is dark beneath the moon," showing that he perfectly comprehends those pæonic and semi-pæonic lilts which are a despair or a confusion to most writers on English prosody. His notation is all he claims for it. A Scot, a Californian, and an Australian, each at home, may by its means carry on an intelligible discussion involving nearly all the subtleties of metrification. Divergent or contradictory interpretations of the movements of any line or phrase may be set forth without ambiguity. We know instantly and finally how Mr. Thomson would recite "All, all are gone, the old familiar faces," or "Take your own time, Annie, take your own time," or "What's Hecuba to him or he to Hecuba?" If we disagree (and we, for example, have found ourselves disagreeing positively), we can at once set down our own rendition in his notation and compare it with his. To comprehend it or to use it, no knowledge of music is needed. He expresses without effort the difference between the way he would read a phrase as mere prose, or as in iambic verse, or as in anapæstic or in pæonic. Who, finally, capable of judging, can fail to rejoice over his plain, simple, understandable distinction (p. 51) between "heel-rhythm" (mechanical beating-out of the type-movement), "head-rhythm" (intelligible, unimaginative delivery), and "heart-rhythm" (the impassioned utterance of one who feels all the subtleties of the words)? Mr. Thomson's notation is far from perfect. We by no means believe that it is likely to win universal acceptance, oust all others, and take a place of permanent usefulness between the alphabet on the one hand and the score on the other as an abiding instrument for the expression of ideas. We believe that a better, simpler, more compact notation, more in line with Schmidt's, in his 'Rhytmik und Metrik,' can and may be devised. But at least, after many futile attempts, here is one good notation at last to start us towards a better. Our doubt is, can others less gifted than its deviser learn to apply it as well as he?

So much matter is in this treatise and so often does one look back to compare expressions, that, even in so thin a booklet, one misses an index.

China in Law and Commerce. By T. R. Jernigan. The Macmillan Co.

In addition to his honorable record in the consular service of the United States, Mr. Jernigan has placed English-reading people under further obligation by issuing what is probably the best single volume for all who have practical relations or business with the Chinese. One may by long labor select from the mass of printed matter concerning China much of what Mr. Jernigan has collected; but here in one handy book is choice and exact information, carefully sifted, tested, and arranged concisely and in an orderly manner. He has made a special study of those features of law and custom which help to explain a country like China, in which each province exists as an independent unit sufficient unto itself, while in theory the power of the Emperor is unlimited. The antagonistic elements thus presented to the alien's view of administration are harmonized apparently by the universal solvent of a common educational and social system. The real basis of this perduring fabric of government proceeds from the family unit, and not from the central authority at Peking—thus reversing the Japanese system. The customs which are the foundations of all law in China, are the customs of the family, and it is difficult to know the inner springs of history or everyday procedure unless one has studied the family life of the people. This Mr. Jernigan has done so well that his text has a commendable clearness and directness. One feels here the firm touch of one who, besides consulting standard authorities, has had long observation and practical experience.

We know of no book that enables one to see clearly those differences in the great Chinese mass which have been wrought by the physical features of the country, and by cosmical influences operating through thousands of years. For example, in the United States the drainage of the country is from north to south, while that in China is chiefly from west to east, the three great commercial cities being naturally at the mouths of her three great rivers. Centuries of agriculture have created in the Chinese peasant a frenzy for removing the forests, with the result that now he must grub up grass, roots, and the droppings of animals for fuel, and thus keep the treeless land denuded. The cutting down of the forests has not only been the cause of drought and flood, but has had the effect of congesting population along the river valleys and maritime provinces, leaving considerable portions of China uninhabited. North China and South China have been virtually separated for ages, and only in comparatively modern times have the two differing populations mixed.

Keeping in view these differences, created not only by ethnic origins, but by natural forces, the author proceeds to discuss, in fifteen chapters, Statute and Family Law, Tenure and Transfer of Property, Taxations, Courts, Guilds, Business Customs, and Transit by Land, Water, and Railway, etc. The land tax is the chief source of revenue. The coffers of the Government would be usually full if the administration were honestly conducted; but, while the revenue of the Empire ought to be 115,000,000 taels, derived from the land tax, salt gabelle, customs duties, etc., not more than 80,000,000 taels actually reach the treasury in Peking. Even of this sum, more than half is already mortagaged for the payment of foreign loans and indemnities. Sir Robert Hart shows that at present the only hope of a revenue sufficient to keep China from bankruptcy is in a rearrangement of the land tax, and in his recent memorandum, he indicates how the reform may be accomplished.

There are many subjects of immediate and practical interest to all foreigners who have any present or prospective economic dealings with the Chinese, and one is tempted to quote from these chapters, so rich in valuable information, and so clearly put, but we refrain. If, however, Mr. Jernigan's volume accomplished nothing else than to show how all life in China, down to the minutest point, is communal—as, for example, even to the buying of an ox to be used in turn by the owners, and to the business of begging—his volume would be welcomed. It makes a real addition to the comparatively few books on China that penetrate below the surface of things. We must, however, call attention to the chapters on land transit and water transit, which the new enterprises are so seriously to disturb, and which have already been an efficient factor in producing the Boxer rebellion. A concluding chapter on railway transit gives the map of the country as expressed in terms of the steel rail. There is a good index to this noteworthy book.

Cavour. Da Domenico Zanichelli. Florence: Barbèra. 1905.

Students of the Risorgimento have long esteemed Professor Zanichelli for his edi-

tion of Cavour's 'Scritti,' to which he prefixed an admirable introduction. He has now produced in one volume an exhaustive study of Cavour's political career, which will be indispensable to those who wish to know thoroughly the doctrines and aims of the great statesman. His purpose is analysis, not narrative, and he succeeds admirably in laying bare the evolution of each line of policy, showing how far circumstances or the opinions of friends and foes caused Cavour to change his position.

Professor Zanichelli devotes nearly half of his book to the years earlier than 1850, the date of Cavour's entrance into the Cabinet; and, if at first this seems a somewhat disproportionate allowance, we conclude, before the end, that it was wise. For it was during the preceding fifteen years that Cavour, by study, travel, and reflection, prepared himself for a political career, so that at forty he had completely mastered the principles which he was to make prevail in Italy. Without an ample account of these years of preparation, Cavour's immediate leadership on reaching office would seem almost miraculous, instead of the inevitable result of immense training plus genius. This is proved by his articles in the *Risorgimento* during the Revolution of 1848, which leave no doubt as to his ability as a political thinker. Read in the light of subsequent events they are almost incontrovertible, and one might wonder why they and their author were disregarded at the time; but that is likely to be the fate of any publicist who, in a period of upheaval, stands as the spokesman of reason, and takes long, clear, sane views. Professor Zanichelli, by generous quotations and searching analysis, has no difficulty in establishing Cavour's superiority; but perhaps it would have been well to explain more fully the doctrines of the men and groups that opposed him. The historian ought not to take it for granted that, because the Neo-Guelf or the Unitarian politicians proved "ridiculous," Neo-Guelfism and Unitarianism may be treated as unimportant. On the contrary, it should be his business to make intelligible the spell cast by even crazes and delusions at their height.

From Cavour's assumption of the premiership in 1852, Professor Zanichelli gives us an uninterupted analysis of the policy which led to the political and industrial regeneration of Piedmont and the participation in the Crimean war, to the alliance with Napoleon III., to the war against Austria, to the annexation of Central Italy and the Two Sicilies, and to Cavour's prophetic speech, just before his death, on the Roman Question. We heartily commend his treatment of this marvellous political achievement, not so much because it contains fresh revelations as because it is uniformly sound. He emphasizes permanent principles rather than transient events, no matter how dramatic these may be. Accordingly, he tells less about the steps which led to the union (*Connubio*) between Cavour and Rattazzi than about the significance of that act. He passes over unmentioned the real cause of the ministerial upheaval in 1857. He attaches little weight to such favorite catch questions as, Was Cavour always a Unitarian? and, Did he originate the Crimean venture?

Concerning the charge of craft which is often brought against Cavour's statesmanship, this critic renders a general verdict of "justifiable." No part of his work is more acute than that in which he shows how, in the desperate months while Garibaldi was freeing Sicily, Cavour was driven to adopt guileful methods which he detested. "He bent to circumstances, he thought more of the end than of the means," says Zanichelli; "he acted as Pitt had acted toward Ireland, . . . but he was constrained to do so because he found himself in one of those conditions in which political morality does not coincide—on the contrary, it clashes—with private morality." A statesman, the author goes on to say, in seeking the welfare of his country,

"ought always to employ means which do not conflict with the principles of morality; but when this is impossible, and he has to face the dilemma of either not fulfilling his duties as statesman or of infringing moral principles, he ought to fulfil his duties. . . . History has no mercy for incompetent but honest statesmen; come what may, they must be competent. This is not the doctrine that the end justifies the means, but, on the contrary, the Roman doctrine that the supreme law, to which everything must yield, is the safety of the State—that is, of the country—to which all must be sacrificed."

These quotations sufficiently indicate Professor Zanichelli's attitude on the moral question; he further performs a real service in showing how intricate that moral question is. You may, for instance, condemn Cavour for playing fast-and-loose with Garibaldi's expedition, but you may find it difficult to suggest an alternative policy which would have been more moral and equally productive of good.

The general reader, especially if he be a foreigner unfamiliar with the details of the Risorgimento, will need to seek outside of Professor Zanichelli's volume for a narrative of events to make some of his criticism clear; for he does not supply dates and connecting links of historical action. But by one steeped in the subject, this study will be highly esteemed. It paints soberly and truthfully the central figure in the most splendid political achievement of Europe in the nineteenth century. Zanichelli's conclusion deserves to be quoted, since he is a scholar who strives to write with scientific restraint.

"Cavour," he says, "is the greatest statesman of modern Europe, because it was he who was able with the smallest means to obtain the greatest results. In him are Richelieu's alert and prudent audacity, Pitt's fascination of speech and geniality of ideas, Gladstone's humanitarian and civic sense, Bismarck's vastness of conceptions and force of character to realize them in spite of all obstacles. Greater than all, because more complete, more harmoniously balanced than all. He is the most ideal political leader the world has ever had; in him the calculating coldness of the statesman was united with the enthusiasm of the apostle, the audacity of the tribune, the courage of the conspirator and the rebel."

Comparisons are uncertain, and it is impossible to say what Richelieu would have done had he lived in the last generation; but whoever wishes to get a fair measure of Cavour's extraordinary genius should follow him day by day from his conference at Plombières, in the summer of 1858, to the peace of Villafranca, in July, 1859, and again from March to November, 1860. What might not Italy have been saved had he lived twenty years longer!

Lectures on the Historians of Bohemia. Being the Ilchester Lectures for the Year 1904. By the Count Lützow. Henry Frowde. 1905.

The neo-Czechish movement in Bohemia, like the neo-Hellenic movement in Greece, which preceded it by a generation, has its roots in sentimental and historical grounds. By the apologists of Austrian rule at Prague the Society of the Bohemian Museum is represented as a group of visionaries even more than as a body of rebels. On the other hand, the Czechs themselves find in the past, and particularly in their glorious century of 1420-1526, the truest and most substantial basis of their present aspirations. The logic of events, which to those of the Hapsburg party seems unanswerable, is to the patriots of Bohemia nothing more than an example of foreign brutality, and for them sentiment fed upon history is the animating impulse of all political life. The works of Palacký are a magazine of choice political quotations suggested by events in the national annals and turning upon the anomaly of Hapsburg rule or the ancient feud between Czech and German. After the revolution of 1848, when asked to take a seat in the Frankfort Parliament, he declined, on the ground that he was not a German, but a Bohemian. "The rulers of Bohemia have often been on terms of intimacy with the German princes, but the Bohemian people has never considered itself as German." And elsewhere he states, in a passage which has become a watchword, that Bohemia existed before Austria and will outlive her.

We refer thus to the general connection between politics and history in Bohemia because Count Lützow's lectures at Oxford have their origin in a wish to do something for the Bohemian cause by illustrating before a foreign audience the wealth of Czechish traditions. When Palacký completed the revised edition of his 'History' in 1876, a great banquet was given him, at which, when speaking of himself and his work, he gave his final testament to his fellow-countrymen. Recalling the intellectual eminence of Bohemia at the time of Huss, he placed before his hearers one prime duty, namely, that of extending the national culture. Count Lützow ascribes to this injunction his presence at Oxford, and, even without such a statement from his own lips, it would not be difficult to see how far his study of the past has been stimulated by political motives. We do not mean to imply that his lectures are studded with denunciations of Austria, or that he casts aside the methods employed in impartial research; but behind the calmness of his tone may be discerned the intense fervor of the patriot, and we are enabled to realize from his whole treatment of the subject how inseparably connected in Bohemia is modern political propaganda with memories of the Hussite movement and the Thirty Years' War.

These lectures will serve a most useful purpose, for in England and the United States hardly any one has a detailed knowledge of Bohemian history. Count Lützow, on making especial inquiry to see how many references to Palacký occur in the works of English writers, found that they were most scanty, and could discover in one book alone proof of real acquaintance with them. Bishop Creighton, in preparing an account of the Hussite movement, had gone to the greatest of the Bo-

hemian historians, and from him to his sources in the chronicles of the fifteenth century. Yet even now, says Count Lützow, "when the great work of Bishop Creighton has somewhat enlightened the English public, the names of Conrad of Waldhausen, Milič of Kremsier, and Matthew of Janod are known but to few." Among Bohemian historians recently deceased, Anton Gindely is perhaps better known to English readers than any other from his monographs on the *Majestätsbrief* and the Catholic reaction in Bohemia, as well as from his excellent book on the Thirty Years' War. Of those still living, Wenceslas Tomek, author of the standard life of Ziska and of a history of Prague which is comparable with Gregorovius's 'Rome in the Middle Ages,' is the most famous, though Professor Goll also stands in the first rank through his writings on the Bohemian Brethren.

While Count Lützow alludes briefly to his contemporaries, the chief of his attention is devoted to the chronicles of the Middle Ages and the era of the Reformation. Here the conditions fixed by a popular course of lectures compel him to be brief in his notice of all save the now famous authorities, like Cosmas, Benes of Weitmil, Lawrence of Brezof, Sixt of Ottersdorf, and Paul Slála. Palacký covered this same ground in one of his earliest works, 'Die Würdigung der alten böhmischen Gesichtschreiber.' Count Lützow has found his task rendered much easier by the notes and criticisms of his illustrious predecessor. Himself one of the most eminent among Bohemian scholars, he gives us simply and tersely the results of the most recent research on technical points in conjunction with Palacký's views on the larger issues. To many of our readers we can best convey an impression regarding the style and quality of his work by stating that it resembles a compressed Wattenbach with an element of current political interest added.

We have stated that Count Lützow is a Bohemian patriot; but to show how he guards against the use of hard language, we may instance his treatment of Æneas Sylvius among writers of the fifteenth century and Professor Höfler among the moderns. Of Æneas Sylvius, whose diplomacy during the Council of Basel cannot be remembered with pleasure in Bohemia to-day, he has no worse censure than the following passage:

"Many untruthful tales concerning Bohemia that have since been incessantly repeated, are due to Æneas Sylvius; among these is his report of the death of Ziska, whom he describes as dying blaspheming and ordering his skin to be used as a drum. It is difficult to read anything more repulsive than this account of the death of a man who, though not untouched by the cruelty of his time, was, according to his own lights, a fervent Christian and a true Bohemian patriot."

While these words are direct, they seem self-contained when one remembers how open to criticism and recrimination is the early part of Æneas Sylvius's career. Of Höfler's reply to Palacký, Count Lützow says little besides pointing out that it was printed at the Imperial printing-press, and that its inaccuracy is proverbial in Bohemia.

When one remembers what happened to the Czech race after the battle of the White Mountain, he will find no difficulty in understanding why the present régime at Prague is hated on historical grounds. Count Lützow undoubtedly expresses in these lectures the sentiments that animate a large majority of the Bohemian population. But, though stating his position with firmness, he does not suffer his cause to be prejudiced by the use of rancorous language, while in his account of the Czechish historians he furnishes information of which the English-speaking world is sorely in need.

AMERICAN INSECTS

By VERNON L. KELLOGG, Professor in Leland Stanford. With 812 figures and 11 colored plates. 647 pp. $5.00 net, postage extra.

This sumptuous volume covers the entire American insect world, including moths, butterflies and beetles, to which separate volumes are often devoted. Written in a style to interest the general reader, the arrangement is systematic and reasoned, and it is probably the most valuable handbook of the subject for the technical student or amateur collector. It is distinguished by much new matter, the results of the author's ingenious observations, and by many original pictures illustrating species not before figured in general insect books.

LONGMANS, GREEN, & CO.'S NEW BOOKS

Lynch-Law

An Investigation into the History of Lynching in the United States. By JAMES ELBERT CUTLER, Ph.D. With Foreword by Professor W. G. Sumner and 13 Charts and Diagrams.

". . . A rarely interesting and suggestive study. . . . His discussion is entirely dispassionate, is conducted without partisanship, and in the true spirit of scientific research. It is this spirit which gives the volume its especial value to the student of social economics. He has devoted much time and research to the matter of valuable and not easily ascertained information. The serious reader cannot lay this volume aside without feeling that here is an important contribution to the study of a subject which is of prime importance to the national welfare and good name of the American people. . . . It is the most thorough-going and complete discussion of the theme that has ever been published."—BROOKLYN EAGLE.

". . . His book is a careful piece of research. . . . The most important part of the book is the consideration of the present-day conditions in the South, and in this Mr. Cutler has endeavored to present more definite information and draw more accurately grounded conclusions than has hitherto been possible. . . . His results he has embodied in charts, representing them graphically. . . ."—NEW YORK TIMES.

". . . The book is sane, temperate in tone, moderate in statement, and judicial in conclusions. It is the only really valuable treatise on the subject, and is not likely to be superseded."—THE DIAL.

CUBA AND THE INTERVENTION

By ALBERT G. ROBINSON "A.G.R."

Large crown 8vo, pp. 360
Price $1.80 net By mail, $1.92

". . . A book which is destined long to figure among the most valuable materials for a comprehension of Cuba's history at a critical conjuncture. . . . The author was an eye-witness of the events that he describes, and he brought to his task a mind qualified by education and experience for the work of observation. . . . With the possible exception of an occasional paragraph, the volume consists entirely of newly written matter. . . ."
—NEW YORK SUN.

THE UNITED STATES AND PORTO RICO

With Special Reference to the Problems Arising out of our Contact with the Spanish-American Civilization

By LEO S. ROWE, Ph.D.

Crown 8vo. Pp. 280. Price, $1.30 net; by mail, $1.40

". . . Cannot fail to prove of great value to all who have occasion to inform themselves concerning the Spanish colonial legal system as modified since the American occupation of the island. Dr. Rowe has also included in his book a very useful discussion of these problems in civil government which confronted the American Administration from the first. The reader will gain from the work a broader conception and a fuller appreciation of the ability displayed by the representatives of the Washington Government in approaching these new and extremely difficult problems."
—REVIEW OF REVIEWS, New York.

Two Argonauts in Spain

By JEROME HART. *New Edition.* With 36 full-page illustrations. Large crown 8vo $1.40 *net.* By mail, $1.50.

"The fresh, vivid impressions of a keen observer who possesses the rare faculty of being able to 'skim' successfully, to get the best quickly and instinctively, and give it forth again with none of its charm impaired, this represents the work of Jerome Hart in an interesting little volume which he writes upon a recent journey and calls 'Two Argonauts in Spain.' . . . New points of view upon old-time topics are presented, and the book presents a distinctly pleasing phase of a short sojourn in that interesting country. . . ."
—CHICAGO DAILY NEWS.

". . . Mr. Hart is a keen observer, and he has a happy knack of getting at facts that the ordinary statistical chronicler would miss. His volume is bright and chatty, without losing in dignity, as a picture of the Spanish people of to-day—their peculiarities, customs, and manners, and it is the work of a cultivated man of the world, who records his impressions with thorough good nature without being blind to their national shortcomings or national virtues."
—BUDGET & BEACON, Boston.

"Anyone intending to make a journey through Spain will do well to secure a copy of a practical narrative by Jerome Hart. . . . On the whole he is a pleasant and profitable guide. The numerous pictures are a great addition to the book, and a map upon the inner cover is an inspiration to those of us whose minds refuse to retain details of geography. . . ."
—CHRISTIAN ADVOCATE, N. Y.

THOMAS Y. CROWELL & CO., New York

The Nation.

NEW YORK, THURSDAY, AUGUST 3, 1905.

The Week.

If Mayor McClellan goes off on his vacation stuck full of Jerome's arrows, he has no one but himself to blame for offering so fair a target. All that the District Attorney has done is to apply to Mr. McClellan the standards of a gentleman and a truly disinterested public servant; and if the Mayor endures the test badly, it is not Mr. Jerome who is at fault. The latter has simply come forward again in the old guise which so endeared him to the people—that of a man who looks neither to right nor left, but speaks the truth let who will be hurt. In one burst of indignation he blows away the excuse put forward in the Mayor's behalf that he is "doing the best he can." A gentleman and a scholar—and taking orders from Murphy! The sworn guardian of the public interest, and allowing the saloons to empty themselves into public office and even into courts of justice! Mr. Jerome has shown us precisely what Mayor McClellan and President Roosevelt really mean when they say that they dicker and compromise with corrupt bosses, and knuckle under to them, all for the public good and as a way of doing "the best possible under the circumstances." They mean their own good, their own hold on place and power, their own renomination and reëlection.

Not content with denouncing in private and out of office the "group of men" or "the single man" standing between the public servant and the voters and dictating or selling nominations, the District Attorney, who confesses that he would like another term of office, spurns the bosses before whom others are grovelling for favors, and turns directly to the people. There is a sagacious bravery in this, a calculated recklessness, which of itself lifts and lights up the whole municipal campaign. What Mr. Jerome has done is simply to return to the good practice of an elder day. Ambitious men used not to hesitate to announce their candidacy. In the generation when the career open to talent did not mean an opening into a boss's back room, men of mark were in the habit of notifying a given constituency that they were prepared to "stand" for the honor of representing it in Legislature or Congress. But of recent years candidates have not stood; they have crawled. They have gone on their bellies and eaten dirt. The old way of offering one's self for the public inspection and the free canvassing of the people has been abandoned for that of secret intrigue, machine manipulation, debasing or disgraceful bargains, compromising with the devil. Mr. Jerome states but the simple truth when he says that any one who obtains office at the hands of wicked party bosses is "under implicit obligations which cannot honorably be disregarded. He cannot take office by their favor and still be free to deal with them and their demands as obedience to his oath of office requires." For himself, Mr. Jerome will not submit to those fetters, and makes his appeal over the heads of the bosses straight to the people. If they want him for District Attorney, they may have him. Murphy and Odell need not be consulted. Nothing just like this—nothing so bracing and cheering—has been heard in this city for years.

If his clear and bold statement leaves one regret behind, it is that Mr. Jerome seems to make his nomination as Mayor impossible. Time may bring a change in that respect; but meanwhile we must not forget how vastly important he has made the office which he holds. Besides attending most efficiently to its routine work, he has made it in a peculiar sense a refuge of the oppressed and outraged. It is a wonderful tribute to the respect which his fairness and his honesty have inspired, that the threat to "go and tell Jerome" has been a bar to evil deeds all over this city, but especially in the regions where the poor dwell. And in many matters which might almost be called works of supererogation—in detection and prosecution and punishment of insidious offences, in making himself a sort of general referee, in standing as a kind of moral watchdog of the community—Mr. Jerome has given the District Attorney's office a power and significance quite unique. To retain him in it in preference to some dull tool of the Tammany or the Republican machine, is of incalculable importance.

Secretary Bonaparte has joined Secretary Root in denouncing municipal thieves who masquerade as Republicans. In an interview in the Philadelphia *North American*, he said that the man who is in politics simply for what he can get out of it "really belongs to no political party at all," and that the "professions of party loyalty" of a detected political grafter are simply "aggravations of his offence." Mr. Bonaparte is a Republican, but he is as unwilling to have the sins of the Penrose machine in Philadelphia charged up to his party as he is to accuse the Democratic party of responsibility for the performances of alleged Democrats in Baltimore. It is for honest men in both parties to scourge out the thieves of either. Secretary Bonaparte was in complete agreement with Mr. Root that the Philadelphia criminals should be prosecuted relentlessly, and sent to jail if possible. He added, with mingled humor and good sense: "My own idea always has been that it is better for genuine reform to turn the rascals out of power first, and put them in the penitentiary afterwards."

Gov. Warfield of Maryland has discovered that the figures in the State printing bill, passed at the last session of the Legislature, were raised without authority from $18,000 to $25,000, and is said to be "hot on the trail" of those responsible for the change. State Senators and members of the House of Delegates are being routed out of their summer retreats to tell what they know about the history of the printing bill. The chief engrossing clerks are being rigidly questioned, and it is generally said that the measure, though signed by the Governor, will not stand. Maryland lawmakers are the more concerned over this "error" because of the discovery some time ago that a county primary election law had been tampered with in transit between the Legislature and the Governor. In that case some one slipped in the provision that every "delegate," instead of every "delegation," to a convention should be taxed $10, and that an intending voter might ask assistance of the election judges "for any reason." Though signed by the Governor, this law was held by the State courts to be invalid. Compared with the disclosures of crookedness in other State legislatures, Maryland might seem to be excited over a trifle. But it is a good thing when a State is unable to distinguish between petty and large when it comes to stealings.

Senator Mitchell of Oregon has been sentenced to six months in jail, in addition to a fine of $1,000. True it is that the Senator's counsel announces an appeal to the Supreme Court of the United States, and that the Portland court granted a stay for that purpose. But the chances are that in the end the Senator, septuagenarian though he be, will find his way behind the bars. As it stands, the value of this conviction is enormous. It will long be remembered that a jury in Portland did its duty, and that a judge pronounced sentence without regard to the fact that the man before him was the most influential politician in his State. There must be considerable uneasiness among certain

Western Senators also interested in public land deals, as they read of Mitchell's sentence, lest they too should become intimately acquainted with surroundings very different from those of the Senate Chamber.

That edifying spectacle on which most of the country longs to feast its eyes—a Trust magnate behind prison bars—may actually be witnessed to-day. In the county jail at Lacrosse, Kan., there languishes a man who is certainly the first culprit imprisoned under the Kansas Anti-Trust law, and is believed to be the first man who ever served a prison sentence for violating any anti-Trust law. He was the secretary of the Kansas Grain Dealers' Association, and was arrested in 1902 on the charge of having formed a pool among the millers at Bison. His case was carried all the way to the United States Supreme Court, but unsuccessfully, and the Governor sternly refuses a pardon. Now the farmers of the county, which has 6,134 inhabitants, all told, are arranging excursions to Lacrosse so that they may gaze upon their one-time oppressor in durance. One could wish, of course, that the first victim of the people's righteous wrath might have had a more conspicuous career as an oppressor. We doubt, in fact, if the name of E. J. Smiley has anywhere been a household word. But even the smallest bun is better than no bread, and the taunt that no Trust promoter is ever deprived of liberty has in Kansas lost its sting of truth.

"The American people are worth serving," declares Secretary Wilson. So they are; but that they have a right to engage and retain or dismiss their servants is another proposition equally indisputable. The Southern Cotton Association, which first charged "leaks" in the Statistical Bureau, and whose president is now taking the lead in asking for Mr. Wilson's retirement, is able to make a rather impressive showing. The Secretary treated the original allegations of rottenness in his Department just as the Postmaster-General of three years ago did the Tulloch charges. He ridiculed them; and it was a real tribute to him that the public so generally accepted as perfectly satisfactory his assurance that everything was as it should be. It is now made known for the first time that, since taking office, the Secretary has summarily dismissed 290 employees, 107 of them on formal charges. It has not yet been announced, but it should be without delay, what were the grades of these culprits and their offences. It is conceivable that stern supervision of underlings might co-exist with extreme laxity as regards the more responsible officers. And, while the record shows that Mr. Wilson does not deserve the reproach of being entirely blind to faults among his subordinates, it does raise the question why, having discovered something like thirty-six derelictions a year on the average in his Department, he did not proceed to a still more thorough house-cleaning.

Last week's *Army and Navy Journal*, in commenting on the *Bennington* explosion, speaks out plainly about the deterioration of the Engineer Corps of the navy since its amalgamation with the line in 1901. The new order of things, it says, "quite unintentionally, of course, has impaired engineering efficiency throughout the navy"; and it adds that "the hope of building up an adequate engineer force from the warrant machinists has not been realized." The *Journal* also reports that engineering duty has not grown popular with the line officers, as the author of the bill, Mr. Roosevelt, and others, hoped it might. It finds that the young line officer detailed to the engine room is all too apt to perform his duty in a listless and perfunctory manner. This service paper also remarks that, while the amalgamation ended the long dispute between engineers and line, its "permanency is not altogether certain." Incidentally, the *Journal* thinks that there ought to be a free and full discussion of this old problem by the officers of the navy. This, however, is forbidden by an order of which the *Journal* says: "There never was a more unjustifiable application of the muzzling process in any navy of the world"—a statement which merits prompt attention from Secretary Bonaparte.

In a letter to the Portland *Oregonian*, Senator Heyburn of Idaho reaffirms his opposition to the forest-reserve policy of the Government. He says: "I shall carry this question into Congress with the determination to continue my opposition to the policy of the Forestry Bureau, as indicated by its action in Idaho, until these forest reserves are open to settlement for *bona-fide* homesteaders." We suspect, however, that it is not Senator Heyburn's solicitude for the homesteader alone that inspires him. When, last winter, a movement was set on foot to divide Kootenai County, an area about equal to the State of Connecticut, it failed in the Idaho Legislature because it could not be shown that the population was sufficient to support two county governments. The homesteader had not been attracted. On the other hand, the lands in Idaho which the Bureau proposes to reserve are covered with valuable timber which the lumber companies would like to secure, and this fact supplies a motive for Heyburn's bitter opposition. He and his kind, who have adapted the old exhortation so as to make it read, "Grab, saw, and sell to-day, for to-morrow we die," are utterly unable to fathom the motives of men like Chief Forester Pinchot, whose talk is all of preservation, reforestation, and the influence of forests on rainfall. Naturally, Senator Heyburn is indignant at the report that he had slackened in his fight for the poor Idaho homeseeker—and the land-grabbers.

The appearance of yellow fever at Tampa and its spread in New Orleans recall the fact that it was not to the men of New Orleans, but to its women, that the city owes the drainage and sewer system which it possesses. The men were too much concerned with business to give their attention to this vital matter, and so their wives and sisters were forced to arouse public sentiment and obtain the necessary appropriation. It is characteristic of all our coast cities, too, that as soon as trouble is at hand there is a demand that the Federal authorities come to the rescue. When all is well, there is no end to the talk of State sovereignty in quarantine matters. But the instant that yellow fever or plague or cholera appears, there is a cry for national aid and leadership. Unquestionably, the epidemic in New Orleans will bring up afresh the whole question of Federal sanitary control of our harbors. Only we shall go about it shamefacedly this time, realizing, we hope, that Cuba may feel a grim bit of self-justification at the sight of our dilemma. Consider the outcry and the reproaches of our press if yellow fever were making such ravages in Havana. By our official attitude in forcing hygienic stipulations into the Platt amendment, we committed ourselves to the view that yellow fever is a filth-disease; that nothing but criminal indifference can allow it to invade a city, and that the United States would be justified in forcibly interfering in Cuba if she did not keep her ports free of the disease.

The insidious character of tariff burdens comes up every now and then for exposure. A distinguished publicist is reported to have said that it is highly probable that even a very thoughtful toper does not taste the tax in his whiskey. But this is far from certain. On Thursday, at the annual convention of the Coöperative Savings and Building Loan Associations at the Murray Hill Hotel, a delegate presented a paper entitled "The Tariff Tax on Homes." Mr. Leubuscher, the author, contended that the tariff on building material served at the same time to swell the profits of Trusts, who sold the same materials at lower prices abroad, and enhanced the cost of building modest homes in this country. He computed the increase in rentals caused by the tariff at something like 20 per cent. more than it otherwise would be. Of course, the

Pennsylvania delegates protested against this view. The tariff, according to them, puts us all on a higher plane of prosperity, and so enables us to afford the higher rentals. However, it has never yet been demonstrated that the tariff jacks us all up to the same extent upon the higher plane of prosperity. Surmise, moreover, is busy over the prospect of the distance we shall all have to drop when the artificial, all-round process of everybody's lifting everybody else by the bootstraps stops. It is certain that some day every tub will have to stand on its own bottom.

Superintendent Kilburn does not figure particularly well in the matter of the German Bank of Buffalo. In his answer to the committee of creditors, Mr. Kilburn admits that, after the bank had been closed as insolvent, last December, he reopened it for part of a day, then closed it again. During the period of reopening, $355,000 deposits were withdrawn—necessarily to the prejudice of other depositors. The excuse for the reopening is not especially convincing. Mr. Kilburn had appealed to the directors to advance the funds required to save the bank, and they had not responded. The Buffalo Clearing House had refused assistance. Yet the bank, says the Superintendent, "was reopened on Monday morning in order that the directors might not be in a position to say that I gave them no opportunity to support the bank and save it from ruin." In view of the fact that the institution was already insolvent, this apology will impress the banking world as extremely flimsy. It is quite of a piece with the Department's policy in the Merchants' Trust affair, when a bankrupt institution was knowingly allowed to go on doing business for a year or more, in the cheerful hope that some way of realizing on its assets might turn up. The Superintendent failed entirely, in both instances, to recognize the fact that his office was created to protect primarily, not the officers and shareholders of the bank, but the depositing public.

Insurance Commissioner Cutting of Massachusetts, whose authority in the ranks of insurance experts is high, has taken up the Equitable scandal in his annual report. In so doing, he carries his inquiry into the causes of mischief beyond the mere question of negligence or corruption in this one great institution. His analysis of the true meaning of the moral downfall of the Hydes, the Alexanders, the Depews, and their numerous confederates, is striking. It repeats, indeed, the conclusion to which most thinking men have come, that the Equitable rottenness was not much more than an incident in the financial methods and practices of the day—exposure in that one case, as Commissioner Cutting himself points out, being a result more of accident and of an internal quarrel than of any effort by the public to learn the truth. The Commissioner's comments on the situation, from the life-insurance point of view, are trenchant. He criticises unsparingly the entire system of "deferred dividend policies" out of which, in his judgment, the malign possibilities of the Equitable situation grew. He describes this policy as a "demoralizing form of contract which is responsible for a large part of the evils of life insurance, and which ought to be prohibited in every State for a longer period, without an accounting, than five years, as has been done recently by the Legislature of Wisconsin. It is, he holds, a direct provocative to extravagance, waste, and corruption, and is favored by the great life companies, in his opinion, because the system "supplied such enormous accumulations, which can be used for expenses and the policyholders be none the wiser until their deferred-dividend periods have expired." Naturally, control of huge sums of life-insurance capital for selfish purposes and schemes could not fail to be facilitated by this system. "That the ethical standard was lowered amid such conditions . . . is an indictment not merely of the accused," but of long-current business practices.

One risk which the Kaiser took when he assented to an interview with the Czar was that any hitch in the movement making for peace would be imputed to Germany. There is a section of the British press and people profoundly Teutophobic. It is not surprising that this contingent already sees the malevolent hand of the Kaiser in the present trend of affairs in Russia. The Czar's assurance to the Orenburg clergy that he will never conclude "a peace shameful to Russia," is distorted to mean that the Kaiser begged the Czar to continue the struggle with Japan. The raiding of the houses of the officers of the late Zemstvos' executive committee and the seizure of their papers are interpreted to mean that the reactionary policy of Russia has been taken up anew at William's insistence. "Once again," says a cablegram from St. Petersburg to London, "Germany appears destined to play the part of Russia's evil genius." Since the publication more than twenty years ago of that clever sketch, 'The Battle of Dorking,' describing an imaginary invasion of England and its subjugation by Germany, there has been nothing that so "gets on the nerves" of John Bull as the German Peril. It unfortunately presents a possibility by which an unscrupulous Prime Minister who thought more of keeping in office than of his duty to his country, could build up and solidify his majority in the House of Commons. It is only fair to say that Mr. Balfour has hitherto resolutely refused to play with fire of this kind.

Among the minor signs of Mr. Balfour's impending fall is the growing levity or disrespect of the press—even the Tory press—in dealing with his misfortunes. When *Punch*, still the favorite of the aristocratic party, takes to caricaturing a Conservative Premier, it shows how small is his expectation of political life. Still more ominous is the changed tone of the London *Times*. This thick-and-thin apologist of the powers that be is beginning to scold Mr. Balfour almost shrilly. Referring to his fiasco in the matter of redistribution of seats in the Commons, it said that he had "given his Government a harder knock than the Opposition had been able to inflict," and added that "there is something ridiculous in the spectacle of a Government embarking in this light-hearted way upon an important enterprise without taking the most elementary precautions." When his followers cheered their leader next day, the *Times* said that this was certainly "generous" in them, after his "Parliamentary mismanagement." It appears to be true that Mr. Balfour told his party, in his confidential speech to the rank and file at the Foreign Office, that he would resign at once were it not for the delicate posture of foreign affairs. This confirms the justice of a remark made by a predecessor of Mr. Balfour's in the Premiership: "After a short term of high office, the holder almost invariably thinks himself admirably fitted for it."

While indemnities are being determined upon and passed around gratis, as it were, China has resolved to put in her own modest little claim for $100,000,000, or thereabouts, for damages done to Mantchuria by the contestants. China has also notified the Powers that whatever may be the peace terms arranged at Portsmouth, Mantchuria must be restored to China intact. Perhaps these pronouncements are mere bluffs, intended, as some diplomats think, to indicate an assertive foreign policy on China's part. Or they may be based on an Oriental notion of equity in that some remuneration may fairly be due to a neutral whose fields have been trampled and whose villages have been destroyed by the struggles of others. The warrant for China's reimbursement would seem better grounded morally if it could be shown that China had not virtually abandoned the *de facto* administration of portions of Mantchuria before the actual campaigns began. It is also probably true that the Chinese claims would stand a better chance of recognition if the military and naval power of the Flowery Kingdom were not as yet so despicable.

THE PERSISTENT DEFICIT.

The first month of the current fiscal year ended on Monday. It yielded a handsome addition to the steadily growing deficit of the Federal Treasury. Even discounting the heavy disbursements that are normally made in July, the adverse ledger balance of something like $14,000,000 for the month must give us pause. A slightly larger shortage for July, 1904, was the precursor of a deficit of approximately $24,000,000 for the fiscal year that closed but a month ago. What are the Administration's plans for meeting this impending danger?

From the Executive we hear little or nothing. President Roosevelt has never professed more than a slightly contemptuous interest in finance. Except for occasional and highly abstract praise of economy in his messages, he has hardly taken up the national finances in a serious way. His interest is rather wrapped up in the objects on which he would like to spend money. "Let me only name the subjects of appropriation, and let who will frame the revenue-raising measures," seems to be his song. From Secretary Shaw we get almost as little light on the situation. He has become of late only a sort of glorified accountant. His failure to guess the size of last year's deficit was explained as a "clerical error," and it is commonly understood that he is only a *locum-tenens* anyway. The Shaw Presidential "boom," it might be guessed, could hardly be inflated by projects for lessening the Treasury deficit. His favorite device on the stump—"Sing 'America'" —will not conjure coin into the vaults. He reminds one of Vansittart, the Chancellor of the Exchequer who sat by the pool of a "bottomless deficiency, fishing for a budget."

The only sign of appreciation of the gravity of the business, or of leadership to apply a remedy, is found in the Congressional paladins, especially Mr. Cannon. The prospective Speaker no sooner appeared in Washington than a plan was unfolded to meet the difficulty. Mr. Cannon is talking "economy," and to that end will select a chairman of the Appropriations Committee who will have to take a solemn, cheese-paring oath. Mr. Allison in the Senate will cooperate. The plan is to wipe out the deficit by operating solely on appropriations. All revenue legislation, such as restoring Spanish war taxes or laying sacrilegious hands on the Dingley schedules, is to be avoided. Mr. Cannon is said to feel that any revenue legislation, if mooted, would bring tariff revision so strongly to the fore that he could not bottle up again the genie now confined in the Dingley bottle.

Of Mr. Cannon's plan it may be said that it is an example of the good being an enemy of the best. Economy is welcome from any quarter, but not the economy of the penny-wise, pound-foolish variety. Moreover, Mr. Cannon's scheme, ingenious as it may be as a quietist movement, does not go to the root of the matter. Besides neglecting the possible shrinkage of customs receipts which cannot be presumed to keep forever at the present level of $262,000,000 per annum, the scheme will be wrecked because it neglects the ever-growing demands of our insatiable policy of Imperialism. *It cannot be made too plain that the one preponderating cause of our swollen expenditure and of our chronic deficits is the unheard-of augmentation and swollen outlay on army and navy.* The "raids on the Treasury" which Mr. Cannon is going to head off are petty matters in comparison with the constant demand for a huge navy. Even pensions have fallen astern of the ever-growing cost of the mailed fist. The following table (in round hundreds of millions) will elucidate the matter:

EXPENDITURE (FISCAL YEAR).

	1897.	1904.	1905.
Civil and miscellaneous	90	*186	146
War	48	115	122
Navy	34	102	117
Indians	13	10	14
Pensions	141	142	141
Interest	37	24	24

*Includes $54,600,000 for Panama Canal and Louisiana Purchase Exposition.

Even the new method of tabulating expenses which the Treasury has strategically adopted, and which will lessen the totals under War by charging to public works and buildings a part of the outlay previously assigned to War, cannot disguise the facts. The necessary expense of the Spanish war has served to dupe the country or lure the country into bearing the present enormously swollen outlay, especially on the navy.

A weather-wise financier who looked ahead not only beyond the present year, but even beyond the next election, would take due heed of another element in the situation. Declining business activity is always quickly reflected in a lessened yield from indirect taxes. When the next slump comes, the present deficit will grow by leaps and bounds. The past two years have been years of plenty, and the curiously constant receipts of the Treasury may well be held to be the maximum our present revenue laws can bring forth. Thus, the Treasury's income for the past two fiscal years has been made up as follows:

	1904.	1905.
Customs	$262,013,079 07	$262,060,528 14
Internal revenue..	232,873,721 48	233,464,200 89
Miscellaneous	46,628,843 85	47,899,130 21
Total	$541,515,644 40	$543,423,859 24

Failure to allow for a marked abatement in revenue when the hour of declining fortune strikes, is hardly less than financial blindness. If the withdrawal of a fraction of the Treasury's balances from the national banks must be carefully planned to avoid difficulty, one can guess what a sudden and sweeping withdrawal of those balances, prompted by dire necessity, would occasion. The present is the time to provide against the recurrence of deficits; but so long as extravagant policies are continued, unjust and oppressive revenue laws continued in force, and only surface remedies applied, the problem is not only not solved—it is not touched.

NOT LETTING IT "BLOW OVER."

"After this disturbance blows over," said Senator Depew, on landing with a little less than his accustomed joviality on Saturday, "the Equitable will be the same as before." So will everything else, he implied—characters and confidence will be restored, though they seemed lost forever, and it will be a merry world again. The Senator is a proved expert in the art of forgetting. It is essential to his peculiar brand of optimism. One who has before been known to retire into his cyclone cellar, to emerge triumphantly after all has blown over, may be excused for imagining that simply lying low a short time will make people forget even such a scandal as the Equitable's. But hot anger makes good memories; and we believe that any man concerned who thinks to set all right by a discreet hiding of his head in the sand, is pretty certain to have the *vis a tergo* of Carlyle's famous figure applied to him.

The very worst advice that could be given to Americans to-day is to shrug their shoulders and hasten to forget the revelations of rottenness in both their private and their public business, which have cut them to the quick. It may not be pleasant, but it is wholesome, to keep the eye fixed upon all this sorry affair—to see corruption steadily, and to see it whole. *Memento* in large letters should be written up at the bed-foot of every professional optimist who hopes to sleep away the whole thing and rise in the morning radiantly forgetful. It is one of the marks of a fool to refuse to consider his folly or to profit by his past mistakes; and if we wish to be set down as a foolish nation, we shall make haste to push aside as ancient and irksome history the records of our disgrace. To be able to keep angry six months has been offered as a definition of good citizenship. It is certainly the sort that these times call for. We do well to be angry with those who both have taken our purse and robbed us of our good name; and every time that a smug Depew exhorts us to think of the good time coming when all this will have blown over, honest men should sternly point to the bad time present, with an indignant "Lest we forget!"

A sharp jog to the memory was given by the Attorney-General on Monday in his announcement of suits against the whole board of Equitable directors. There appears much to commend in his

statement of intended procedure. He is not to bring suit under the vexed clause 36 of the Insurance law, forbidding a director or officer of an insurance corporation to "receive any money or valuable thing for negotiating, procuring, or recommending any loan from such corporation." As Attorney-General Mayer says, this clause has never been construed by the courts, and "its meaning is, from a lawyer's standpoint, much in doubt." We have ourselves seen the clause interpreted very differently in different "opinions" that have been sought as to its intent and effect. This uncertainty is, no doubt, a strong reason why that section should be judicially interpreted at the earliest day possible, or why the Legislature should amend it so as to make its language more precise and unmistakable; but it also constitutes a valid argument for the Attorney-General's proceeding under some other law, if he finds one available and adequate.

He has, in fact, elected to bring suit under section 1781 of the Code of Civil Procedure. This provides for actions to compel directors to "account for their official conduct in the management and disposition of the funds and property committed to their charge"; also, to "pay to the corporation which they represent, or to its creditors, any money, and the value of any property, which they have acquired to themselves, or transferred to others, or lost, or wasted, by a violation of their duties." Under this broad grant of power, it seems clear that the Attorney-General may compel a searching judicial inquiry into the whole Equitable scandal. Individual and official responsibility can be rigidly inquired into and legally established, while personal liability to make restitution, or to be criminally prosecuted, may be fixed by the courts. The power both to investigate and to punish seems ample, if it be boldly employed.

One obvious advantage of the method of a sweeping inquiry, such as the Attorney-General proposes, is that it will apportion blame. Though all the directors are to be sued, it is not contended that all are alike guilty. The action should clearly bring out the shades of guilt. If certain of the directors have profited personally by virtue of their trust relation to the Equitable, that will be made to appear, and separate suits, civil or criminal, may then be brought against them. If others have been simply negligent, and have allowed mismanagement, extravagance, and unlawful diversion of funds to go on without due diligence in preventing it, the courts will settle the extent of their liability. As the Attorney-General states, the suits which he is first to bring will include both those directors who have "done active wrong" and those who have "neglected their duty." The result cannot well be other than to get such a judicial determination of the responsibility, and the accompanying obligations, of a director of a great corporation as we greatly need. If the courts are able also to decide in what sense the surplus belongs to policyholders—whether for mere purposes of tax-dodging or for their actual benefit—so much the better.

The great thing is that legal machinery is at last to be set in motion. We are not to let all this blow over with our criminal American good nature. Somebody is to be arraigned. Somebody, we hope, is to be made to smart. Unless our State and county prosecuting officers are able to bring some of these rich swindlers to justice, we shall have to transpose the nots in the definition of the law, so as to make it read: "The very least *not* feeling her care, and the greatest exempted from her power."

MILITARISM IN TROUBLE.

Addressing Parliament recently in behalf of his proposal to reform the British volunteers, Mr. Arnold-Forster, the War Minister, admitted that Lord Roberts and other officers high in the army believed universal military service to be the only remedy for England's military ills. He added significantly: "Well, neither Lord Roberts nor I have any commission to impose upon the people of this country conscription, and I think it is not wise to plan your remedies upon the supposition that this particular method of filling up your army will be adopted by the people of this country." No minister could more frankly admit that conscription is as hopeless in England as it is in America. There was a time, after the Boer war, when the chagrin of the English public at the military blundering in South Africa made compulsory service loom up in the political horizon as a possibility. It was only for a moment. No Prime Minister, however Imperialistic, would dare to urge it. Instead, we have a harking back to infant rifle clubs—to the old picture of England defended by butchers and candlestick-makers lying behind hedges in the dress of militia or volunteers. Kiplings may rage as they please, Robertses and Kitcheners make the welkin ring with their demands for a government more devotedly military—the British electors will have none of it.

As a result, the struggle in England is to improve the citizen soldiery. Japan has led the way with hers; why should not England follow on? True, history fails to record infant inhabitants of Tokio spending half their childhood at the butts, but none the less the volunteers are uppermost in the hearts of the English ratepayer, as Mr. Arnold-Forster found out when he tried to improve them by cutting them down in numbers—"weakening and ultimately ruining" them, his opponents called it. But the Secretary for War was not content with refusing to consider conscription at home. He had something to say about its working abroad. It was, he observed, becoming "less and not more popular" on the Continent of Europe. "The bow is being very tightly drawn," and for this reason also it was idle to think of the principle of universal military service being planted in English soil. Mr. Arnold-Forster was correctly informed. Those nations which have had their strongest bulwarks in conscription, are not of late quite so sure of themselves and their strength. This is not merely because of the spectacle of thousands of unwilling Russians being butchered in a cause of which they know little and care less. The increasing education of the masses has been quietly doing its work for decades past. Moreover, the development of a great industrial state like Germany sets people to thinking. The terrible sacrifice involved in withdrawing from productive employment more than 600,000 men for periods of from one to three years is becoming more and more widely understood.

But there is still another ominous symptom which is fixing attention and exciting anxiety in Europe. It is the attitude of the Socialists. An observer in Paris during the recent Moroccan excitement was struck by the total absence of a desire for war, particularly among those generally ready, in their ignorance, to toss their caps and hurrah, as did the Parisians when Louis Napoleon started for Berlin. There is about as much real cause for war in 1905 as in 1870. But there was no belligerent response from the people when the politicians sounded them to find out where they stood. The average Frenchman was perfectly satisfied; ready to let the diplomats fight it out, and quite as earnest as John Bull in his desire to be let alone. And the Socialists, from Jaurès down, would not hear at all of war. They, like the followers of Bebel in Germany, have got one truth into their heads, however much trash they may have stored away besides. It is that the burdens of war fall heaviest upon the poor man—the first to be sacrificed and the last to be asked whether he desires to immolate himself.

Herein lies one of the greatest hopes of peace and disarmament abroad; and it is not to be sneered at or ignored because it has become the cult of men who include in their creed doctrines detrimental to human progress. It is the German Socialists who speak out even louder than the Liberals in their protests against the wanton waste of treasure for the sake of militarism. When Bebel attacks the army estimates, even the Chancellor tries to brand him traitor, and the attitude of his party towards the army is watched with never abating eagerness. For the powers that

be are beginning to perceive the growing hatred of the military spirit and all it stands for, which is one of the striking developments in Germany to-day.

Lordly imperialists the world over are to be commiserated with upon this state of affairs—they who always think in terms of continents. For when the hour of sober reckoning comes, somehow there is a surprising number of Little Englanders. Lord Roberts may point the way, but what can he do when even the Prime Minister says an invasion of England is impossible? His pet bogey is gone. So we here were to have had a grand army with reserves of all kinds after our Philippine adventure. Instead, there is, after seven years, a most distressing desire to cut down further estimates for the navy, a total indisposition to increase the army, and a lamentable desire to attend to our own affairs and fall back upon our old sublime confidence that the Seventh New York Regiment can lick the whole world, including the Canadian Militia. True it is that there is to be a campaign for a coast-defence reserve, a torpedo and submarine mine corps, and what not, on the assembling of Congress. But Congressmen have small minds; they care somehow much more for the deficits which, whether here or abroad, are so ruthless in checking military ardor. As Mr. Arnold-Forster plaintively and, we fear, weakly, remarked: "Whoever sits at the table at the War Office has also to consider the question of the financial ability of the country to bear the burdens of the military defence of the country thrown upon it."

THE CASE OF NORWAY.

The present political crisis in Norway has given rise to several publications designed to affect public opinion outside of that country respecting the controversy with Sweden. Among these may be mentioned a pamphlet on the history of Norway, intended for free distribution among the members of the International Council of Women, written by Miss Gina Krog, president of the Norwegian National Council of Women; a pamphlet entitled 'The Kingdom of Norway as a Sovereign State,' by A. C. Drolsum, chief librarian of the University of Christiania; and Fridtjof Nansen's 'Norway and the Union with Sweden,' just issued by Macmillan. Miss Krog's pamphlet is published in English, Mr. Drolsum's in Norwegian and English, Nansen's slender volume in Norwegian, English, German, and French; evidence of the importance attached by the Norwegian people to the English-speaking world's gaining a correct and sympathetic understanding of their cause. Norway has for generations been unable to communicate with the outside world through official channels of her own, and her patriotic children, therefore, had to undertake the task privately. Drolsum and Nansen to a large extent cover the same ground, but the former treats his subject in a more impersonal, purely historical way. Nansen says in his preface: "I have tried to the best of my ability to state everything on the basis of the most trustworthy and most recognized authorities, and have obtained the counsel and assistance of leading men of the most divergent political views." He writes, nevertheless, in a more personal vein, not entirely *sine ira et studio*, even if he has succeeded, as he ventures to think, in framing "a neutral and reliable statement of what has happened and of what is the opinion of the Norwegian people."

His first chapter is an historical introduction of twelve pages, in the first place combating the common but erroneous conception that Norway is a young nation. On the contrary, it is one of the oldest kingdoms of Europe, for when Harold the Fair-haired, finally overcoming the petty monarchs, founded it in 872, Alfred the Great had been King of England for only a year, while the history of Sweden was still veiled in the gray mist of prehistoric dawn. It happens, too, that the earliest extant commercial treaty concluded by England with a foreign state was that made with Norway in 1217. Nansen deals briefly with those dynastic vicissitudes which in the fourteenth and following centuries brought Norway into union, first with Sweden, then with Denmark and Sweden, and finally with Denmark alone, until, by the treaty of Kiel of January 14, 1814, the King of Denmark was compelled to cede the throne of Norway to the King of Sweden.

The Norwegian people, however, while acknowledging the King's right to release them from their allegiance to him, did not propose to be transferred like cattle to a foreign potentate. An assembly of representatives from the different parts of the country was accordingly called to meet at Eidsvold, near Christiania, and this assembly, on May 17, 1814, adopted a Constitution and elected a king. This charter the Norwegian people claims has now again become operative by the failure of King Oscar to perform his duties as a constitutional monarch; and the circumstance explains why, under the present provisional government, the country is still styled the Kingdom of Norway, though temporarily without a king.

The King of Sweden, on his part, was not disposed to give up the idea of winning Norway, and Swedish troops therefore were, on July 28, 1814, sent into the country under Bernadotte. The campaign, mainly of a demonstrative character, lasted only two weeks. The only general action, on the northern wing, resulted in a victory for the Norwegian arms, while on the southern wing the Swedes took possession of a fortress which the Norwegians had already decided to evacuate and had stripped of its heavy guns; but the Swedes were unable to take the strong fortress of Fredriksten. Meanwhile, Bernadotte opened negotiations with the Norwegian Government, for reasons still debated. Some historians have maintained that, with a statesman's intuition, he foresaw that the Norwegians would be more valuable partners in a union which they entered voluntarily and on essentially their own terms, while military writers have judged the prospects of a successful campaign rather doubtful. Perhaps the attitude of the other Powers also gave occasion for some misgivings. At any rate, Bernadotte, on August 14, 1814, in the name of the King of Sweden, concluded a truce with the Norwegian Government and signed the convention of Moss, under which the Storthing was immediately to be called in extraordinary session to discuss the question of a union with Sweden and adopt such changes in the Constitution of May 17 as would be rendered necessary. This new Constitution was adopted on November 4, and on the same day King Charles XIII. of Sweden was chosen King of Norway. Contrary to the contention of some Swedish politicians and some foreign publicists, Norway entered into this agreement not as a conquered country.

The basic principle of the Union, as afterwards established by the Act of Union (*Rigsakt*) of August 6, 1815, was the equality of the two kingdoms and the independence of each in matters which did not affect the Union, or, as Bernadotte himself expressed it in 1815: "The Crown recognizes the principle of complete equality between the two kingdoms in all questions concerning their joint government." And the same equality was expressly recognized by the Estates of the Swedish Riksdag in 1815. It is to be noted, further, that the Act of Union established no bond between the two countries outside of the King's person, which guaranteed community of action on the question of war and peace. Each kingdom preserved in other respects its full sovereign entity, its separate army and navy, fiscal system, etc.

Equality was never fully carried out in practice. "We had," says Nansen, "to wrestle over the King's Norwegian title, over the inscription of our coinage, over our flag, and the arms of the kingdom." Especially in the treatment of foreign affairs has equality never been exemplified, and Norway has had to fight incessantly for a position more in consonance with the basic principle of the Union and the dignity of her people as a sovereign nation; but it is only fair to state that the royal family—apart from Bernadotte himself—have, as far as it has been within their power, considering that they had

to seek their main strength in Sweden, supported Norway's cause. Several joint committees were appointed to try to ease the friction—first, in 1839, consisting of four Norwegians and four Swedes; but its report, rendered in 1844, was pigeonholed by the Swedish Government and never acted on. Another was appointed in 1865, after several years of incessant bickering as to the abrogation of an article of the Norwegian Constitution giving the King the right to appoint a vice-regent for Norway; the Swedish Government and Riksdag having long maintained that they should be given an opportunity to express themselves as to changes even in articles of the Norwegian Constitution not embodied in the Act of Union. The report of this committee, rendered in 1867, was voted down by heavy majorities in both the Storthing and the Riksdag. The third committee, consisting of seven members from each of the two countries, was appointed in 1895 and reported in 1898, without, however, having been able to agree on any proposal—in fact, having split into two Norwegian and two Swedish factions.

Meantime the consular question had come to the fore in Norway, because both the great Norwegian political parties were agreed about the country's right to settle that question in her own way. On the initiative of the Swedish Minister of Foreign Affairs, a committee of experts from the two countries was appointed on January 18, 1902, to consider the ground of controversy. On July 26 it reported unanimously in favor of the establishment of separate consular services for the two countries. Negotiations carried on between the two governments resulted in the drawing up of a protocol under date of March 24, 1903, fixing the principles upon which separate consular services were to be arranged by further negotiations. But the Swedish Government, after having allowed nearly two years to elapse without complying with the terms of the original protocol, introduced into the negotiations several new questions which had never been touched upon in the preliminaries, and which, by the Norwegian Government and the whole Norwegian people, were pronounced tantamount to a denial of Norway's right as a sovereign nation. A new Union committee, proposed by the Crown Prince as Acting Regent, was not entertained. On the contrary, the Norwegian Storthing adopted a bill providing for a separate Norwegian consular service. When Nansen's book was written, the fate of this bill was still undecided, and in his last chapter ("The Political Situation within the Union at the Moment") he discusses what will happen in case sanction be refused.

FUSTEL AS A SOCIOLOGIST.

The recent commemoration of Fustel de Coulanges has led to an outbreak of hostile feeling eminently characteristic of France, a country where everything seems capable of being turned to political account. How such an incident confirms the views of Mr. Bodley and other censors of French temper, we shall not pause to inquire; but it may be worth the while of historians and sociologists to consider for a moment a by-product of the controversy. M. Gustave Fagniez, author of 'Le Père Joseph et Richelieu,' has contributed to the *Réforme Sociale* an interesting article on the methods and outlook of Fustel, with special reference to a possible affiliation between his principles and those avowed by the disciples of Le Play. It will be remembered that the *Réforme Sociale* was founded twenty-five years ago to promote the cause of social peace, and has, in dealing with sociological questions, taken as its point of departure the cardinal importance of tradition. Without involving himself in the disputes which have grown out of the commemoration, M. Fagniez seeks to determine whether there can be found in the writings of Fustel any trace of a fixed attitude toward the main problems presented by sociology.

We may as well say at once that this is not a discussion of the well-worn arguments regarding the scientific status of sociology, but rather a definite inquiry as to the individual views of a most eminent historian. Every one who is at all familiar with the life and works of Fustel will remember the enthusiasm with which he advocated the dogma that history is a science, having laws of its own and holding a high place in the realm of exact knowledge. In the obituary notice of him written by M. Gabriel Monod for the *Revue Historique* there appeared the following anecdote: One day while Fustel was lecturing, his class broke in with applause. So far from accepting this token of appreciation as a personal compliment, he simply said: "Do not applaud me. It is not I who speak, but History that is speaking to you through me." All his deliberate utterances were marked by the same conviction. A patient and thorough study of the texts must lead to assured results, and disclose the nature of the process whereby man has advanced from age to age since the beginning of authentic records. It was indeed the process rather than the individual that Fustel cared to investigate. Even the heroic and overmastering personality of Charlemagne sinks from view in his account of the social and legal forces which controlled European life during the eighth century. Looking at man in the mass, his attention became concentrated upon institutions and their growth. Of all Darwin's contemporaries not one applied more closely than he the idea of evolution to the explanation of historical phenomena.

A curious passage in Fustel's will gives us an inkling of his attitude, both towards religion and towards man's spiritual relation with the past. "I desire," he said, "a service conformable to the usage of the French—that is, a church service. It is true, I am neither a communicant nor a believer, but I must not forget that I was born in the Catholic religion, and that those before me were also Catholics. Patriotism demands that even where one does not think as his ancestors did, he should at least respect what they have thought." Whether the Roman Church has cause to feel much satisfaction in being asked to perform a service on such terms may be doubted. Here we are only concerned to point out the sense of continuity which made tradition so large an element in Fustel's life and thought. He was not a believer, but many of his readers closed the 'Cité Antique' in full confidence that its author was a sincere Christian; and, according to M. Fagniez, his friends felt called upon in 1878 to let the Government know that he was not a clerical. Thus, while it was impossible to make out from his books what his private views were, no trace of harshness marked his attitude towards an ecclesiastical system whose growth he associated with an unfolding of the human mind.

Fustel, though not a sociologist by label, was, in M. Fagniez's opinion, a true fellow-worker with Le Play, whose disciples may derive material from both the 'Cité Antique' and the 'Histoire des Institutions Politiques de l'Ancienne France.' The 'Cité Antique,' tracing the development of the State through family life to a belief in the tutelary guardianship of dead ancestors, insists, with all the more force because it is not an argument, upon the determining effect of social forces. The solidarity of generations, the slow transformation of human qualities, the omnipresence of similar instincts are for Fustel the fundamentals of a system; and because he has a system in which collectivity, not individualism, is the ruling word, he draws close to the sociologists. In his mind the present was never divorced from the distant past, and his whole philosophy of history had for its starting-point the primitive custom out of which the modern institution has been evolved by the widening of the general consciousness. To the ordinary reader his distinctive conceptions will seem to stand out most strongly in the 'Cité Antique.' Yet, if one will but read between the lines, they are hardly less visible in the 'Histoire des Institutions.' As M. Fagniez points out, this work was separated from its predecessor by ten years and the Franco-German war, and lacks also the manifest unity of motive of 'La Cité Antique.' Yet, under grave differences of form, the two books are linked together by the strongest of intellectual bonds, an identity of outlook upon the process of social evolution.

Fustel acquired from Jules Simon a habit of mind which led him to question all conclusions that had not stood the test of rigid criticism. Hence, when he approached the study of the early Middle Ages, with its chief subjects in the contact of Roman and German, the status of the Church, and the origin of feudalism, he found it necessary to clear away a whole mass of reigning theories. Chief among these was the idea of an ancient racial antagonism between provincial and barbarian, followed by a contest of national enmity between Austrasia and Neustria. Nor did Fustel show himself less severe to prepossessions regarding the conflict of classes within the West Frankish realm. Avoiding all temptation to write the history of the sixth and seventh centuries in the light of the French Revolution, he looked for the facts as the texts

have preserved them, and made it a matter of religion to banish all inherited prepossessions from his mind. In his volume on 'Roman Gaul,' he says: "History is not an art of discussion apropos of facts; it is a science whose object is to find the facts and present them clearly." And again, in his volume on the 'Frankish Monarchy,' he comes back to the same position in the words: "History is a science; it does not imagine; it only sees."

From the remarks of M. Fagniez upon Fustel's principles and methods as an historian, it is not difficult to see why he should conclude that the sociologists have an ally whom as yet they have seldom claimed. One might even say that the features of resemblance are those of kinship rather than of alliance. Fustel was at one with the sociologist in giving individual leaders slight credit for determining the direction and pace of human progress. With the main contention of the sociologists he was also in accord, for how could one who claimed for history the character of a science, and held that social phenomena in the mass were more important than the most shining of private achievements, exclude sociology from fellowship with the sciences? If sociology had been called in his presence "our old foe, the philosophy of history, in disguise," he probably would have replied: "No; it is not an offspring of metaphysics, since it deals with human experience under its least capricious form—the life of communities, the efforts of collective man."

Familiarity with a wide range of social phenomena helps to soften the asperities of party hatred, religious intolerance, and social prejudice. The conception that both ideas and institutions represent but a phase in a long, unceasing train of historical evolution, is among the most fruitful ideas of our time. The impossibility of divorcing one's self from the influence of tradition is beginning to be recognized even by the radicals of more moderate aspiration. But when it comes to the theory of historical generalization and the statement of social laws, one may well doubt whether the views of Fustel and the sociologists will ever command universal assent. What is the part of hypothesis in historical interpretation? Can the imaginative faculty be eliminated by any investigator of the higher type, however much he may deplore and guard against its excesses? What do the selection and accentuation of certain facts to the exclusion of others mean but an assertion of private judgment? Were there any need of citing contrasted opinions upon these issues, we might place side by side with Fustel's doctrines the criticism that Mr. Morley has recently passed upon Professor Bury in his review of Frederic Harrison's 'Theodora.' But, for the present purpose, we need not go beyond the works of Fustel himself. M. Fagniez, after citing his somewhat disparaging allusions to Tacitus, continues: "In fact, Fustel de Coulanges was less exclusive than he wished to be. He did not forbid conjectures; only he always presented them as conjectures." Fustel and M. Fagniez are alike sincere in making this distinction between avowed hypothesis and assured fact, but scholars from beyond the Rhine will tell you that many of his statements are in truth hypotheses. He had a strong imagination, though he sought to prohibit its exercise; and much of his best work derives its value from the strength of his imagination in its interpretative form.

Another point of equal importance remains. M. Fagniez tells us that though Fustel did not expel hypothesis from the realm of history, he used it rarely, and under no circumstances would allow special influence to individuals as distinct from the anonymous coöperation of crowds. Here, one must believe, his dogma will fail to carry universal conviction, for if Carlyle was rash in obliterating the multitude for the benefit of demigods, it is a task more hopeless still to wipe out the great man altogether. If Fustel and the sociologists demand this sacrifice, they may indeed exact it from enthusiasts, but from the generality of thinkers, never. M. Fagniez for one admits the validity of a different standpoint in the following words:

"On peut certes la [l'histoire] comprendre assez différemment, on peut croire que les grandes évolutions historiques ne s'accomplissent que quand elles trouvent, pour les mener à bien, un homme ou des hommes supérieurs, capables de diriger les sociétés vers la réalisation des réformes, des transformations dont elles éprouvent le besoin sans posséder l'art de les faire réussir; on peut même soutenir que l'influence de ces hommes supérieurs peut aller, par l'exploitation habile des instincts, de l'ignorance et de la crédulité populaires, jusqu'à conduire les peuples là où ils ne veulent pas, où ils ne pensent pas aller."

We must reiterate in conclusion the belief that sociological studies, while they may qualify to some extent our inherited notions concerning the value of leaders and leadership, will never destroy the spirit of hero-worship. But, for Fustel de Coulanges, history had its sole meaning as a process of collective development.

THE EXHIBITION OF MEZZOTINTS AT THE BRITISH MUSEUM.

LONDON, July 20, 1905.

Different ages have found a different medium for their portraiture. The traits of Imperial Rome are read in the marble busts of emperors, and the bronze medals of the early Renaissance have handed down the features of Italian tyrants and humanists. But in England the eighteenth century sought a lighter expression than bronze or marble. The world, climbing down from its high stilts, no longer dabbled in heroics. Genius descended to earth, and art became softened with manners. The growth of social life awakened social interests, and humanity frankly acknowledged that it was chiefly curious about itself. It wished to gaze at its own resemblance, and, beside the more formal portraiture in oils, found in the mezzotint a means to contemplate its image.

A rich and perhaps unique collection of mezzotints has recently been left to the British Museum by the late Lord Cheylesmore. A selection from these, supplemented by others already in its possession, and arranged with great taste and skill by Mr. Colvin, the Keeper of the Prints, forms the present exhibition of English portraiture from the Restoration to the end of the Regency. It is this historic feature covering every side of life which will most appeal to the visitor. Some will find their chief interest in the dainty prints of great ladies, from Sarah Marlborough to Georgiana of Devonshire. And those who regard the age as one only of elegant trifling, should gaze at the portraits of great sailors, from Rooke and Rodney to Hood; and of soldiers, from "Butcher" Cumberland to "Butcher" Tarleton. The century, with all its many-sidedness, was in portraiture reduced to a single style. Grubb Street and Ranelagh bear equally the hall-mark of the age. One common pose and peruke united a multitude of callings. But inscriptions are fortunately there to remind one that, in spite of the resemblance caused by powdered wigs, mankind was not alike, and that differences really existed between statesmen like Walpole and chancellors like Somers, between thieving proconsuls like Warren Hastings and gallant highwaymen like Jack Sheppard, as they hang in the long gallery of portraits from the last Charles to the last of the Georges.

Although the eighteenth century does not call for strong emotions, it can never leave one indifferent. Unlike the sixteenth, it is no "velvet robe stained with blood," but a rustling silk and a lace frill. To hate requires as strong passion as to love, and there is too much of the Dresden shepherdess about its art for any deep feeling. According to our temperament, we are susceptible to its charm or despise its finicking; and our sentiment towards it determines our appreciation of the mezzotint as the most characteristic of its minor arts in England. For mezzotint etching is essentially English. In England it became acclimated and attained full growth. Hence the double interest of portraiture and nationality in an art as aggressively British as is everything of foreign origin transplanted to English soil. It little matters if its inventor was a Hessian captain Von Siegen, or that, like King William, it came over from Holland. Even its Continental history is linked in a way with the English nation. But Prince Rupert's association with it is too well known. The dashing cavalry leader became an etcher in mezzotint. Cromwell reaped at least this artistic benefit for his country that, though he scattered Charles's pictures at auction, he caused his nephew to abandon the sword for the rocker, and the cavalier exile created abroad what later became an English art. While Von Siegen's prints had resembled the stippling of his French contemporary, Morin, this royal nephew brought to his craft the gifted temperament of the Stuart race. In the very birth of the art, breaking away from the conventional portraiture, his "Standard Bearer," after a false Giorgione, and his "Executioner with the Head of John the Baptist" (a superb impression of this is at the Museum), attained a dramatic quality the mezzotint never afterward reached, and which his Flemish contemporaries, like Blooteling and Vaillant, could not approach.

In the Low Countries, the early practice of mezzotint etching coincided with the decay of art. Vandyck, whose painting would have lent itself so admirably to its use, died too soon. It was never successful in rendering the truthful realism of Dutch pictures. Those etchers who, like Valck, left Holland for England, were as poor stuff as Lely himself and the society they portrayed. The English court was then in a Gallic garb, and the clothes fitted badly. Windsor followed Versailles; Althea copied Astrée, and a French mistress ruled an English king. Two prints of Louise de Kéroualle, whom Charles made Duchess of

Portsmouth, are at the Exhibition, where those of the King and his less merry Queen by Sherwin, first of English etchers, have discreetly been placed back to back. There, also, are portraits of other charmers of that age—*La belle* Stuart, and Anne Killigrew and the Matchless Orinda. But whether we see them in mezzotint or in Lely and Kneller's oils, they are alike insipid and expressionless.

One remembers the reign of Anne rather in letters than by the arts. The etchers of her day are poor company, too slavishly bound by their craft's limitations, knowing not whom to follow. Unlike line-engraving or copperplate etching, the mezzotint is unable to stand alone. It has flourished only as a handmaid to painting, and needed the brush of a great artist to awaken it. If the first half of the eighteenth century is thus its dull period, the second is the golden age. In Fisher and Watson, in Val. Green and John Raphael Smith, the mezzotint attained perfection as an artistic medium in interpreting the masterpieces of Reynolds and Gainsborough. From their painting it drew the theme of its inspiration, and what it missed in depth and intensity it gained in warmth and charm. Few pictures can exceed in attraction the full-length prints of Lady Sarah Bunbury and Elizabeth Linley, of Mrs. Bouverie and the Duchess of Rutland. If the men of that age were arrogantly insular, the women were delightfully so. Seeing their portraits, it is easy to understand the caprices of the modern collector in lately rocketing the prices of the auction-room. There is no need for the initiated to despise this art of the eighteenth century as merely fit for the comprehension of bankers. It requires no such apology. And if in one sense it is best suited for the dining-room and the boudoir, if its qualities are only on the surface, its faults are no more deep-rooted. It is frankly sincere in its limitations, and pretends to be what it is—a charming *pastiche* of painting.

Like Latin poetry, the mezzotint passed through a silver age. In the early years of the last century, when the spirit of Waterloo and the mood of Byron were in Englishmen, a second generation of etchers—the two Wards, and George Dawe, S. W. Reynolds and Charles Turner, to mention the foremost—preserved in mezzotint the features of those who on either side of the Tweed had been painted by Lawrence and Raeburn; and the black shadows of the latter in skilful hands lent themselves splendidly to the treatment of the print. But the death-knell of the art had rung, and about 1820 the new process of steel engraving dealt it the fatal blow. But in treasuring the mezzotint in collections its charm will always evoke the savor of the eighteenth century. Modern utilitarianism will find in it, perhaps, another merit: if the paintings of the great age in English art were all destroyed, one could reconstruct them from the mezzotint, and with it the historic portraiture of the Georgian era.

LEWIS EINSTEIN.

Correspondence.

THOMAS'S "LYCIDAS."

TO THE EDITOR OF THE NATION:

SIR: I would be the last to question Mr. Andrews's (or any other man's) right to his own opinion of Mr. Harvard Thomas's (or any other artist's) work. But when Mr. Andrews undertakes to explain the manner in which I form my opinions, then I must protest. I am not in the habit of inflicting on the readers of the *Nation* my first impressions of whatever it may be, after a cursory glance. Mr. Andrews seems to object to my haste. I wonder he does not complain of my slowness. For, just as it was news to you to learn that John Harvard had left descendants, so it was news to me to learn that the selecting committee at the Academy, after refusing work submitted to them, begged that it might be presented again. Evidently this startling departure on the part of the Academy has become town talk in Capri before the rumor of it has had time to reach London. But I can assure Mr. Andrews that, whatever may be thought in Capri, in London I hold it a great distinction to differ from the unanimous opinions on art expressed in all the big and little journals, from the *Times* down—or up. If he knew those journals and their critics a trifle better, it might have occurred to him that, if the critics were so ready to agree, it was possibly not altogether because of their admiration for Mr. Thomas's "Lycidas," but because of the opportunity its rejection gave for a long-hoped-for attack on the Academy.

Mr. Thomas is to be condoled with for the sensation forced upon him. As I have said, there is nothing in the Academy to be compared with his fine statue. But even were it perfection, its merit would never have dragged it into sudden notoriety: it was because of its treatment by Academicians that it found itself suddenly famous in London. Mr. Andrews's appreciation for the work of his friend is charming; but he should remember—what I thought no one nowadays needed to be reminded of—that it matters not a jot how long an artist has labored over his work or how sublime his theories may be, it is by his achievement alone that he is to be judged.—Yours truly, "N. N."

LONDON, July 16, 1905.

LIBRARIES IN THE AZORES AND AT GIBRALTAR.

TO THE EDITOR OF THE NATION:

SIR: It may be interesting to passengers by the southern route to Europe to know that there are at Punta Delgado in the Azores and at Gibraltar libraries well worth a visit. The one at Punta Delgado is in a monastery which, in common with all the others in the group, has been converted to the uses of either the central or municipal government. It is within easy reach of the port. The principal school, the Museum, and the Library occupy rooms surrounding the cloister. In the church is a model of a ship in gala rig, the only votive offering left. The Library contains some 20,000 books, mostly the result of collecting all the books from the suppressed monasteries. It abounds in early Madeira and Lisbon imprints. In addition to the theology are many books of science in French and Portuguese, many of these Transactions of scientific institutions. Naturally, there are many books on Columbus, including the works of Harrisse, D'Avezac, and the publications issued during the Columbus celebration a few years since. The oldest book was of 1515. A large private library, mostly of scientific books, has been deposited in the Library for use during the absence of the owner in Europe. The Library is supported by the city. The amount raised for books is $300; about as much is paid to the librarian. While the Library is intended for circulation, the character of the books is noteworthy. The circulation reaches 500 a year.

In Gibraltar, not unnaturally, the Library is under military control. It is known as the Gibraltar Garrison Library. The building is plain, but admirably adapted for the purpose. On the ground floor is the main library, on high shelves, mostly behind glass doors, beyond which is a ladies' room, opening on to a garden where at 4 P. M. is served afternoon tea. On the upper floor is a reading-room for men, on the table of which are many valuable atlases. Next to it is a fine room for smokers. All through the building the walls are covered with books; the collection must reach 60,000, including many of extreme interest on Gibraltar. The collection of the Gibraltar *Chronicle* is probably unique, being absolutely complete. I only had time to note that the first account of the battle of New Orleans which reached the Rock on March 18, 1815, spoke of British victory. The true version, with the letters of Keane and others, taken from the London *Gazette*, was published on April 18. The collection of the *Times* goes back only to 1870. A pamphlet on the Siege of Gibraltar published in London in 1782, which I had picked up in New York on the morning of sailing, seemed to be unknown.—Yours truly,

WILLIAM BEER,
Librarian Howard Memorial Library,
New Orleans.

NAPLES, July 18, 1905.

J.-J. ROUSSEAU AND THE "YELLOW PERIL."

TO THE EDITOR OF THE NATION:

SIR: Nobody seems as yet to have remarked that the first to prophesy the "yellow peril," and even the present war, was Jean-Jacques Rousseau in his little-read 'Contrat Social' (chap. viii.): "L'Empire de Russie voudra subjuguer l'Europe, et sera subjugué lui-même. Les Tartares, ses sujets ou ses voisins, deviendront ses maîtres et les nôtres; cette révolution me paraît infaillible." Voltaire laughed at that passage, and upbraided Rousseau for writing like the author of a popular almanac. Has any other writer of the eighteenth century understood the peril arising for Russia from her Eastern, not from her Western, neighbors?

Truly yours, SALOMON REINACH.

Notes.

The first volume of a German translation of Mr. Henry C. Lea's 'History of the Inquisition of the Middle Ages' has appeared at Bonn with the imprint of Carl Georgi, as a portly octavo of pages xxxviii., 648. The translators are Heinz Wieck and Max Rachel, under the supervision of Dr. Joseph Hansen, Archivist of Cologne, well known for his researches in this field, who has

added such annotations as seemed desirable. For the remaining volumes he will have the coöperation of Prof. Herman Haupt of Giessen; so that the work appears under the best auspices.

Autumn announcements of the Baker & Taylor Co. are 'The Appreciation of Pictures,' by Russell Sturgis; 'Impressions of Japanese Architecture and the Allied Arts,' by Ralph Adams Cram; and 'Romances of Old France,' by Richard Le Gallienne.

The new edition of 'Lippincott's Pronouncing Gazetteer of the World,' now proceeding in charge of Messrs. Angelo and Louis Heilprin, will show an increase of some 27,000 names, two-thirds of which will appertain to the "domain" of the United States. It may be expected in October.

The new edition of Kenyon Cox's 'Old Masters and New,' announced by Fox, Duffield & Co., is to be illustrated.

An exhaustive Concordance to Tennyson, modelled on that of Mr. John Bartlett to Shakspere, has been undertaken by Dr. H. L. Hargrove of Baylor University, Waco, Texas, and is well along towards completion.

'Womanhood in Art,' essays by Phœbe Estelle Spalding of Claremont College, Los Angeles, is in the press of Paul Elder & Co., San Francisco. It will be illustrated.

The Oxford Clarendon Press is to bring out in four volumes a translation of the Works of Lucian of Samosata by H. W. and F. G. Fowler.

The illustrated catalogue of the loan collection of historical portraits which was on view at Oxford last spring, will be issued immediately from the above University Press (New York: H. Frowde). The portraits are those of English historical personages who died between 1625 and 1714, and nearly seventy of them are illustrated in the catalogue, to which Mr. Lionel Cust contributes an introduction.

A unique and interesting periodical, which, however, has ceased publication, is the *South Polar Times*. It was issued monthly by the officers of the National Antarctic Expedition on board the *Discovery* during the long and dreary winters of 1902 and 1903, among other diversions to lighten the monotony of the perpetual night. Its contents range over a wide field, grave and gay, scientific and humorous, prose and poetry, including a diary of events and the proceedings of the Debating Society. A striking feature is the numerous illustrations, both in color and in black and white. Some are by Dr. Wilson of the animal life, particularly the penguins, while others are pictures of life on board ship, and silhouettes and caricatures of members of the expedition. There are 500 quarto typewritten pages, and, provided subscriptions enough to cover the expense are received, a limited number of reproductions in absolute facsimile will be issued.

The seventh and eighth volumes of the Public Papers of George Clinton, First Governor of New York, have issued from the office of the State Printer at Albany. The period covered by the earlier is from June 1, 1781, to January 1, 1782, when the Revolutionary series comes to an end; its index will, we are told by the State Historian, be published separately. Volume viii. deals with peaceful matters. The editing is, as usual, eccentric. There is an assortment of portraits, views of buildings, maps, and other facsimiles, interesting in themselves at least.

Considerable inedited material concerning Aaron Burr's conspiracy is contained in appendices ii.-iv. to the third Annual Report of the Director of the Department for Archives and History of the State of Mississippi, just published.

A 'Documentary History of Dunmore's War, 1774,' has been compiled by Dr. Thwaites and Louise P. Kellogg from the Draper MSS., in the library of the Wisconsin Historical Society. It is a private enterprise, is inexpensively manufactured, and limited to 1,000 copies. The editors have served the need of students by inserting in their footnotes copious references to documents whose bulk forbade their use in this collection. A portrait of Lord Dunmore is prefixed.

One of the latest issues in Messrs. D. C. Heath & Co.'s handy "Belles-Lettres Series" is 'Selected Poems by Algernon Charles Swinburne,' edited, with introduction and notes, by William Morton Payne. In form and method Mr. Payne's introduction must be pronounced a model. We find him somewhat too lenient when he remarks that "a certain diffuseness is the condition of success in the long and swinging metres, which best exemplify his [Swinburne's] powers"; from this very diffuseness, in fact, arises too often an obscurity which is Mr. Swinburne's greatest fault as a poet. With what the editor has to say about Mr. Swinburne's theological and political views we are in full accord; the indiscretions of the poet's youth have too long been laid up against him. The selection of poems could hardly be improved upon. The editor's grouping of the poems according to form certainly justifies itself in the case of Mr. Swinburne, of whom it is true that "between the poems of his youth and those of his maturer years there are no marked differences of artistic finish." The notes are exemplary for their concise and lucid statement.

'Ireland's Story,' by Mr. C. Johnston and Miss C. Spencer (Houghton, Mifflin & Co.), is intended for "schools, reading circles, and general readers." It begins with the picturesque traditions of the Baltic invaders about 2000 B. C., and closes with an account of Wyndham's Land Purchase Act of 1903. The interest of the book is mainly political, but a few pages at the end sum up Ireland's achievements in literature. The Irish literary revival is, of course, not forgotten, and there are some good characteristic passages quoted from Yeats, Russell, and the rest. The authors of the book are extremely sanguine as to the future of Ireland and the Irish race. For the latter, indeed, no anxiety need be felt; the Irish have shown a vitality and a power of recovery that have never been surpassed. But unless the leak at Queenstown is stopped, unless by some miracle Ireland becomes commercial instead of agricultural, the future triumphs of the Irish will not be in the land of the race. The writers of the present work have managed to condense a vast amount of information into their sketch of some 400 pages. The illustrations are numerous and fairly good, and the work is written without any unnecessary rancor towards the English, such as often disfigures books inspired, like this, by a spirit of patriotism.

Mr. H. C. Davis of Balliol College, Oxford, has done a very useful piece of work in getting up a reprint of Jowett's translation of Aristotle's 'Politics' (New York: Henry Frowde). He has furnished Jowett's excellent translation with a much-needed index, an analysis and introduction, the last containing a brief account of Aristotle for the general reader. The reprint, which is in a small and convenient volume, will be found especially useful by students of political science who are not students of Greek. Not that even students of Greek in this country can be supposed to read their 'Politics,' when they read it at all, in the original. Aristotle as a whole in America has become even for Greek scholars merely a work of reference. We have often heard this fact regretted and invidious comparisons made with Oxford, where the traditions of the schoolmen still linger and Aristotle is read as diligently as Plato himself. Every honor man at Oxford (and Cambridge, too, for the matter of that) reads the 'Ethics' and a part of the 'Metaphysics,' while the 'Poetics' must, of course, be known by heart. That is all very well, and nothing else would be creditable where men devote three or four years of university study exclusively to the Greek and Latin classics. But in this country to read more than the 'Poetics' would hardly profit a student, who in any case must leave much of the best literature of Greece untouched for sheer lack of time. Every thorough student should have the 'Poetics' by his side when he is reading the Greek tragedians, partly because it is interesting to see what plays an intelligent Greek preferred and why; partly because no one can understand the history of the drama in Europe unless he knows Aristotle's prescription for making a tragedy. For the rest, Aristotle is one of the few authors that gain by translation. He is "the master of those who know," but the artist doesn't merely "know," he invents, or speaks to you of things that are not matters of knowledge. There must be an ingredient of Aristotle in every scholar who is *teres atque rotundus*, but it is not for Aristotle's sake that we must all read Greek if we want to appreciate other literatures; and it is for that appreciation and for that alone that the study of the Greek and Latin classics will still be pursued.

Of considerable value to the anthropologist is the 'Album of Philippine Types,' mostly of Christians and Moros, published under the auspices of the Philippine Exposition Board (Manila, 1904). The work was directed by Daniel Folkmar of Paris. Besides the photographs, physical measurements of several sorts are given, including the cephalic and the nasal index. Forty-three provincial types are represented. Inasmuch as the subjects were taken from among the inmates of the great Bilibid prison, we might suspect their typical quality; but comparative measurements are given to show them to be approximately typical of their several provinces. From the standpoint of the technical anthropologist it is a pity that the photographs should be of the head merely. On the whole, even to the accustomed eye of the student of backward races, these specimens look like a bad lot. Undoubtedly they, as criminals, misrepresent the type in this respect.

Daily Consular *and* Trade Reports has been since Monday, July 17, the title of the publication issued by the Bureau of

Manufactures, Department of Commerce and Labor. It is more attractive, in some respects, than the old issue, is printed on both sides of the page, and so will contain more material, and there is apparently to be distinctively editorial work upon it. We welcome these improvements as signs of the growing appreciation of this Government publication. It is interesting to the general reader as giving in compact form glimpses of the industrial and commercial progress of the whole world. But to the manufacturer of goods for foreign markets and the merchant who places them, it is of inestimable value. Especially noteworthy are the numerous extracts from reports showing how other nations, particularly the Germans, succeed in building up a foreign commerce, and the clear, practical information as to how American goods can win like success.

The evolution of Russian Government is the subject of the opening article in the *National Geographic Magazine* for July. The author, Prof. E. A. Grosvenor of Amherst College, attributes the fact that the Middle Ages ceased in Russia with the accession of Peter the Great, two centuries and a half later than in Western Europe, mainly to the influence of the vast plain which constitutes the European empire. Mountains, at once a bulwark and defence and an inspiration, were denied this land. He briefly sketches the political history to the present time, showing how all advances began at the top and worked downward. The people have again and again opposed attempts to establish a constitutional government, preferring the paternal rule of "The Little Father." Consequently still everywhere, in the village mir as well as in the Imperial Senate, his power is felt, justifying the Slavic proverb, "In Russia two are everywhere, God and the Tsar." Mr. E. Hioki of the Japanese Legation maintains that the purpose of the Anglo-Japanese alliance is the maintenance of peace, and closes with the assertion that Japan has no desire for the Philippines, and does not threaten the United States commercially. He looks forward confidently to the continuance of peaceful and harmonious trade relations between the two countries. There are numerous illustrations of Russian scenes, including a most interesting and attractive picture of the Tsar and his family.

Sir Clements R. Markham's services in the cause of geography for more than half a century are commemorated in the *Geographical Journal* for July, beginning with his farewell address as president to the Royal Geographical Society, in which he chronicles the progress of discovery in the twelve years of his presidency, emphasizing especially the promotion of geographical education, which has resulted in the establishment of schools of geography in the leading universities. The closing pages contain the speeches at the banquet in his honor, that of the new president, Sir G. T. Goldie, being practically a biographical sketch. From this it appears that Sir Clements began his life-work as a member of the Arctic expedition of 1850-51. Among the fruits of his explorations in South America, chiefly in the forests east of the Andes, occupying from two to three years, was the introduction of the quinine-bearing cinchona tree into India, where it has produced incalculably beneficial results to large sections of the Indian people. Mr. Markham accompanied the Abyssinian expedition of 1867-68 as geographer, and was present at the storming of Magdala. His later years have been largely devoted to the practical encouragement of exploring expeditions. It should be added that he has been president of the Hakluyt Society for some fifteen years and has edited several of its publications.

The tide of interest in the group of doctrines called pragmatism, anthropomorphism, humanism, radical empiricism, will-to-believe-ism, instrumentalism, and by several other names, does not seem to abate. There is a "pragmatist club" in Florence, and several members of the review *Leonardo* have been considerably taken up with a controversy on the subject between Signor Mario Calderoni and a writer signing himself Giuliano il Sofista. Professor Vailati has touched upon the dispute in the *Rivista di Psicologia*. The last number of the Geneva *Archives de Psychologie* contains an article written by Professor James in French, and even more charmingly than he writes in English, because more clearly, in which he maintains that the distinction between thing and thought is exclusively functional, and by no means ontological. There are pragmatists who, holding that an ontological distinction is a distinction only so far as it is functional, will see in Professor James's doctrine only a fine elaboration and extension of the theory of immediate perception. It is, at any rate, a fine stone to be added to the edifice the humanists are building up. It is, so far, a house at war against itself concerning not inconsiderable questions; but perhaps this will not endanger its stability, and it certainly renders the discussions more interesting.

Scholarships for American women in English universities on the lines of the Rhodes scholarships for men are to be founded by the Society of American Women in London. At a recent meeting (July 3) of the Society, the scheme was broached, and the hope expressed that the coöperation of the General Federation of Women's Clubs in America, comprising about 700,000 members, would be secured. The scholarships will be tenable for one year, and will be open to two students from each State.

Bavaria, which about a year ago opened its three universities to women on exactly the same terms as to men, has gone one step farther, and now permits women to matriculate also in the technological institutes. During the present summer semester ten women are regularly inscribed in the Institute at Munich.

The Imperial College of Applied Science, which it is proposed to establish in London, is the latest proof that at last Englishmen have grasped the truth that money intelligently applied to the scientific guidance of industry is one of the best investments in the world. They have seen industries which have originated in England drift away to Germany, and have reached the conviction that, if they are to hold their own in the modern industrial world, British students must have facilities for technical instruction equal to those which exist in France, Germany, and the United States. A committee was appointed more than a year ago, of which Mr. R. B. Haldane is chairman, to see how this could be brought about. A preliminary report has just been published which formulates a plan for the union of the many agencies for scientific training in London under one supreme council in which the Board of Education shall be represented. It also recommends the establishment of a department affording a full course of instruction in the mining and metallurgy of metals produced in India and the colonies. A site at South Kensington will probably be provided for the buildings by the Royal Commissioners of the Exhibition of 1851, and a gift of half a million dollars is promised by a London business firm as soon as the scheme takes practical shape. The Government, too, will grant an annual subsidy of £20,000.

German literary journals note with pleasure that the Finnish people, notwithstanding political oppression at the hands of Russia, continue their learned interests unabated. The excellent Finnish Literary Society is publishing a series of translations of classics in philosophy. Plato's 'Gorgias' and the writings of Descartes have recently been followed by a two-volume translation of Rousseau's 'Émile.' At the same time the Society published a second instalment of popular Finnish melodies and songs.

The most noteworthy recent death in the literary circles of Germany is that of Father Heinrich Denifle, who died in Munich while on his way to Cambridge to receive from the English university the theological doctorate. Denifle's researches, particularly in the pre-Reformatory religious life of Europe, were so conspicuous for scholarship and independent thought, that he was one of the few Catholic savants whose investigations were recognized by Protestant scholars also. All the greater was the surprise, to friend and foe, when, three years ago, Denifle, who had in the meanwhile become "sub-archivarius" in the Vatican Library, came out with the first volume of a Luther biography, depicting the Reformer as a voluptuous and evil-minded man. Luther's own words, especially in his 'Table-Talk,' were largely used for this portrait. This led at once to bitter controversies with Denifle's former Protestant friends; the leading discussion, that with Harnack of Berlin, ending in Denifle declaring his opponent a "liar."

—A year ago the management of *Harper's Magazine* made an arrangement for a careful study of conditions in Africa, especially as concerns the slave trade, which the Berlin Conference was supposed to have ended, but which did not yield as readily as the more sanguine had expected. Mr. Henry W. Nevinson, who is at the head of the present expedition, makes his first report in the August number, dealing chiefly with matters about the trading points down the West Coast, where the ravages of one of the deadliest climates on earth are aided by the barter of intoxicating drink "which profound knowledge of chemistry and superior technical education have enabled the Germans to produce in a more poisonous form than any other nation." Concerning the coast as a possible place for enterprising settlers, Mr. Nevinson is utterly pessimistic. "Until the white man develops a new kind of blood and a new kind of inside, the coast will kill him." As to the natives, he sees no hope in the older ideas of the rights

of man and equality in the sight of God. It is only in a small and diminishing circle in England and America that these phrases retain their influence, and with the men who control the destiny of Africa they mean nothing at all. Mr. Nevinson is now in the interior. Prof. Simon Newcomb discusses anew the question whether life exists in the universe outside the limits of our own sphere. In his view the logical probability is that there are many other spheres existing under practically the same conditions as the earth, and therefore probably inhabited by similar forms of life. Professor Lounsbury, having demonstrated in previous articles that usage, and not the grammars and dictionaries, constitutes the only standard of correctness in language, proceeds now to show that in many of the most troublesome cases we are entirely devoid of knowledge as to what the preponderance of good usage really is. The outcome of this discussion seems likely to be an endless harvest of statistical dissertations on minute points of English style from the English departments of our universities.

—Professor Wrong and Mr. H. H. Langton continue to find ample material for their 'Review of Historical Publications Relating to Canada' (Toronto: Morang & Co.). The ninth volume, which covers 1904, takes in about four hundred titles, and furnishes what to all intents is a complete bibliography of its subject for the year past. While no extensive work of great importance on Canadian history, geography, or economics, has appeared during the year in question, the number of creditable monographs is rather larger than usual. Chief among these, in our opinion, stands a life of Talon by Thomas Chapais, which is entitled 'Jean Talon, Intendant de la Nouvelle France (1665-1672).' Other valuable studies are 'Les Normands au Canada,' by the Abbé Gosselin, Gen. Robinson's 'Life of Sir J. B. Robinson,' the lives of Papineau and Cartier by Alfred DeCelles, Dr. Ganong's 'Dochet Island,' and the 'Death of Dulhut,' by the late William McLennan. Among documents, the "Relation par Lettres de l'Amérique Septentrionale," by Father Camille de Rochemonteix, is perhaps the most valuable collection. Among books of travel, Hanbury's 'Sport and Travel in the Northland of Canada' seems to have received more notice than any other work, and is certainly an interesting, straightforward account of unusual experiences. Professor Wrong and Mr. Langton may be said to have proved their talent for organization, since year after year they keep together a representative and widely scattered staff of reviewers. The two most extensive contributors to the present volume are Mr. J. H. Coyne and Prof. A. F. Chamberlain—that is to say if we except the editors, whose own articles continue to be unsigned. We must not neglect to mention among the biographies of men recently deceased a Life of Principal Grant, by W. L. Grant and Frederick Hamilton, and a Life of Principal MacVicar, by J. H. MacVicar. Both these books deserve the attention of those who would be familiar with the progress of education in Canada during the past forty years. A singular slip occurs on the last page of the publication in a notice of Sedgwick's 'Parkman.' After alluding to the refusal of Laval University to give Parkman an LL.D., the reviewer proceeds: "It is strange, indeed, that neither the University of Toronto nor McGill University should have thought of filling the breach." But Parkman received an LL.D. from McGill; and, what is more, Mr. Sedgwick says so.

—Mr. Heinemann has issued an *édition de luxe* of the Catalogue of the Whistler Memorial Exhibition, held in London last winter under the auspices of the International Society of Sculptors, Painters, and Gravers, of which Whistler was the first President; his official and friendly relations with the Society continuing until his death. The text of the ordinary edition sold during the exhibition has been carefully revised. To make any kind of catalogue of Whistler's work, as any one who has attempted it knows, is extremely difficult. For his prints, various authorities already exist; but etchings and lithographs hitherto uncatalogued are constantly appearing, nor is it always easy to trace the various states. To the Catalogue of the London Exhibition alone, fifteen etchings and twenty-three lithographs, never described before, were added. But the great difficulty begins with the paintings, water-colors, and pastels. Old catalogues of the exhibitions in which they were first shown may be found and consulted, but the titles Whistler usually gave them make their identification an almost impossible task. Harmonies in Gray and Silver or Blue and Gold, as it may be, occur again and again, and it is only when he also gave a very necessary sub-title that one can decide exactly which was the special "Harmony" sent to a certain exhibition in a certain year; though, even then, there is the further difficulty that, having given a picture title and sub-title, he was not incapable of changing both. However, the compiler of the International Catalogue has done his best; further information was collected while the pictures were on the walls of the New Gallery; and, in the *édition de luxe*, dates are added in the great majority of cases; a fact that immensely increases the value of the catalogue as a record.

—This edition is illustrated, and the illustrations are numerous and, as a rule, admirable. Some of Whistler's paintings, the "Nocturne Blue and Silver—St. Mark's," for instance, could not be reproduced satisfactorily by any method or process, and the block, giving none of the color or mystery of the original, is bound to tend to smudginess. Two or three of the pastels might have been omitted. But these are the few exceptions. The greater number of plates and blocks are astonishingly good. The "Old Battersea Bridge," the picture just bought in England for the nation, to take one example, is reproduced simply by process, but the quality and tone of the painting are wonderfully well kept; while the plate after the portrait of M. Duret has only to be compared with the two reproductions—one in color—in M. Duret's book on Whistler, for its excellence to be realized. Altogether the Catalogue is of very great value and interest to every student of Whistler and his work. Moreover, it is sure to have the further virtue of rarity, the greatest of all virtues to the collector. It has been issued in a very limited number, only to subscribers. Already the ordinary catalogue, which went into five editions and was exhausted before the close of the exhibition, has been sold for five and ten shillings, so that it seems likely the *édition de luxe* will at once be in demand among the people who buy books not only for their own pleasure, but as a good investment.

—We have received Part I. of the 'Dictionnaire International des Écrivains du Monde Latin,' edited by Prof. Angelo De Gubernatis. It is a quarto of nearly 300 double-column pages, containing more than 2,000 biographical sketches from Aars to Carretti. The editor's purpose is to make a sort of 'Who's Who' of all persons now living who have written about the Latin world. The largest number of sketches belongs naturally to Italians, but there is a fair proportion of French and Spanish names, and a sprinkling of at least a dozen other nationalities, including the Rumanian, Swiss, Russian, Belgian, Scandinavian, German, Portuguese, British, and American. Especial attention has been paid to scholars, so that we find here the authors of important works on Latin philology, archæology, and history, not less than poets and novelists. The sketches are compiled after Vapereau's model, a little more diffuse than those in the American 'Who's Who.' M. Brunetière, for instance, is honored by a two-column notice, in which, as in many of the others, there is a personal note; but, in general, ten or fifteen lines suffice. An examination of many of the entries shows that the work has been well done. Except for evident typographical slips, we have observed few misstatements, the most amusing being that which describes Augustine Birrell as "femme auteur anglaise demeurant à Chelsea." Equally amusing is this declaration, in the notice of Sir Alfred Austin: "Lorsqu'on a songé en 1896 à donner un successeur à Tennyson, on pouvait choisir entre Austin et Swinburne: le choix tomba sur *le plus mélodieux des deux*"! Are we to infer that this was one of the cases where the celebrity himself supplied the sketch? The great usefulness of the work for reference does not need to be pointed out. It gives information not otherwise obtainable about thousands of European scholars and writers. Incidentally it promotes Prof. De Gubernatis's patriotic desire of uniting, intellectually at least, the members of the Latin race, and of bringing to their knowledge the works of their friends of the northern races. Being written in French, the dictionary is accessible to every one. It will be complete in four parts, the last of which will be ready in the early autumn. Prof. De Gubernatis proposes next year to found an *Annuaire du Monde Latin* to continue and amplify his plan. The dictionary, which scholars and libraries can hardly do without, is published by himself at Via S. Martino in Macao, No. 11, Rome.

—The monthly lists of current publications relating to bibliography and library economy, etc., which Dr. Adalbert Hortzschansky contributed during 1904 to the *Zentralblatt für Bibliothekswesen*, have now been collected into an annual volume under the title *Bibliographie des Bibliotheks- und Buchwesens*. As the compiler states in the preface, completeness has not been aimed at; only such titles have been selected under the heads of Book Industry and the Book Trade as have been considered of in-

terest to librarians, and not even the literature of libraries contains all that is known to have been published; larger space has been given to German than to foreign institutions, to scientific than to popular libraries. This limitation of the scope of the work is unfortunate, though it was presumably to some extent unavoidable in a first volume. We hope that future volumes will at least remove the ban on the popular libraries, thus giving a reasonably complete survey of German librarianship in all its branches. The omission of the *Blätter für Volksbibliotheken* is presumably explained by this limitation, but if so, why include the *Borromäus-Blätter?* The period covered by this volume does not coincide with the calendar year, but consists of the latter part (from October) of 1903 and the major part of 1904. It is, therefore, futile to mention omissions. Nothing but unintentional oversight, however, can explain the omission of the *Revista Bibliografica Catalana*, or of the 'Accessions-Katalog' of the Swedish libraries. The arrangement of the material is also open to some criticism. It would seem, for instance, that few persons would care to get a survey of everything that has been published during the year concerning a single library, compared with those who would like to know what library catalogues have been issued, what library reports, or what historical or descriptive works about single libraries. Under the heading "Cataloguing," we find a few miscellaneous titles of articles on cataloguing, indexing, and classification; but Dr. Erman's article outlining his plan for a coöperative cataloguing of German libraries is found under "Works relating to Several Libraries: Germany and Austria," while Mr. Jast's article entitled "A Simple and Economic Plan for Founding a Catalogue Bureau for Public Libraries" has been classed among material relating to Popular Libraries and Reading Rooms. A singular error, which seems to indicate that the compiler has not always examined even publications that have been within easy reach, is found on page 88, where Mr. H. R. Plomer's article, "Secret Printing during the Civil War," printed in the *Library*, is classed under "Bibliography of History: United States and Canada." A reliable, comprehensive, international bibliography of current literature about the Book remains a desideratum.

—Within recent weeks items of much interest have been announced through bulletins and circulars issued by the various astronomical observatories. The sixth satellite of Jupiter was discovered by Mr. Perrine at the Lick Observatory in January, and the tenth satellite of Saturn by William H. Pickering at Harvard College Observatory in April, both by means of photographic plates. The latter moon has a period of twenty-one days, and its distance from Saturn is a little less than that of Hyperion, also discovered at Harvard in 1848. Late in May the first winter snow appeared on Mars, as reported from the Lowell Observatory at Flagstaff, Arizona. It covered an immense area, and surrounded the old polar cap in its Arctic regions. In the same month the Martian canals were photographed at Flagstaff, some of them appearing on more than twenty negatives. From Harvard comes a May circular on the variations of brightness in the four most brilliant satellites of Jupiter. Because of optical illusion, or subjective effect, making them appear faint when very near the planet, a series of measures was made to determine any actual change, with the polarizing photometer attached to the 15-inch telescope at Cambridge. In the order of their brightness they always stood III, I, II, IV, but no evidence of variation can be traced during the time these measures were being made. Of perhaps greater general interest is the bulletin announcing the discovery in the Small Magellanic Cloud of more than 900 variable stars, on sixteen plates mades at Arequipa. The number of stars photographed (with adjacent clusters) is about 280,000—showing thus a large proportion of variables. One of the latest Harvard bulletins gives notice of a probable new star, R S Ophiuchi. Usually the life of such a new object is marked by its sudden appearance in a spot where was no star before, and a gradual fading away until it retreats into a gaseous nebula. But this star has been carefully observed for some years, and both its spectrum and light curves indicate that it should be regarded as a veritable Nova, rather than one of the mysterious brotherhood of variables which, flaming dramatically into photographic negatives, soon fade beyond the reach of even the most sensitive plates.

—Contributions (numbers 1 and 2) have come from the Carnegie Institution at Washington, relating to solar observations at Mount Wilson, in California. Comparisons with observations made upon the sun at Pike's Peak, Mount Ætna, and Mount Hamilton show that Mount Wilson is perhaps the best of all, the solar image being more perfectly defined on many more days; and altogether it offers unusual qualifications for a solar observatory. Five illustrations are given of the mountain, its ascent by horses drawing astronomical material, and some of the buildings and instruments, with full descriptions. It has been decided that families of the mountain astronomers shall live in Pasadena, easily reached in two hours and a half, rather than to isolate them in this high altitude colony. Also, that the extensive machine shops of Los Angeles shall be utilized instead of transporting heavy mechanical material to the summit. Usual complications of remote observing stations are thus largely eliminated, and special work can proceed unhampered.

THE VENN FAMILY ANNALS.

Annals of a Clerical Family: Being Some Account of the Family and Descendants of William Venn, Vicar of Otterton, Devon, 1600-1621. Macmillan & Co. 1904.

This simplest, though most laboriously accurate, of domestic chronicles is at once a series of very truthful and interesting biographies, and also a weighty contribution towards the history of a religious movement which has affected the whole life of modern England. "In pious memory of devout and worthy ancestors," writes the author of the Venn family annals, "these pages have been gratefully compiled." This sentence hits off with exquisite precision the leading traits of the whole family. A reviewer who looks at the Annals mainly from their domestic point of view, may wisely take this dedication as his text, and try (though the task is one of some difficulty) to expound its full meaning.

The external fact which immediately arrests attention is that the line of Venns, who have for three centuries been zealous ministers of the Church of England, constitutes in strictness an ancestry of which any descendant may be gratefully proud. For centuries there has never been wanting a descendant of William Venn of Otterton (himself a clergyman) to render good service to the Church of England as a minister of the national church. In the long clerical succession, which extends from the time of Elizabeth till towards the close of the reign of Victoria, are included by the writer of the family annals five men at least of marked individuality, of high character, of great practical capacity, whose lives cover a period of some 200 years. Each of them commanded general respect, each exerted powerful religious influence; but, of the positions of honor and emolument with which the Church of England has rewarded at times the virtues and not rarely the demerits of the clergy, the descendants of William Venn of Otterton have had practically no share. No one of them has, so far as a reader can observe, occupied an ecclesiastical office of higher dignity than a canonry. Not to receive honors is in this case an honor; but the consistent neglect, alike by prime ministers and bishops, of clergymen marked by acknowledged virtues and talent may excite some curious reflections in regard to the benefit derived by a nation from the maintenance of a wealthy and established church. The long and hereditary succession of eminent clergymen is a phenomenon well worth notice. At a time when clerics or clericalized laymen of undoubted zeal for what they deem religion demand reconciliation with (or, in other words, submission to) the Church of Rome, it is worth notice that an unmarried priesthood, whatever its other merits, can never produce that inheritance of virtue handed down from father to son which, in some families at any rate, distinguishes the married clergy of Protestant countries.

What, however, was the essential characteristic, or, in other words, the inherited peculiarity, of the Venns? The answer is not hard to find. The note of the family character was the combination in each one of its members of the two qualities of devoutness and worthiness. This assertion means something much more than the statement that the clergymen whose lives are recorded in the Venn family annals were good men. This fusion of devoutness with worthiness is not a thing of every-day occurrence. Devoutness means a supreme interest in religion, or, if we consider the quality as it existed among the Venns, the habitual and hereditary tendency to regard the performance of duty in the light of conduct pursued under the influence of the love or fear of God. By worthiness, on the other hand, is meant the possession in a very marked degree of those qualities, such as bravery, honesty, ability, and common sense, which rightly command the respect of Englishmen. Now it is absolutely impossible to hold that devoutness or piety and strong practical ability are virtues which constantly, or it may be even usually, coexist. The Duke of Wellington and Sir

Robert Peel in England, Washington and Franklin in the United States, are considered, whether rightly or not, as the representatives of a sense of duty and assuredly also as men of marked ability, but the word devoutness is hardly the expression which any man would apply to these national heroes. On the other hand, the annals of religious history abound in men marked by devoutness, but yet hardly to be called persons of strict common sense or immense practical ability. So obvious, indeed, is the tendency towards the severance of the gifts suited to obtain success in this world from the sentiment or the characteristics which are popularly associated with the idea of piety, that, by a natural though most unjustifiable prejudice, the mass of Englishmen are but too much accustomed to conceive that saintliness excludes the idea of common sense, and forget the most valuable and Biblical identification of wickedness with folly.

Now every page of the Venn family annals proves that each member of what we have termed the clerical succession possessed exactly the qualities of loyalty, energy, honesty, and capacity which lead to deserved worldly success, and that these secular virtues were with each of them lighted up and elevated by intense devoutness. In all of them were to be seen the virtues of good laymen combined with the ardent piety which popular imagination, at least, associates with the idea of a spiritually-minded clergyman. No family was so entirely clerical, no clerical family was ever so free from the vices of priestliness. If in an age when readers hold that nothing in human nature is interesting but that which is sickly, strange, or abnormal, the piety which gives a nobler touch to the virtues of every-day life—and these virtues themselves—seem to be common and uninteresting, the true answer to this depravity of taste is given by a novelist and a poet. "When you have lived to my years," said Scott to his daughter, "you will be disposed to agree with me in thanking God that nothing really worth having or caring about in this world is uncommon."

This enhancement of English worthiness under the inspiration of hereditary devoutness reappears, though under different forms, in all the conspicuous members of the Venn family. Consider the career of Richard Venn of St. Antholin's, London, who first among the family made the Venn character tell upon the general life of England. He led the studious but active life of the London clergy, contrasted by Macaulay with the bulk of their country brethren. He may have seemed much like the high and dry churchmen of his day. His general conduct and his studious disposition commended him to the esteem of distinguished scholars, but he was much more than a commonplace clergyman. A romantic escape from the temptations offered by a beautiful though married woman to a handsome young man, crowned as it is by the description of his kneeling down at midnight in a solitary church to pour out thanks to Heaven for his escape from moral evil, blends a touch of romance with a sense of religious enthusiasm. His bravery is witnessed to by exploits which might do credit to any man's courage. The mixed sternness and affection displayed in the education of his children explains in part how the absolute and instant obedience to conscience was implanted by him in the hearts of his children, and handed on as a precious heirloom from one generation to another. The intrepid spirit of a man who could say with truth that he had never felt fear, was transformed by religious enthusiasm into heroic resistance to everything which he deemed to be wrong.

The Government of the day wished to promote to the bishopric of Gloucester one Dr. Rundle, who had once used in Venn's presence language which no man, whatever his opinions, could fail to feel unbecoming in the mouth of a clergyman, and which Venn and the religious men of the day felt to be blasphemous. It was a time of clerical apathy. Bishops who condemned the appointment of Rundle knew not how to prevent it. Richard Venn was bolder than the whole Episcopal bench. He announced that he would publicly at Bow Church protest against the appointment of Rundle, and ground his opposition upon the indecency of Rundle's language. He was known to be a man of his word. Offers of preferment could not seduce him, the threat of poverty could not drive him away from the path dictated by his conscience. Dr. Rundle never filled the See of Gloucester; the incumbent of St. Antholin's sacrificed every chance of preferment.

In the life of his son, Henry Venn of Huddersfield, you find the characteristics of the father repeated in a man, however, of essentially different character. You have still the combination of lay virtues with religious enthusiasm. In one sense this Henry Venn was the most eminent of his family. He threw himself heart and soul into Evangelicalism (which, be it remembered, was then the new spirit that gave fresh vigor and life to the religion, to the morality, and even to the politics of England). That Henry Venn was one of the most effective of preachers no human being can doubt; that his 'Complete Duty of Man' met the wants of the time (1763) is certain. Its success was rapid and wide; shortly after its author's death twenty editions had already been sold. This sort of manifesto of the Evangelical views may now strike us as one of those sermons which a reader "is accustomed to glance at and dismiss." But indeed no age can ever do full justice to the ethical or religious addresses which affect another. The simple truth is, that the best sermons owe their effectiveness to their harmony with the needs and feelings of the audience. All moralists teach pretty much one lesson. The great preacher is the man that teaches it in terms which go home to the men of his age. Still less can we hope that essays or sermons can reproduce the personal charm of their author. That Venn of Huddersfield possessed an element of strong personal attractiveness is clear. A colonel who had heard of him as a Methodist met him and treated him for a short time with haughtiness and reserve, but at last was fairly overcome by his conversation and manner. "Talk of Methodists," said the officer to his sister, "why this Mr. Venn is one of the most agreeable men I was ever in company with." Yet this teacher, with many of the graces of a man of the world, displayed on his deathbed an almost passionate religious fervor. He felt a triumphant joy in death. "Your father," said the doctor to Venn's daughter, "would have died a fortnight ago if it had not been for joy at dying."

Of the subjects of these family chronicles the last is John Venn of Hereford (1802-1890). In him the hereditary union of piety and practical ability took its very most lovable, and, in the eyes of a student of character, its most original form. He began his career as a layman. As one of the most brilliant of the civil servants trained at Haileybury, and as a young man who displayed during his short career in India the abilities and the high moral character which were an earnest of success in the civil service of the East India Company, he seemed destined to occupy a high place among the administrators who in the first quarter of the nineteenth century governed and extended England's Indian empire. Ill health compelled him to return to England after little more than a year's residence in India. He again displayed his aptitude in learning at Cambridge, and gained university honors which proved an innate capacity for success. Under the influence, however, of Simeon, he took orders, accepted a small living, and, as the vicar of St. Peter's, Hereford, passed all the working years of a long life in the zealous discharge of parochial duties. To many men this sacrifice of worldly ambition might have been a lifelong disappointment. We doubt whether he or his relations ever felt the exchange of a probably brilliant for an almost unknown and very lowly remunerated career to be a sacrifice. He had, after all, returned to what one may call the sphere of work natural to and hereditary in his family. Nor, one may suppose, was the transition from the position of a layman to that of a clergyman more than a change of occupations. We may feel sure that in any case John Venn, whether at Hereford or in India, would have discharged the duties of life with rare ability and under the influence of religious devotion.

Still, the family character took in his case a very special turn. He exhibited, as his biographer notes, a very special kind of intellectual gift. He was

"a remarkable instance of a rare type of mind. He was one of those who, without the slightest pretence of scientific knowledge, seemed to possess an almost intuitive capacity of assimilating by conversation and observation every scientific suggestion which is able to help forward the practical schemes which they have at heart. He was the polar opposite of those who read everything that comes out and apply nothing."

Hence his ardent desire to save the souls of his parishioners was combined with an equally ardent wish, and, what is rarer, with an infinite capacity for devising plans, for their temporal benefit. With little knowledge of political economy, his common sense and insight led him to anticipate many of the methods now suggested by charity organizers for the management of allotments and loan societies for the benefit of the poor. Though without any socialistic leanings, he achieved one reform at least in which a Socialist might justly triumph. He created at Hereford a mill where all the flour should be honestly ground, and all the profits whereof above (if we remember rightly) 5 per cent. paid on the capital of the concern should be devoted to objects of local utility. He thus freed the poor from the oppression of fraudulent millers, and ultimately throughout a large district reformed the character of the millers themselves.

A distinct Calvinist, he gave a practical

confutation of the idea that Calvinistic doctrine produces sternness or gloom. If he held man to be utterly depraved, he trusted individual men with only too much confidence; he in effect entertained the most cheery optimism in daily life. When past eighty-two, he said that he hardly knew whether it rather made him laugh or feel indignant when he heard people say that the world was getting worse and not better. During a discussion on the work of Dr. Farrar on the non-eternity of punishment, he said, in tones of the deepest feeling, "My dear, I wish with all my heart that I could believe every word he says. I can't now; perhaps I shall some day." These things may be called by some noble inconsistencies. They are really the profound trust in the old-enough doctrine, "Now abideth faith, hope, love; and the greatest of these is love."

RECENT FICTION.

A Dark Lantern. By Elizabeth Robins. The Macmillan Co.

Sawdust: A Polish Romance. By Dorothea Gerard (Madame Longard de Longarde). Philadelphia: The John C. Winston Co.

A Maid of Japan. By Mrs. Hugh Fraser. Henry Holt & Co.

Miss Bellard's Inspiration. By W. D. Howells. Harper & Brothers.

On Tybee Knoll. By James B. Connolly. A. S. Barnes & Co.

Miss Robins's novel, entitled 'A Dark Lantern,' is full of agitating suggestion for inflammable circles where the woman question is always a burning one. Two problems of conduct are presented, discussed at great length, and solved according to the author's conception of right reason and the will of God. The first is, whether the heroine, Miss Dereham, shall or shall not consent to a morganatic marriage with a German prince, who cannot confer the title of Royal Highness on an English girl without rank, and, indeed, is not very eager to do so. His makeshift offer is spurned by Miss Dereham, and, when he tries to compromise her in a high-born kinsman's ancestral castle, his wicked device is frustrated by the energetic suspicion of the young lady's godmother, Lady Peterborough. Miss Dereham comes out of this affair with honor, and her behavior may be commended for imitation to any perplexed damsel in a similar situation. Her usefulness as a model can be limited only by the number of princes possessing the ancient privilege of left-handed marriage and anxious to urge it.

The second problem is not exactly universal in its bearing, but it touches common life more nearly. Some years (we are not told how many), after declining a sort of a marriage with a prince who courted her, Miss Dereham determines to live, without any sort of a marriage, with a physician who does not appear to want her at all! The problem presented is, whether a woman, feeling certain that she is experiencing a grand passion, is justified thereby in forcing herself upon a reluctant man, and in throwing dignity and decency overboard. Miss Robins finds such behavior not only justifiable, but admirable, and almost holy. She appears to believe that men have always had an unrestricted privilege of pursuit; but her impression is, we think, mistaken. Women in these matters are very well protected by the law, and, had the case been reversed, Miss Dereham could have summoned the police and obtained reasonable assurance of future immunity from annoyance. Contemplation of the male prerogative has gone to Miss Robins's head and disturbed her faculty for logical argument. She feels so bitterly against persons described as "mighty men of old" who collared the right to propose, that she despises the woman's right to decline, coeval and correlative. She even makes light of the agonies suffered from time immemorial by rejected lovers. She actually assumes that men can take a peremptory "No" without injury to their self-esteem; yet her own hero, Dr. Vincent, couldn't. His contempt of Miss Dereham's ardent, though tardy, wooing was largely inspired by a long and bitter memory of the snub she had administered when he was a young man of no importance. Miss Robins's general contention, that the life of woman must be a finer affair than it is, were she allowed freedom to pounce on a mate, is enfeebled by her particular illustration. Her heroine's union with Dr. Vincent, both before and after it was legalized, is conspicuously unhappy, and she has never the advantage of being able to remind him how he had begged and implored her, with tears in his eyes, to take him. Perhaps the woman's time-tried ways of proposing indirectly have their anxieties, but, so far as we can see from Miss Robins's demonstration, the direct proposal is fraught with horror, and no woman should go in for it lightly.

Herr Mayer, the chief character of 'Sawdust,' is a familiar figure in American life and fiction, but one does not expect to meet him, symbolizing progress in the Polish village of Zanck, which lies in the foothills of the Carpathians. Herr Mayer began life as an officeboy, speedily became a partner in an established business, then seized the business, and pursued the game of grab in many directions. At the moment of his introduction, he is a middle-aged millionaire, concentrating his energies on the conversion of a Galician forest into marketable lumber. Herr Mayer, savagely denuding the Carpathians, is essentially the same man as John Smith slaying and burning in the Adirondacks; but, owing to the different social conditions and customs of their respective scenes of operation, the story of the European self-made man is richer and deeper in human interest than anything possible in America. Herr Mayer has ignorant, picturesquely attired peasants to grind below the living wage, and clever, poverty-stricken Jews to oppress just for the sake of showing his power. He has the joy of ruining a noble, Count Rutkowsky, hereditary Lord of Zanck and surrounding forests, and the agony of seeing his only son fall in love with the Count's daughter. He can lavishly entertain princes, whom he, of course, theoretically disclaims, and he can even give his mill hands a holiday to look at an Emperor who represents everything that he hates and despises.

The author does not love Herr Mayer, but she treats him fairly, giving him the benefit of his only virtues—energy, industry, and a scrupulous honesty in matters of small importance. The story is told naturally and carefully, and the forest is saved from utter destruction by a royal highness with a passion for stag-hunting. This method of bringing about a happy conclusion is simpler and apparently surer than is belated American legislation for forest protection.

Mrs. Fraser has never expressed her sympathetic understanding of the Japanese better than in the story of Himé, the shell-gatherer of Enoshima. Himé's mother before her had been a shell girl, who, when her English husband abandoned her, gave her baby to Sakura, old and lonely and poor, then swam out in the shining sea and returned no more. Himé grew up with Sakura, to be beautiful and good and happy, unmistakably destined for all the sorrow and all the joy that may come to a woman on a lonely, lovely island, as in other more prosaic places. Her romance is a repetition of her mother's, excepting that her lover, though of her father's race and blood, is not perfidious or faithless, but a true Briton, who has to fight for victory and would never think of relinquishing the spoils. The coincidence of close relationship between Himé's father and lover is decidedly improbable, and one can easily imagine other and more harmonious devices by which Mrs. Fraser might have reached her desired conclusion. Otherwise the tale is uncommonly well imagined, with a central conception of beauty supported by all the detail of characterization, incident and description. The sketch of Nakayama, whom Barrington engaged as travelling companion and teacher of Japanese, is very clever, showing keen appreciation of the extent and limitation of American education on a Japanese youth of Samurai rank. We would accept Mrs. Fraser's observation as perfect if Nakayama did not insist on speaking what she calls "American journalese" in a fashion more English than American.

'Miss Bellard's Inspiration' is a light comedy with enough social satire to remind us that Mr. Howells is not just fooling for our summer holiday. The heroine is a young professor in the "oratory department" of a Western college, who drops on her relations, the Crombies, trying to endure (they conscientiously say "enjoy") a quiet summer in the mountains. She is attended by a young Englishman, and when her aunt asks sternly, "Why, Lillias Bellard, are you engaged to Mr. Craybourne?" she answers, "Well, no. But we're *seeing*."

The Crombies' seclusion is still further invaded by Mr. and Mrs. Mevison, who are "seeing" about divorce. The unhappy relations of the pair suggest to Lillias many fantastic arguments against matrimony, and these prolong the *seeing* period. Mr. Howells renders the Mevison situation lightly, but that does not conceal the ugly facts which jar the idyllic atmosphere of the piece. Crombie is as good a name as another for that American man and his wife whom Mr. Howells delights to represent and whom his readers delight to meet. The man has got past surprise at the woman's baffling inconsistencies, and the woman no longer feels any sting in her husband's affectionate derision. They have really no longer views of each other. They have survived the necessity for understanding by the strength of what their reticence would forbid them to call a great love. It may be a horror of sentimentality that makes Mr. Howells so shy of sentiment. Yet the power of expressing sentiment is

a valuable grace of life, and, without it, fiction, even brilliant fiction, has a certain aridity.

The title of Mr. Connolly's novel 'On Tybee Knoll' implies nothing as to the contents, or at most indicates some Arcadian setting. But, as it happens, his characters spend most of their time on the water or in it, for frequent immersion seems to be part of their daily routine. The scene is laid off the coast of Georgia, at the mouth of the Savannah River, and all the interest centres in lumber and dredging operations. The hero, as is usual in a novel of commercial adventure, is young and intrepid, the heroine is not this time a grain-elevator or an apartment house or a mine, but a raft of dredging-poles, for which more lives are risked than for any flesh-and-blood heroine since Helen of Troy. Perhaps that is one of the explanations of the rise of this type of fiction, that nowadays the adventures of lovers must needs be tame or tediously psychological, since all the energy, all the fire, has been diverted to commercial enterprise. This is a tale full of heroic effort. Within some twelve hours the hero, always in quest of the stolen raft, is cast up on the shore from a swamped boat and sunk in a disabled tug; saves a sloop that he finds adrift in a storm, and a steam-yacht that has lost her engineer; rescues from the water some half-dozen drowning men separately, and, not least, recovers the raft. All this is told in an artless, slangy style, absolutely devoid of literary finish, crowded with the technical jargon of the lumber trade—another instance of the new type of fiction written, one supposes, to electrify the tedious leisure of the American business man.

DICEY'S LAW AND PUBLIC OPINION.

Lectures on the Relation between Law and Public Opinion in England during the Nineteenth Century. By A. V. Dicey. The Macmillan Co. 1905.

In 1898 Mr. Dicey delivered before the students of the Harvard Law School a short course of lectures on the history of English law during the last century; of the present volume these lectures form the nucleus. The form of lectures has been preserved, and the book is an attempt to sketch "the connection or relation between a century of English legislation and successive currents of opinion." Its aim is to draw from well-known facts of social, political and legal history certain conclusions which, "though many of them obvious enough, are often overlooked, and are not without importance."

Perhaps one of the most striking of these conclusions is one which seems to Mr. Dicey to lie on the surface—that there has been in England for three generations an immediate relation between the development of public opinion and legislation (to say nothing of the course of judicial decision) without parallel in other modern communities. "Nowhere have changes in popular convictions or wishes found anything like such rapid and immediate expression in alterations of the law as they have in Great Britain during the nineteenth century, and more especially during the last half thereof." Compare, for instance, France, the land of revolution. In 1804 the Code Napoléon was published, and its fundamental provisions have stood to a great extent unaltered from that day to this; in 1804 George III. was on the English throne, and English opinion was dead against all changes, yet between 1804 and the present day there is hardly a part of the English statute-book which has not been materially changed.

It may be said in reply to this that the parallel is not quite synchronous, for the Code Napoléon was already a hundred years ago an enlightened and modern body of law, representative in 1804 of an enlightened and modern opinion, behind which the Georgian public opinion and statute-book lagged very far. The convulsion of the French Revolution effected a modernization of French law and institutions which made that of England in 1804 antique in comparison. In the same way the spirit of legislation in this country at the beginning of the nineteenth century was vastly more modern than that of England. It was not until about the time that the passage of the Reform Bill of 1832 brought new classes into control of the government that English law began its monumental march. Once begun, the rate of progress was all the more accelerated by the circumstance that the advance found an extraordinarily effective organ in a popular representative body wielding a power unknown elsewhere. From 1832 on (waiving the question whether this constitutional phase has shown signs of coming to an end or not) a measure which could command a majority of the House of Commons sufficient to indicate that the country was behind it, was sure to become a law. This state of things existed neither in France nor in the United States; consequently, in the last fifty years we have become accustomed to look to England for a rapidity and comprehensiveness in legislation representative of public opinion, unseen elsewhere. These considerations possibly throw light on a political phenomenon superficially puzzling.

Another conclusion connected with this is that stated in Mr. Dicey's third lecture, to the effect that the progress of democracy (he fully admits that the spirit of modern English law-making is democratic) does not afford "the clue to the development of English law since 1800." The notion that it does afford the clue is connected, in the author's mind, with a fallacy which he thinks infects all speculations about the effects of the advance of democracy—"the assumption that there exists such a thing as specially democratic legislation which every democracy is certain to favor." There never was an assumption, he says, "more clearly at variance with the teaching of history." Unless we are mistaken, Mr. Dicey here comes very near falling into the error which always dogs the heels even of masters of political analysis, namely, that of fancying that there must be somewhere some one clue to the institutional development of a particular community, some one cause which will adequately explain all the phenomena. Of course, he is perfectly aware that there is no such clue in the field of legislation, there is no such single cause anywhere. Consequently, it is indubitable that there is no specially democratic code which *every democracy is certain to favor*. If there were, we could predict a code or a chapter of the Revised Statutes as we can an eclipse. But it by no means follows that there do not exist *tendencies* in the legislation of a democratic period which are pretty certain to exhibit themselves in every country, and which Mr. Dicey's book shows are exhibiting themselves effectively in England. His eighth lecture is devoted to the "period of Collectivism"—that in which we now live; but what is Collectivism except the use of the machinery of the State for what are conceived as essentially democratic objects? And what phenomenon is so universal in modern legislation wherever in the world democracy has made any headway, as this use of the power of the State? The following is Mr. Morley's picture of "Collectivism" as applied in England as long ago as 1881—and, as Mr. Dicey points out, enormous strides have been made since:

"We have to-day a complete, minute, and voluminous code for the protection of labor; buildings must be kept pure of effluvia; dangerous machinery must be fenced; children and young persons must not clean it while in motion; their hours are not only limited but fixed; continuous employment must not exceed a given number of hours, varying with the trade, but prescribed by the law in given cases; a statutable number of holidays is imposed; the children must go to school, and the employer must every week have a certificate to that effect; if an accident happens, notice must be sent to the proper authorities; special provisions are made for bake houses, for lace making, for collieries, and for a whole schedule of other special callings; for the due enforcement and vigilant supervision of this immense host of minute prescriptions there is an immense host of inspectors, certifying surgeons, and other authorities, whose business it is 'to speed and post o'er land and ocean' in restless guardianship of every kind of labor. . . . But all this is one of the largest branches of what the most important Socialists have been accustomed to demand; and if we add to this vast fabric of labor legislation our system of Poor Law, we find the rather amazing result that in the country where Socialism has been less talked about than in any other country in Europe, its principles have been most extensively applied."

Add to this the tremendous advances in the field of legislation which Socialism, or Collectivism, has made in Germany, in France, in Italy, and the United States, and the inference seems fair enough which many conservatives commonly draw, that in a modern industrial community a democratic suffrage is a direct cause of the use of the power of the State for collective ends. In other words, there is a direct connection between Collectivism and democracy. Just as the machinery of the State will be used by a church for its own aggrandizement, or by a landed aristocracy in the landed interest, or by a slaveholding aristocracy in the slaveholding interest, so will a vast proletariat electorate show in the long run an ever-increasing tendency to use the power of numbers in what seems to be the interest of themselves. Of course, the phenomenon will take different forms in different countries: in France it will result in the forced creation of a great body of peasant freeholders, in Germany it will produce state insurance; in the United States it will convert a political party with very different original political aims to "Populism"; in England it will, among other things, produce "municipal trading"—in fact, every imaginable experiment will be tried, all democratic, all collectivist.

In England, to our minds, the process has been greatly accelerated by the fact to which we have already referred, that the Government has been in these respects for

a long time "uni-cameral"—the decision of a single House, directed by a practically democratic electorate, has been final. This fact, the control of legislation in its own interest by the new electorate, explains, too, a phenomenon, otherwise surprising, to which Mr. Dicey and many others have called attention—that in other directions the whole structure of English society remains so *un*-democratic. The English Church remains the State Church; the House of Lords remains what it has always been; the Crown enjoys the respect and affection of the people. The reason, in our analysis, is that they have not interfered, they have not resisted the tide. Finding that it could have what it wanted through a legislative organ specially adapted to making democratic demands effective, the new electorate has made England the home of "Collectivism" under the veil of institutions historically opposed to any such change.

But Mr. Dicey's book, properly speaking, does not deal with political causes. It is rather an interesting picture of the vast legislative changes effected by public opinion during the great Victorian period by means of the machinery of the Constitution worked by an ever-widening electorate. Such periods in the history of the world, or of any country, are, as Mr. Dicey points out, very rare. In his hands, the whole century divides itself into three parts: first, the era of old Toryism or legislative quiescence, distinguished, among other things, by the publication of Blackstone's Commentaries, in which we may see, through their own eyes, British law and institutions as they appeared to pretty much all conservative men a hundred years ago (1800-1830); second (1825-1870), the period of Benthamism and Individualism, during which it is hardly too much to say that the opinions of Bentham and the theories of Individualism and *laissez-faire* governed England; third, the period of Collectivism (1865-1900), during which Benthamism, Individualism, and *laissez-faire* have fallen into disrepute, and humanitarian and socialist legislation have made such an enormous advance. Mr. Dicey's review of the interaction upon one another of legislation and opinion is valuable and original, and makes the volume a striking contribution to legal and institutional history. The author's powers of statement and elucidation are so well known that it is unnecessary to dwell upon them. His chapter on judicial legislation—a most difficult subject—is a model. But the book must be taken for what it is—an analysis of an important phase of a memorable chapter in the development of a society. Political theory as a basis for forecast is carefully eschewed. The author evidently thinks that Collectivism has not spent its force, but his method of inquiry almost precludes him from throwing any light on the future. Bacon says somewhere that those who desire to predict what is going to happen, must ascertain what is in the minds of the generation which is coming on. But as the electorate grows larger, the task of making this sort of a guess becomes more and more difficult. Demagogues guess Imperialism and Protection; young enthusiasts guess new experiments in what may be called Humanitarian Collectivism; Jingoes dream of gigantic wars and new Colonial empires; Socialists struggle for the absorption by the State of public utilities; meanwhile Benthamism, the sanctity of contract, Utilitarianism, and with us the old Democratic theory of government, seem as dead as old-fashioned Toryism. In this maze is there no clue of any kind? Certainly not in Mr. Dicey's pages; this kind of guessing is not in his line at all. He shows us Toryism devoured by Benthamism, and Benthamism in its turn devoured by Collectivism; beyond, all is dark.

The Flying Lesson: Ten Sonnets, Two Canzoni, a Ballata, a Double Sestina, from Petrarch. By Agnes Tobin, With frontispiece designed by Walter H. Pritchard. London: William Heinemann; San Francisco: Paul Elder & Co. 1905.

The Sonnets of Michael Angelo Buonarroti. Now for the first time translated into rhymed English. By John Addington Symonds. Second edition. London: Smith, Elder & Co.; New York: Charles Scribner's Sons. 1904.

It is a pity not to speak well of verse so daintily put forth as Miss Tobin's, and by an American of our Pacific Coast, and in a field of literature whose cultivation is much to be commended, and following a previous essay ('Love's Crucifix'—nine sonnets and a canzone from Petrarch) highly praised abroad. The failure of criticism, however, leading to a false encouragement—to publish, not to invent—imposes a duty to hold up the standard. We begin by pointing to the sign of inaptitude that glares in the fanciful titles given to sonnets undenominated in the original. What less Petrarchan, at the very forefront, than "The Flying Lesson"? The conventional *argomento* for this sonnet reads: "Reflecting that Laura is in heaven, the poet repents his excessive grief and calms himself." "Tired Eyes" is another whimsical appellation, in lieu of the sober: "Despairing of seeing Laura again on earth, he nevertheless consoles himself by imagining that she aids him from heaven." Worst of all, certainly—indeed, unpardonable—is "The New Dress," on which we must dwell a little, after giving the version in full:

The glorious angels, and those blessed ones
  The citizens of Heaven, the first day
  My Lady enters there do block her way;
Marvelling greatly each to see her runs:
"What light is this? And what new beauty suns
  Its strangeness here?" they to each other say.
  ["]Because a thing so gemmed, in such array,
Has never come before.["] From sext till nones—
Preening herself, content with her new home,
  She shines the whitest-burning seraph down;
But now and then the undazzled eyes will roam,
  The bird-bright head will turn, the jewelled gown
Rustle and shimmer like to moonlit foam;
  She waits for me; and oh! I come—My Crown!

The octave is fairly faithful, but the intrusive word "gemmed" paves the way for a most extraordinary perversion and modernity in the sestet. There exists a translation which we may set over against Miss Tobin's in lieu of a prose exposure, because it contains not a thought or a figure wanting in the Italian, and equally omits none to be found there:

What day my Love passed on, around her pressed,
  With wonder filled and gentle sympathy,
  The elect of angels and the souls that be
The populace of heaven and therefore blest.
"What Light is this?" thus they themselves addressed,
  "And what new beauty? Form so gloriously
  Attired ne'er in this base century
From vagrom earth gained this high place of rest."
But she, with her changed hostelry content,
  And peer of the most perfect, as it were
Expectant turns anon, with glances sent
  Backwards to see if I do follow her.
Hence all my thought and will on heaven is bent,
  Hearing her pray I be no loiterer.

The reader may now see what has been interpolated and what omitted. Does he ask what is the pretext for "the jewelled gown Rustle and shimmer like to moonlit foam"? Nothing but "abito sì adorno," which has no reference whatever to Parisian modes, but, obviously, has a spiritual significance, though not to the exclusion of Laura's earthly beauty, even as Dante sings of the dead Beatrice—

> . . . "'l piacere de la sua beltate,
> partendo se da la nostra veduta,
> divenne spirital bellezza grande
> che per lo cielo spande
> luce d'amor, che gli angeli saluta";

and as Milton dreams of his "late espoused saint," who

"Came vested all in white, pure as her mind.
  Her face was veiled; yet to my fancied sight
Love, sweetness, goodness in her person shined
  So clear as in no face with more delight."

We think it needless to examine these translations further. They are all vitiated in the same fashion. Some good lines occur, and we would not deny Miss Tobin the poetic gift; but she should not wrestle with Petrarch except in secret, for by printing she propagates false patterns of an art calling for the utmost fidelity, combined with idiomatic freedom.

The second edition of John Addington Symonds's 'Sonnets of Michael Angelo Buonarroti,' the first translation into rhymed English, dated at Davos Platz, December, 1877 (London: Smith, Elder & Co.; New York: Charles Scribner's Sons), raises another question which we might have discussed in connection with Miss Tobin's versions. It is this: What is the advantage of metrical translations over prose if the result is a prevailing obscurity and an almost total lack of charm and power to interest as English verse? The repute alike of the artist-poet and of the translator should have contributed to an earlier demand for a second edition if the joint product had been what it should have been to be worth undertaking. Mr. Symonds had a difficult task, but it cannot be said that he achieved it in a masterly manner, nor without a license which often makes his English harder to read than the rugged original. The exigencies of the rhyme were too much for him. Evidences of this abound in the sonnet to Dante, which we append as a not unfavorable specimen:

No tongue can tell of him what should be told,
  For on blind eyes his splendor shines too strong;
  'Twere easier to blame those who wrought him wrong
Than sound his least praise with a mouth of gold.
He to explore the place of pain was bold,
  Then soared to God, to teach our souls by song;
  The gates heaven oped to bear his feet along,
  Against his just desire his country rolled.
Thankless I call her, and to her own pain
  The nurse of fell mischance; for sign take this,
  That ever to the best she deals more scorn:
Among a thousand proofs let one remain;
  Though ne'er was fortune more unjust than his,
  His equal or his better ne'er was born.

This in the main correctly gives the development of Michael Angelo's thought, yet with some forced, evasive and even amazing renderings like line 4, for

"O' al suo men pregio ogni maggior salire,"

comparable with Carducci's lines to G. Parini—

"Altera aquila al polo
Troppo ogni emulo ardire hai tu precorso."

Add the missing of the stress of the antithesis in line 6, for

"E le porte che 'l ciel *non gli contese*,
La patria chiuse al suo giusto desire";

and sundry other blemishes, which one may discover for himself since everywhere the Italian text (with not a few typographical errors, as in the sonnet just considered) confronts the English. There is a good mezzotint portrait frontispiece.

Shelburne Essays. By Paul Elmer More. Second Series. G. P. Putnam's Sons. 1905.

Essays in serious criticism are rare nowadays. Nervous impressions of great authors are plentiful, and so too are those adventures with masterpieces which are written with a light heart in the superficial adventurous style. But there is nothing of the buccaneer or the æsthete about Mr. More. His is the criticism that takes infinite pains, dissects out every nerve; and, if his essays lack something of the agreeable irresponsibility which gives a certain verve to the touch-and-go critic, they leave the reader with a fresher and firmer grasp of the subject. That, we suppose, is the duty of critics of authors who have become classics. The reader's footing becomes worn and slippery with use, or so well trodden that he wearies of it, and when he turns to a new essay on some favorite author it is because he hopes to find cut for him a fresh foothold or at least a new flower or two planted in the well-known path. What an advantage for him should those flowers have roots!

Mr. More's first essay is on the "Elizabethan Sonnets," and was inspired by Mr. Sidney Lee's reprint in the 'English Garner' last year. Mr. Lee was very hard on the Elizabethan sonneteers, the writers of the "sugred sonette," all their sugar stolen from "the sweete laureate of Italie" or the poets of the Pleiad who thought they were writing like Anacreon. Mr. More is no more indulgent. All that he says in this essay is interesting and suggestive. But we are inclined to think that, like Mr. Sidney Lee, he is too exacting with the sonneteers when he implies that what they wrote was likely to be essentially inferior for the very reason that so many of their ideas and figures were borrowed from abroad. Mr. More expresses his relief that "Mr. Lee has found no model in foreign tongues" for Drayton's great sonnet, "Since there's no help, come, let us kiss and part." It would not disturb us in the least or shake our admiration of Drayton if an Italian or French original were discovered to-morrow. As it stands, it is a masterpiece of English, a triumph of the grand manner in sonnet writing. Why, by the way, does Mr. More call it a *jeu d'esprit*? Is that a term of reproach? When Mr. More reads his Yeats, does he think the less of those exquisite stanzas, "When You Are Old," because Mr. Yeats borrowed the central idea from Ronsard? The first few lines at least are almost a translation.

"When you are old and gray and full of sleep
And nodding by the fire, take down this book
And slowly read, and dream of the soft look
Your eyes had once. . . ."

Who does not remember the sonnet of Ronsard that inspired this?:

"Quand vous serez bien vieille, au soir, à la chandelle,
Assise auprès du feu, devisant et filant,
Direz, chantant mes vers, en vous esmerveillant:
'Ronsard me célébrait du temps que j'estois belle.' "

Is Ben Jonson's "Drink to me only with thine eyes" any the worse for being taken straight from Philostratus? The plagiarism in poetry when the poets write in different tongues is not to be counted against the creditor. What so many of the Elizabethan sonneteers lacked was the talent of making their own what they borrowed.

Mr. More's essay on Hawthorne is a study of the New England soul at first in the grip of conscience, then, with Hawthorne, exchanging the conscience for the no less tyrannous sway of the imagination, and at last, with Mrs. Wilkins Freeman's characters, governed entirely by the nerves.

"From the religious intolerance of Cotton Mather to the imaginative isolation of Hawthorne, and from that to the nervous impotence of Mrs. Freeman's men and women, is regular progress. The great preacher sought to suppress all worldly emotions; the artist made of the solitude which follows this suppression one of the tragic symbols of human destiny; the living novelist portrays a people in whom some native spring of action has been dried up, and who suffer in a dumb, unreasoning inability to express any outreaching passion of the heart or to surrender to any common impulse of the body."

Mr. More closes his essay with the query whether, after that period of paralysis and general impotence described by Mrs. Freeman, we are destined to behold in its turn the new ideal of "another half-civilization, blindly materialistic as its predecessor was harshly spiritual." We read somewhere the other day that, by an intervention which the writer hinted might be divine, in punishment for faults too many to enumerate here, the New England woman as we meet her in Mrs. Freeman's stories is rapidly becoming extinct, replaced by full-blooded foreign women with no such exalted and uncomfortable ideals. If this be so, Mr. More's question is partly answered.

Mr. More's book tempts one to discuss details which are out of place in a notice that must be so short as this. We should have liked to say a word in defence of the personality of Lamb, "the frolic and the gentle," and to take time to contradict Carlyle's bilious criticism which Mr. More cites as evidence that Lamb's wit was more or less "ghastly." We do protest, in passing, that a personal estimate of one of his contemporaries, especially a contemporary author, by Carlyle should never be brought into court. No character was safe from that digestion.

The last essays in the volume are two detailed and useful studies entitled "Delphi and Greek Literature" and "Nemesis, or the Divine Envy." In the former we were suddenly brought up by a sentence which seems to us to involve a false antithesis. Mr. More, speaking of Protagoras and Socrates, says, "certainly it is a prophecy full of foreboding for the fate of Greece that the one was loaded with riches and honor, whereas the other died a felon's death in the gaol of Athens" (p. 205). Now, the fates of Protagoras and Socrates were parallel rather than antithetic. Socrates, who despised wealth, received from Alcibiades and his other rich pupils all the honor he wanted, and in the end was put to death for impiety and undue influence. Protagoras, desiring both riches and honor, achieved both from the same class of young Athenians who debated with Socrates. In the end he, too, was branded as an iconoclast. At the age of seventy he wrote, or first ventured to publish, a skeptical work 'On the Gods.' He was prosecuted and his book was burnt. On this he fled from Athens and was drowned on his voyage to Sicily. Euripides in one of his choruses accused the Athenians of the death of the "All-wise one, the nightingale of the Muses," his friend Protagoras.

The Newfoundland Guide-Book, 1905: Including Labrador and St. Pierre. Edited by D. W. Prowse, and published by Bradbury, Agnew & Co., Ltd. London. 1905.

No better proof can be adduced that Newfoundland is emerging from the fogs of ignorance and inaccessibility which have heretofore enveloped it, than this very interesting, well printed, and excellently illustrated guide-book. It is edited by that eccentric historian of the island, Mr. Prowse, who is not inaptly said to have rediscovered it. He introduces the readers to his collaborators in a vivid sketch of its romantic history, endued with that touch of strong prejudice, expressed in emphatic language, which gives a zest to whatever he writes. His fellow-authors are men of such rank that the book possesses more than the ephemeral value of an annual guide. J. G. Millais, H. Hesketh Prichard, F. C. Selous all tell of their experience in hunting caribou and other deer on the barrens of the island—and the sport must be rare which could elicit from the greatest of African hunters the assertion; "I know of but one really wild country where big game is still plentiful, which can be quickly and easily reached, and where a shooting trip can be undertaken at a comparatively small cost, and that is the island of Newfoundland." The chapters on fishing were supplied by Admiral Sir W. R. Kennedy and Sir Bryan Leighton. The Admiral's recollections date back twenty-five years. "At that period," he says, "the salmon-fishing was poor, owing to netting and barring, and but few salmon were caught with rod and line; but the sea-trout fishing was excellent." Since then the netting of salmon at the river mouths has been brought under partial control, and the size of the meshes so regulated that fish of thirty pounds can escape up stream, with consequent improvement of the salmon fishing, so that Sir Bryan Leighton can record a catch of thirty-one fish made in the Codray by himself and wife in the summer of 1904. Those who do not aspire to salmon-fishing can catch in every stream and lake an abundance of trout, but the brook-trout are pale of flesh and of a languid spirit. Fishing, on the other hand, for the exquisitely silvered and lively sea-trout, if they are caught early in the season from a boat, as they dash at your fly in troubled waters off the shore, affords more excitement than monotonously casting for hours to induce a sulky, obstinate salmon to rise.

A description of Labrador is added by that devoted lay missionary, Wilfred Grenfell, M.D., who is giving his life and his eminent medical skill to improving the condition of the North Sea fishermen. Statis-

tics, industrial and mineral, are included in abundance, but the prominence assigned to sport bespeaks the real attraction of the island and its greatest present source of wealth.

Early Eastern Christianity: St. Margaret's Lectures, 1904, on the Syriac-Speaking Church. By F. C. Burkitt, Lecturer in Palæography in the University of Cambridge. E. P. Dutton & Co. 1904. Pp. xii., 228; with five photographs of Edessa.

In the Oriental renaissance through which we are passing, and in which we are learning to know the East again in all its life as Europe has not known it since the Templars struck hands of brotherhood with the Assassins, and Chaucer's Knight fought thrice for his faith in Muslim lists—in this renaissance a half-forgotten and more wholly neglected side of the Christian Church is coming again to light. It is not so very long since the student of that Church in its early period conceived that it was in the Greek and Latin Fathers only that the material of his labors lay. Some few adventurers there had been in the twilight East—in part Syrians and Copts, disciples of the Roman Propaganda, in part eccentrically learned scholars of uneasy curiosity; but all were absolutely without effect on the solid ranks of the classicists. Not even the wealth of Syriac MSS. which reached the British Museum in the middle of last century, and which has occupied two generations of Syriacists since, effectually broke down this learned obscurantism. Perhaps Cureton's too great faith in his Syriac authorities may have raised the distrust of the learned of Europe, and thrown them off what was, after all, a true trail. Similarly, Widmanstadt's wild claims, in the preface to his *editio princeps* of the Peshitta in 1555, that the language of that version was the vernacular of Jesus, prejudiced him and his cause with his contemporaries. But the ring-fence round the Greek and Latin world could not, in the long run, be kept standing. The slow sapping, by steady publication of Oriental texts and translations, prepared for the final storm which the last ten years have seen. Now the time has come when "the Oriental churches" can no longer be spoken of with a vague patronage, but the fundamental fact is finally admitted that the Syrian Church must stand as an equal third beside the Churches of the Greek and Latin worlds. The student of early Church history is no longer fully equipped with his two sacred tongues, but must face Syriac as well, with other unknown and still more barbarous possibilities in the background. Just as the exegesis and criticism, textual and otherwise, of the Gospels has been pushed back to bear upon their Aramaic originals—to be hypothetically reconstructed—so with the later Church. In a word, it has been suddenly rediscovered that Christianity is an Oriental faith, and that part at least of its first centuries of development was spent among Oriental peoples.

But though this fact stands now fast, all that is involved in it has been known only to a small circle of students. There has been a key, after a fashion, to Syriac literature since Wright's pioneering article in the 'Britannica' appeared (later repeated in enlarged book-form), and since Duval's more recent 'Littérature Syriaque.' But these were much more bibliographical than historical; dealt rather with books than ideas. Practically, until this volume of Mr. Burkitt's appeared, there has been no guide to which the plain man might turn in search of the meaning of Syrian Christianity for itself and for the Christian faith in general. And it is a pleasure to be able to say how eminently satisfactory this book is. It is for the plain man, and, in its space, it can take only elements here and there in the Syrian Church, its history, doctrine, usage, and discipline; but all is handled with the mastery to which Mr. Burkitt's work has accustomed us. Behind its avoidance of learned detail and its picturesque yet simple outlines, the scholar is evident who, in Rabbula's revision, solved the problem of the Peshitta and who proved the Syriac origin of the 'Acts of Thomas.'

The first chapter deals with the Edessene legend—King Abgar, Addai and the letter of Jesus—and with the real succession of the bishops of Edessa, so far as it can be recounted. The second takes up ground which Mr. Burkitt has already made abundantly his own, the Syriac versions of the New and Old Testaments. He thus states in a word his conception of the textual character of the Diatessaron, the "Old Syriac" and the Peshitta: "The text of the Gospels underlying the Syriac Diatessaron, where it can be recovered in its original form, represents the Greek text as read in Rome about 170 A. D." The text of the Gospels in the Old Syriac version represents, where it differs from the Diatessaron, the Greek text as read in Antioch about 200 A. D. Finally, the text of the Peshitta Gospels, where it differs from the Old Syriac and from the Diatessaron, represents the Greek text as read in Antioch about 400 A. D." To this the evidence does seem to point. The third chapter, on early Syriac theology, is a very suggestive study of the three Syrian doctors—Aphraates, so far in some ways from ordinary Christian statements of belief as to have been called "the Persian Sage," as though a stray philosopher of theologic tastes in the extra-Greek world; St. Ephraim, in his sentimentality and intellectual weakness the opposite of Aphraates in his independence and grasp; and Rabbula, the ascetic and disciplinarian who grecized the Syrian Church and wrought it to a unity which broke in final schism fifty years after his death. It is part of the life and reality which Mr. Burkitt brings, that we cannot forget throughout this chapter—though there is no direct allusion—that these lectures were delivered in St. Margaret's, Westminster, and at the invitation of Canon Henson.

The fourth chapter tells the singular story of the slow acceptance of marriage, among Syrian Christians, as a thing to be blessed by the Church and compatible with receiving the sacraments—so slow that it was not completed until the fifth century. That change has little reality for us now, but much historical suggestiveness; the parallel with Buddhist conceptions can hardly be over-pressed. But the next chapter, which tells the story of Bardaisan and his disciples, of his dialogue on fate, and of his final expulsion from the Syrian Church, and, with him, of philosophic thought, brings us back to our own times. Mr. Burkitt names only the Abbé Loisy, but it is evident that his thought falls much nearer home as well. Lastly comes a description and estimate of a religious novel, the 'Acts of Judas Thomas,' and of a mystical little epic, the 'Hymn of the Soul.' Both are unique in their way, and by far the most interesting relics of the Syriac, perhaps of the Old Christian, literature. They show, and this Mr. Burkitt works out luminously, what was the true point of difference between Gnosticism, a religious nihilism, and Catholicism, which saw the Church as the "Body of Christ" abiding in the world, and thus found a fixed point round which a new civilization could crystallize when the old had passed away. It is, then, especially in this fertility of ideas and suggestion that the value of Mr. Burkitt's book lies, and for which it can be most heartily commended to all who realize how searching is the discrimination of essential and non-essential through which Christianity is now passing.

Specimens of the Elizabethan Drama from Lyly to Shirley, A. D. 1580—A. D. 1642. With Introduction and Notes. By W. H. Williams. Oxford: Clarendon Press; New York: Henry Frowde. 1905.

After all, why should not an editor have the courage of his convictions and "glean after Lamb"? This is an age of anthologies. There is no field richer than that of the Elizabethan drama. It is the orthodox belief that this drama is more effective in parts than in wholes; Lamb has but slightly harvested it, and there are thousands of busy people whose only knowledge of it must be cursory and superficial, and who may be more easily interested and satisfied with specimen extracts than with whole plays.

All of these considerations are reasonable enough, and doubtless justify the Clarendon Press in sending forth this book for educational purposes. We have no quarrel with it. Within the limitations of its plan it seems to be well done. All the important dramatists of the period are included, and the selections from each are fairly "typical and representative." It is no fault of the compiler's that, after his more than four hundred pages of specimens, probably two or three times that number, equally worth giving, still remain unquoted in our specimen books. We have noted a score or more in Beaumont and Fletcher alone which, in our judgment, are nearly all equally good literature. (We give this instance with conviction and proud humility, although having the fear of Professor Wendell before our eyes.) The scenes are "complete in themselves," although not always literally complete scenes are given, and what Lamb has once given is not here repeated. For this last feature there seems to be no convincing reason. Lamb's plan is very different, and people nowadays read his book rather for Lamb's own inimitable comments than for the broken extracts for which they serve as foil and excuse. Lamb might very well have been disregarded in planning these selections, once the primary audacity of daring to poach upon Lamb's preserves was decided upon.

The editor, sensibly, does not anywhere attempt to emulate Lamb. His comment is conservative rather than penetrating, and everywhere keeps constant reference to the authoritative norm of recent critical opinion. It is safe but, with rare exceptions, unoriginal. His scale-poising is painful and

laborious. And he is more than ordinarily fond of quoting good old Latin scraps after the good old English fashion. But in all substantial matters—connecting introductions, notes, and text—(so far as we have tested it) his work as an editor seems to be well executed. Dr. A. W. Ward is his guide; and Dr. Ward has done great services to the history of the English drama, and is generally a safe and sound critic. Middleton, we feel, the editor (following Swinburne's lead—a stimulating but an unsafe guide) has unduly exalted. Shirley receives fairer treatment than he has been accustomed to of late. Webster is but faintly praised—contrast the admirable critique of Webster's qualities prefixed to Professor Sampson's recent edition of Webster's two great tragedies in the Belles-Lettres series. We, however, are glad to see an attempt to rehabilitate the good literary fame of Chapman, even though it be at the cost of some rather fallacious paradox as to the lucidity and grace of his diction, and the fluency and sonorous quality of his versification.

After all is said, however, is it really true that the best way to get a speaking acquaintance with the Elizabethan drama is through a book of specimen extracts, even though the extracts be all scenes "complete in themselves"? There is no harm in this book or in any anthology competently made. Men may read the salient poetry of detached passages, such as Lamb gave or as Professor Williams now gives, with pleasure and profit. But is it true that that is the only thing or even the chief thing in the Elizabethan drama outside of Shakspere? Do we get the mighty vigor, the pervasive atmosphere, the interplay of character, the force of contrast and climax, and the whole dramatic and theatric effect of even an unequal and unorganized minor Elizabethan play in that way? Decidedly not, we feel. Therefore, there is more sound use in reproductions giving whole plays, like the volumes of the Mermaid Series, the Temple Dramatists and the Belles-Lettres Series, than in books of extracts like these. It is better to know three or four plays as wholes than a hundred "specimens" from a hundred plays, given as parts.

The Myths of Plato. Translated, with introductory and other observations, by J. A. Stewart, M.A., White's Professor of Moral Philosophy in the University of Oxford, etc. Macmillan. 1905. Pp. xii., 532.

The Platonic Conception of Immortality, and its Connexion with the Theory of Ideas. By R. K. Gaye, M.A., Fellow of Trinity College, Cambridge. London: C. J. Clay & Sons; New York: Macmillan. 1904. Pp. ix., 257.

Nothing at first sight seems better to explain itself than the practice of story-telling. The love of well-told tales is deeply rooted in the human breast, and ever lurks in the corners of all but the dullest minds as one of the happiest survivals of the golden age of childhood. What wonder, therefore, that the makers of high thoughts should freely avail themselves of this human passion, and often seek to convey their message in a form so pleasing and effective? And if they are great artists, the stories which they tell will, of course, be good. And the more they treat of topics abstract and abstruse, the more needful will it be to provide us the relief of pleasant tales which disguise the grim earnest of their teaching, insinuate it into our minds, and fix it there more vividly. The fact, therefore, that Plato was a great poet as well as a great philosopher seems ample reason why he loved the story as a literary vehicle, and why the "myth" is so great a feature in his writings. But, of course the practice has its dangers. The artist's purpose may obtrude too nakedly, and disgust us as a frigid and transparent allegory. This danger Plato usually avoids so well that we are tempted rather to complain that even his allegories wax refractory and run away with him, growing up into stories before they have taught their lesson. Again, although it is part of the legitimate use of a myth to convey pictorially and by suggestion a doctrine not yet ripe for rigid and scientific statement, it may easily be abused as the readiest way of extricating an argument from embarrassments in which its own unsoundness has involved it. Nor can Plato always be acquitted of telling a tale where in strict logic he should have completed an argument. In fact, the student of his philosophy soon discerns that at certain points, such as when a transition has to be effected from the immutable purity of the Ideas that truly *are*, to the distorting flux of a plurality that only *seems*, or when the glories and terrors of a future life have to be pictured, a myth may be expected; and if he is wise, he will welcome the diversion, for nowhere does Plato's art rise higher or radiate a more inspiring glow than in these myths. They are the purple patches of his system, but often patches which conceal gaps in its logical texture.

All this, of course, has long been known, but it forms too simple a theory of the matter to satisfy the pedantry of academic circles. And so Professor Stewart, though himself no pedant, but rather a true scholar with a poetic taste and touch, has thought it worth his while to formulate the facts more palatably to the scholastic mind. He has conceived the brilliant idea of translating the myths of the most imaginative into the technicalities of the least imaginative of philosophers, to array Plato in the trappings of Immanuel Kant! And so they are explained as appeals to transcendental feeling, which aim imaginatively at (1) representing the Ideas of Pure Reason, and (2) at deducing the Categories of the Understandings and Moral Virtues (p. 45). By "Transcendental Feeling," be it said, Professor Stewart means an unreasoning conviction that life is good, which is the a-priori condition of our continuing the struggle and sets the aims of our reflective (the so-called "higher") faculties. This feeling is the source of our *faith* in the *value* of science and conduct, and expresses itself in the value-feelings and judgments which control our theoretic judgments. It has its roots deep down in "the vegetative part of the soul," in the dumb, undifferentiated, preconscious functioning, which can still dream itself at one with universal nature and has as yet no consciousness of time, because no apprehension of succession. To this dream-consciousness we still are able to revert, and by the dreams it nourishes it has power to impress and to impose on the wide-awakeness of the logical understanding. Thus dreams, ideals, and poetry are fundamentally akin, and lie deepest in our nature. For it is the essential function of poetry to rouse this Transcendental Feeling by inducing lapses into the state of dream-consciousness, and to this end metrical form is merely auxiliary (p. 388).

It is thus evident that the Oxford professor is disposed to seek the unity and worth of psychic life in the region of the subliminal, and has allied himself with the pragmatist protest against the self-sufficiency of intellect. It is evident, also, that he conceives the surplus of content whereby the soul buoys up its life and transcends mere intellection, as feeling in its dumbest and most irrational form, and that this may be disputed. But it is highly significant of the anti-intellectualist trend of modern thought, and was a bold idea, to put this interpretation upon so revered a champion of rationalism as Plato has hitherto been thought to be.

Doubts, too, beset the application to Platonic thought of the Kantian antithesis of the categories of understanding and the ideas of pure reason. What this ultimately means is that our loftiest ideals, and the practical beliefs which sustain our life, must ever remain matters of faith which can never be converted into science. This, indubitably, was the compromise with science which Kant offered to religion. But whether, as Professor Stewart seems to think, either side could rest content with this, and still more whether it can really be ascribed to Plato, may well be questioned. No proof is given that Plato ever despaired of knowing, and Professor Stewart himself disclaims any explicit consciousness in him of this peculiarly Kantian attitude (p. 45).

We have said enough, perhaps, to make clear the philosophic standpoint of the comments which accompany Professor Stewart's scholarly and excellent translations of the Platonic myths. It remains to add that he illustrates most copiously and appositely from the poets, that his work is full of curious and discursive learning, and concludes with an interesting study of the Cambridge Platonists of the seventeenth century. As to the validity of Professor Stewart's view of Plato the mythologist, criticism will probably have to reserve judgment until he has supplied us also with an estimate of Plato the logician and metaphysician. Until then his account is incomplete, and cannot refute Zeller's older and simpler theory that most of Plato's myths are intimately related to gaps in his knowledge and difficulties in his metaphysical system. These Professor Stewart does not touch on, beyond making the startling suggestion that the whole doctrine of Ideas is mythical (p. 347). But if so, what (if anything) is the metaphysical substance of Platonism?

This same question is raised also by Mr. Gaye's monograph on the Platonic conception of immortality. Mr. Gaye is a Fellow of Trinity College, Cambridge, and his book is the product of a prize essay. Despite a certain gaudiness of external appearance, it is a thoroughly academic study. It is lucidly written and scholarly, but not remarkable for novelty and originality, and is singularly lacking in appreciation of what Professor Stewart rightly emphasizes, viz., the poetic side of Plato. It seems also oddly provincial that, throughout his book, Mr.

Gaye should apparently assume that only Fellows of Trinity College, Cambridge, and practically no one but Dr. Henry Jackson and Dr. Archer Hind, have ever reflected on Platonic philosophy before him. Hence we note much discipularity and hear much about "Plato's later theory of Ideas," but get no explicit exposition of it. We cannot, therefore, conjecture how Mr. Gaye would grapple with the two great puzzles of Platonic exegesis—Plato's self-criticism in the "Parmenides" and Aristotle's account of Platonism. Instead of these vital explanations, we get only references to Dr. Archer Hind's commentary on the "Timæus." But as the "Timæus" is wholly "mythical" in form, and as the whole doctrine of personal immortality is mainly emphasized in the myths, and as, ever since Teichmüller's day, it has seemed very doubtful whether it was really compatible with the logic of the system, it is evident that Mr. Gaye's argument sorely needs a systematic estimate of the functions of the Platonic myths. It looks arbitrary and uncritical to tak them as scientific, or as pictorial, as suits one's convenience.

A Criticism of Systems of Hebrew Metre. By William H. Cobb. Oxford: Clarendon Press; New York: Henry Frowde. 1905. 12mo, pp. vii., 216, with bibliography and indexes.

For many centuries, Hebrew poetry was thought to rest only on parallelism, or the double expression of the same thought, and on the use of rare words and archaic forms. It seldom shows alliteration or rhyme; metre was hardly suspected, though it was known that the psalms were sung by choirs and were accompanied by stringed and wind instruments. Even as late a critic as Kuenen said: "Metrisch ist die hebräische Poesie nicht." But already in the seventeenth century attempts had been made to find rhythm and measure in the Old Testament poetry. Bishops Hare and Lowth discussed the matter (the latter rather sharply) in the eighteenth century; in the nineteenth the discussion became extensive and more general. Mr. Cobb in the little volume above noted gives not only his own views in chapter i. (Inductive), but also those of many earlier authors, beginning with J. J. Billerman (Berlin, 1813), and following him up with Joseph L. Saalschütz (Koenigsberg, 1825), who very properly in his essay coupled Hebrew poetry with Hebrew music. He then takes up the labors of the great Heinrich Ewald (about 1839), of Ernst Meyer (1850), of the modern Bible critics Dr. Ley and Karl Budde, of Dr. Gustav Bickell, of David H. Müller of Vienna, and winds up with some very recent writers, among them Eduard Sievers, a professor of German at Leipzig and an amateur in the Semitic field, who in 1901 published a book of six hundred pages on Hebrew metre, the most voluminous of all books on the subject. In two hundred pages he sets forth his theory, and devotes four hundred pages tc illustrations.

The first step in the inquiry is naturally this: Is there really any metre? Only when the learned world has been fully convinced on this point, can the next question be taken up: Are syllables counted to make the line or *stichos*, or only beats or accents; and if we count syllables, must we, as in Greek and Latin, distinguish between short syllables (of one *mora* each) and long syllables (each of two or more *morœ*); must we count them straight along, as in French and Italian, or must we count only the beats and stresses, which would range Hebrew with the German measure of the 'Nibelungenlied' and with the old Anglo-Saxon and Icelandic poems? The line or *stichos* being established, the inquiry will next turn to the stanza, and lastly to strophe and antistrophe.

The right counting of the syllable is thus the starting-point. The classic literary Hebrew was that of the south, of Jerusalem and Judæa, attested by the transliteration of names in the Septuagint, in the Gospels and in Josephus, and known in our times as the Portuguese pronunciation, as contrasted with the German-Polish style of reading, which has come down from the dialect of Galilee. The former is closely akin to Arabic, the latter to Syriac. The former pronunciation and the analogy of Arabic, contrary to the opinion of Saalschütz and of Bickell, show that the Sheva *mobile* is to be counted. These scholars, if they were acquainted with either Arabic or with French verse, must have known that poetry does not drop but rather retains light syllables, or restores them where they are lost in prose and in common conversation. However, where the Masoretes put a composite Sheva under a guttural, while any other letter would in like position take the mute Sheva, it should not count; hence Ya'qob, not Ya'aqob, in three syllables. The furtive Patah seems in most cases not to count; but "he" and "she," as in Arabic, are *huwa* and *hiya*. The so-called "Syriasmus," *i. e.*, the coalescence of two light vowels across an Alef or Yod into one, takes place sometimes, but not always, for Hebrew prosody is somewhat flexible like that of Homer, who occasionally splits a long vowel into two, and sometimes counts two vowels for one, either long or short, and who gives to his two heroes (Achilleus and Odysseus) sometimes a double and at other times a single *l* or *s*, just as he stands in need of a short or of a long syllable. The dual ending *ayim* should be read in one syllable, as in Arabic *ethnên*.

With this key applied to a rhythmic passage, say the first three verses of the 58th chapter of Isaiah, the couplets will be found to run thus:

8, 8; 8, 8; 8, 9; 9, 9; 9, 9; 10, 9; 11, 10.

Or, taking at random Job's speech in chapters 12-14, there are 63 distichs and 11 tristichs. Among the former, 24 have each two parts of equal length; in 20 others, the parts differ by one syllable; the first *stichos* is shorter than the second in the first verse of the chapter, it is longer in the last verse. In the tristichs, each line has on an average seven syllables, in the distichs, eight. Now all this cannot be accident. The poets must have had the length of the *stichos* in mind, consciously or subconsciously, when they wrote their poems.

The agreement between corresponding lines is perhaps, on the whole, fuller when word accents than when syllables are counted. And here we shall go safest if, with rare exceptions, we follow the traditional Masoretic accents. These were placed in their positions in accord with the Judean or Portuguese pronunciation, as appears not only from the use of the Metheg, but also from the persistent fact that the Jews of the southern ritual habitually read with the accent as it is written, while the German and Polish Jews prefer to put it on the penult. Mr. Cobb leans decidedly to the count of beats or accents rather than of syllables. To follow him or the predecessors whom he reviews into the building of stanzas, or into the frame of the *qinah* or lamentation measure, would lead us too far.

The prosody and metre of the several poetical books and chapters of the Old Testament are not yet sufficiently established in detail to be made the basis for emendations of the text, and our author justly reproves his predecessors wherever they too boldly take this course. Mr. Cobb and those whom he reviews often try to make their ideas on the rhythm of Hebrew texts better understood by the reader through quotations of popular German or English poems; these are sometimes well, sometimes rather ill, chosen.

Minor Poets of the Caroline Period. Edited by George Saintsbury, M.A. Vol. I. Oxford: Clarendon Press; New York: H. Frowde. 1905.

Mr. Saintsbury, for his many services to literature, is always entitled to a good word from the critics, but especially so in a case like this when (beyond the approval of his own conscience) he can look for no other reward than their appreciation. A better edition of Herrick or of Herbert would be greeted by the applause of a large and grateful public; but what recognition can be hoped for labors spent on Benlowes or on Flecknoe—writers whom the public will never read, and could not be forced to read? Yet these minor (or minim) poets, coming as they do at the time when English poetry was undergoing transformation, and meanwhile was in a state of solution in which new crystals were forming, are full of interest for those who study literature not as an anthology, but as a growing organism. We cannot understand the result if we do not understand the intermediate stages.

The longest poem in the volume, the "Pharonnida" of William Chamberlayne, is also the most important as the chief English example of the heroic poem or "romanticised epic." The story (if the reader can manage to hold it in his mind through all the poet's startings-off and gyrations) is not without interest, and it is all a-sparkle with curious and ingenious fancies like a summer night with fireflies, among which there is every now and then a flash of true poetry. The poem seems to have been kept long on hand, and to have received additions from time to time. It was not published until 1659; at the end of Book II., the poet breaks off to await the result of the battle of Newbury (1644), and yet in Book I., canto 3, the scene of Argalia before the High Court of Justice is an unmistakable reminiscence of the trial of Charles I.

Of the other poets in this volume we have not room to speak. The *eau sucrée* of "the matchless Orinda" has probably been tasted by many of our readers. As for Patrick Hannay, the excessive rarity of his works must be the justification of this reprint; while Benlowes's "Theophila," like Silas Wegg's leg-bone, may have value "as a Monstrosity."

"In all the land, range up, range down,
Is there ever a place so pleasant and sweet?"

THE 1000 ISLANDS

There may be somewhere on the earth a more delightful region than that of the Thousand Islands, but if there is, it has not been discovered. It is as fine as the Bay of Naples, with no danger of being buried in hot ashes. There are 2,000 picturesque Islands scattered along the twenty-five miles of one of the most beautiful rivers in the world. You can find out a great deal regarding it in No. 10 of the "Four-Track Series," "The Thousand Islands," of the St. Lawrence River issued by the

DIPLOMATIC MYSTERIES
By VANCE THOMPSON
J. B. LIPPINCOTT CO., Philadelphia

A notable book of national importance, to be published shortly

Government Regulation of Railway Rates

By Hugo Richard Meyer, *University of Chicago*

Professor HUGO RICHARD MEYER is said to have proved to be the one man in this country competent to give the Senate Committee on Inter-State Commerce certain vital information. Railroad men quote him as the best posted man on the subject in the world. Unusual interest and value attach themselves to his new book which is a comparative study of the results of public regulation of railroad rates, pointing out clearly the two opposing policies, with their respective advantages and disadvantages. *Cloth, 12mo. Ready shortly*

Restrictive Railway Legislation By Henry S. Haines

Follows the growth of railroad legislation corresponding with the development of our national railroad system in its several fields of activity; in railroad incorporation, finance, construction, operation, and traffic.
Cloth, 12mo. Ready shortly

VACATION READING

Both of the two most notable novels of the summer should go into your vacation trunk

Mr. Maurice Hewlett's The Fool Errant

BEING THE MEMOIRS OF FRANCIS-ANTONY STRELLEY, ESQ., CITIZEN OF LUCCA,

is a tale of eighteenth century Italy, whimsical in its vivacity, exquisite in its distinguished style. The *Boston Herald* says: "It strolls down the avenue of contemporary fiction with a gipsy vagabondage that is enticing and enchanting."
Uniform with "The Forest Lovers," etc. Cloth, $1.50

Mr. Robert Herrick's Memoirs of an American Citizen

is a crisp, vigorous, straightforward story of the way Van Harrington made his success in life. Intensely absorbing as a story, it is also a document of startling significance, thoroughly "American" in spirit, reflecting the present day and hour as no other does with equal interest. *Illustrated drawings by F. B. Masters. Cloth, $1.50*

And some of these according to your taste and leisure

BARBARA'S

At the Sign of the Fox

is a fresh, sweet and wholesome story by the author of "The Garden of a Commuter's Wife," with the atmosphere of open-air New England—"A good book for the summer season—or any other."—*Boston Advertiser.*
Cloth, $1.50

JOHN HEIGH'S

The House of Cards

is a record by a sometime major of volunteers of an old-time romance. Its scenes are so closely related to Philadelphia life of the past fifty years, as to raise an uncommon interest in the identity of the author, who possesses at once such wit and literary skill, and so much first-hand knowledge. *Cloth, $1.50*

CHARLES EGBERT CRADDOCK'S

The Storm Centre

has the civil war atmosphere for its background, but is a well-told amusing story more of flirtation, courtship and love than of fighting or history. *Cloth, $1.50*

Miss ROBINS'S

A Dark Lantern

is a novel of the English social order. *The Reader* has no hesitation in saying that with one exception "no book so fascinating, so essentially romantic, so charged with those qualities of charm which constituted the strength of Charlotte Brontë's work, has appeared for a long time."
Cloth, $1.50

Mrs. BANKS'S

The Little Hills

is full of quaint half-forgotten, old-time fragrances; as her "Oldfield" suggested sweet lavender, this leaves behind it the spicy odor of pinks. *Cloth, $1.50*

Mr. JACK LONDON'S

The Game

"Nothing Mr. London has written is better than this brief, yet tremendously forceful story."—*Times-Union*, Albany.
Cloth, $1.50

THE MACMILLAN COMPANY, Publishers, 64-66 Fifth Avenue, New York

The Nation.

NEW YORK, THURSDAY, AUGUST 10, 1905.

The Week.

President Roosevelt's ready bonhomie never stood him in better stead than in enabling him to avoid so deftly all the awkwardnesses of etiquette and precedence and malapropos which lay lurking for him at the meeting on the *Mayflower* on Saturday. Easy informality was the salvation of the occasion. The nervous and doubting envoys saw visibly embodied before them that "backwoods Charlemagne of empires new" who, as Lowell pictured him,

"—meeting Cæsar's self, would slap his back, Call him 'Old Horse,' and challenge to a drink."

And if the President's bearing was a masterpiece of tact, the language of his toast to a just and lasting peace was such as befitted the great occasion. When all Europe applauds his humane sentiments, Americans may be forgiven for feeling that their lungs "draw braver air."

Much concern is expressed in Washington over the question what to do for "Loomis, Acting," who is just landed, preceded by his own notification that he should arrive very tired. To the mind of official Washington it is, of course, unthinkable that he should become "Loomis, Passive." Something must be done for him. It is not for the likes of us to rush into the high spheres where his fate is under consideration, but we humbly suggest that the difficulty is one of a multiplication of functions on Loomis's part. He has essayed the double rôle of diplomat-financier, but played it badly. Why not now ask him to consent to a division of labor? Diplomat alone, it is at last perceived even at Washington, and eke at Oyster Bay, he could not now be, except upon the theory of Bagehot that a diplomat must be not only an agent, but a spectacle. Since Pat Egan, nobody would be more of "a spectacle" than Loomis in any conceivable embassy. We are therefore compelled by the severest logic to propose a business career for the fatigued Loomis. A bare hint to Mr. Paul Morton should be sufficient. Lovely and pleasant in their official lives, he and Loomis are in their whitewash not divided.

Americans interested in growing rice are hoping to secure a wider market in Cuba through action on the part of the Cuban Congress lowering the import duty on the article. This is a laudable ambition. We trust it may succeed. But we cannot say that we are much impressed by the chop-stick logic on which the rice-growers base their plea to the Cuban Senate. They aver first, that the United States is facing an annual deficit of $25,000,000; second, that $14,000,000 of revenue is lost through Cuban reciprocity; third, that the offset of $7,000,000 increase in our exports to Cuba is inconsiderable; and conclude that if reciprocity is to be extended beyond the original five-year period, the American rice-grower's good will must be bought by lowered taxes on American-grown rice. The chain of reasoning is logically a rope of sand. Because we spend $25,000,000 more than we raise by taxation, Cuba, forsooth, must examine her own conscience whether she is paying her due share of our taxes. The "sacrifice" of $14,000,000 revenue assumes jauntily that the Cubans and not our own sugar consumers are the beneficiaries of the reduced rate on Cuban sugar. Finally, our gain through reciprocity is calculated solely on the ground of the small increase in private profit of our exporters. And the conclusion, that we shall not again be outwitted in a reciprocity treaty with Cuba unless the favor of our rice-growers be bought by a low rice duty, is a crowning piece of inconsequence savoring of blackmail.

It will be worth watching how far the Senate will incline an ear to suggestions of tariff reciprocity when the retaliatory shoe begins to pinch certain industrial interests. The Chinese boycott on American goods provoked at once an executive order softening the asperities in the administration of our exclusion law. There is some reason for believing that the rigors of the law itself may be realized and softened when Senators learn that the pocket-book nerve of their constituents has been touched. Moreover, the advisability of tariff concessions may be borne in upon the Senate afresh when the new German tariff becomes operative. Its double line of duties is admirably constructed as a diplomatic club. So, the United States does not like the new higher level of duties on agricultural products? The Imperial Government will be pleased to give us the benefit of the lower duties, if we can arrange a little concession on German products. Our State Department is said to have informed Baron Speck von Sternburg, the German ambassador, that it is futile to offer new reciprocity treaties to the Senate while that body continues in its present state of mind. The Ambassador, however, is in the fortunate tactical position of being able to sleep soundly over the matter, and to let us walk the floor.

One can easily picture the satisfaction of a wheat-grower in North Dakota as he reads the assurances from Washington that the new German tariff will not, after all, hurt anybody in this country. He notes that the duty upon wheat will be 49 cents a bushel instead of 23. The corn-grower, too, will know how to appreciate the rise on his product from 10 cents to 31 cents a bushel. Though Germany raises the duty on fresh beef from $1.62 a hundred pounds to $4.87, and on salted or pickled beef from $1.84 to $6.45, the farmers are reminded, for their comfort, that copper and cotton are still admitted free. The duty on lumber is to be increased about 75 per cent., that on machinery very materially, and on mineral and cottonseed oil also. Still, there is a fractional reduction in the tariff on builders' hardware, to cheer the lumbering, milling, farming, and livestock interests. Crude phosphates for fertilizers will still be admitted free of duty, so no wonder that the *Tribune's* Washington correspondent's optimism is boundless. He should be asked to speak before the coming reciprocity convention at Chicago, where an imperfect understanding of the beneficence of our retaliatory tariff policy is likely to be betrayed.

Last May the Bureau of Manufactures was instigated to begin an active effort on the part of the United States Government to establish lines of large and swift steamers between American and Brazilian ports. The ostensible purpose was to afford an enlarged market for our manufactures in Brazil. The Bureau requested an expert opinion from Mr. Lincoln Hutchinson, its special agent, who, in a hard-headed reply, simply demolishes the whole foundation for the subsidy scheme. In his old-fashioned and wholly unemotional analysis, Mr. Hutchinson says he doubts the utility of the proposed stimulus to our export trade for two reasons. The first is, that Brazilian importers assert they never have any more difficulty in obtaining goods ordered from New York than in getting goods from London or the Continent. The second reason is, that the countries trading with Brazil which have recently made the greatest effort to stimulate steamship facilities "have been the least successful in holding their Brazilian trade." England, France, and Germany have experienced of late a greater shrinkage of their trade to Brazil than has the United States. Mr. Hutchinson concludes that our freight facilities are adequate, and makes a home thrust at the extension of Government functions by adding that our present mail service to Brazil might be greatly improved. A more complete ex-

posure of the hollowness of the subsidy grab could not be desired.

A national quarantine service is brought distinctly nearer by the appeal of Louisiana to the Federal Government. When a city and a State where jealousy of national control in such matters has been strongest, throw up their hands and implore the authorities at Washington to take charge of the fight against yellow fever, the end of merely local and conflicting safeguards against a national invasion of epidemic disease cannot be far away. The President's response was prompt, but guarded. He telegraphed the Surgeon-General to do everything in his power to aid Gov. Blanchard, and to "notify me what further action is advisable and possible for the Federal authorities." Congress will undoubtedly be called upon to make the powers and duties of the national Government larger and more precise in all that relates to oversight of the public health. This is the way in which constitutional changes gradually come about in this country. A crying practical need presents itself, and then we adjust the law of the land to meet it. On purely theoretical grounds, the change would be opposed; but the concrete emergency carries off the argument triumphantly.

The transfer of all the forest reserves from a division of the Interior Department to the Forest Service in the Department of Agriculture, and the consequent consolidation of all branches of the national Government's forest work, were accomplished by an act signed by the President on February 1. For some time there had been a rather clumsy system of coöperation by which trained foresters were detached for service in the reserves; but the change obviously makes for efficiency. How great is the area now set apart under Government control to protect the watersheds and incidentally furnish a future source of fuel and timber, is hardly realized here in the East. Mr. Gifford Pinchot, in a recent article on "Forestry Abroad and at Home," gives 63,308,319 acres as the extent of the sixty-two reserves on January 1. Among those established in the last six months is the Lassen Peak reserve, in California, of nearly a million acres. Another, in the State of Washington, is said to have "half the size of Connecticut," while a Denver newspaper recently figured that the forest-reserve area in Colorado has been increased since January 1 from 2,903,460 acres to 8,252,619. These alone would bring the total up to some 70,000,000 acres—that is, considerably larger than New York and Pennsylvania combined, with Connecticut and Rhode Island thrown in. Nor, for practical purposes, can the activity of some States in creating reserves of their own be ignored. New York has one a little larger than Rhode Island, and Pennsylvania one of about half that extent, while Michigan and Minnesota are named by Mr. Pinchot among other States that are following the same policy.

The astonishing figures of traffic through the ship canal at Sault Ste. Marie, given wide publicity in connection with the celebration of the fiftieth anniversary of its opening, should remind us that *we* have under way some necessary canal improvements. It was a favorite argument of those who opposed the project to widen and deepen the Erie Canal in 1903, that water transportation could not compete with railways, and that canal construction was a particularly foolish waste of money. But the "Soo" has accommodated a volume of traffic which has increased from 14,503 tons a year to more than 35,000,000, with an average annual increase of 20 per cent. The lesson has not been lost upon Canada, where in recent years some $87,000,000 has been spent on artificial waterways, $30,000,000 going to the construction of the short Welland Canal that locks boats past Niagara Falls. Work on the Georgian Bay Canal, designed to cut out the long Lake Erie détour, has been pushed vigorously, and Montreal's share of the grain and ore shipping of the Northwest will, upon its completion, be further increased. A considerable part of Canada's gain is, and will continue to be, New York's loss. If anything can serve to impress upon the State authorities the importance of pushing the work on the Erie Canal, it should be the "Soo" celebration.

Little attempt is longer made to conceal the fact that both political parties drew upon that mysterious $685,000 Equitable loan. A management which distributed its favors between Depew and Hill would naturally see to it that the treasuries of either party did not go empty. Treasurer Bliss of the Republican National Committee resents as "improper" the question whether any Equitable money was turned over to him. But his sensitive delicacy must not animate the investigating committee of the Legislature. They must drive such questions home, and not be too nice about it. The very fact that political as well as financial scandals are to be inquired into, puts the investigators upon their honor to go to the bottom. We hope their honor will be spur enough; but it is not a bad thing that Jerome stands behind ready to prick them on if their honor is in danger of becoming somewhat Falstaffian.

Mrs. Clarence Mackay's election to the School Board at Roslyn shows at least one way of solving the question of what to do with our women of wealth to keep them from boring themselves and their kind to death. We sincerely trust that this excellent example will be followed, if only to arouse greater interest in school elections. In too many New York towns and villages, school affairs are still in the hands of those whose idea of a public school is a cross-roads shanty with a single ill-fitted and plodding teacher. Some knowledge of the strides made in pedagogy is requisite, and to be conscious of them by no means indicates a passion for "fads and frills." But, aside from this, women of leisure and culture ought to find work of this kind increasingly attractive; they have the time that few men have, and, fortunately enough, they care very much less for political influences than they do for the proper education of children. Incidentally, Mrs. Mackay's election brings to mind again some of the inconsistencies in woman suffrage. In New Jersey, women may vote on school appropriations and may serve on school boards, though they may not vote for members of these boards; in Massachusetts the case is reversed. In New York the suffrage carries with it the right to vote for trustees and on appropriations, and service on the boards is permitted. On the other hand, women property-owners may vote on questions of taxation in villages and towns, but, inconsistently enough, not in the small cities.

The Pennsylvania Legislature, at its recent session, authorized the Governor of that State to communicate with the chief executives of other commonwealths for the purpose of securing uniform divorce laws. Accordingly, communications have already been addressed by Gov. Pennypacker to Gov. Higgins of New York and to Gov. Stokes of New Jersey. These States, and doubtless all the others, are requested to send representatives to a congress of delegates which is to meet in Washington, and will attempt to draft a general law to be sent to all the governors, in the expectation that it will be submitted to the favorable consideration of all the State legislatures. The responses from the two contiguous States have been, on the whole, cordial; and while Gov. Higgins disclaims authority to appoint delegates to the convention in question, he has referred the matter to the New York commissioners for the promotion of uniformity of legislation in the United States, and has expressed the hope that the commissioners may find it possible to attend the projected congress. Whatever the specific outcome of this movement, it evidences the general feeling that uniform legislation in this matter is highly desirable.

The colored people of Florida are jubilant over a decision of the Supreme Court of that State declaring unconstitu-

tional the "Jim Crow" street-car law which became effective on July first. There are two street-car companies in Jacksonville. One, owned by Boston capitalists, is reported to have paid $10,000 to prevent the passage of the bill. The other is largely owned by colored people, and was not affected by the boycott immediately instituted against the Boston company. Similar action was taken in Pensacola, the negroes there refusing to ride in cars which were divided for the races. A colored law firm of Jacksonville, Messrs. Wetmore & Purcell, at once prepared a test case, their belief being that the law, which also conferred police powers upon the conductors, was contrary to both Federal and State Constitutions, violating particularly section two of the Fourteenth Amendment to the Federal Constitution. Their contentions were upheld by the Circuit Court, and, four days later, by the Supreme Court of Florida—a result which pleases the railroad companies quite as much as the colored people, and may easily result in attacks on similar laws in other States. An amusing feature of this case was the giving to the negroes the front seats in the cars of the line owned by colored people, and placing the "white crow" section in the rear—an arrangement which naturally appealed to the humor of the colored folk.

On July 15 Brussels was *en fête* in honor of the seventy-fifth anniversary of Belgian independence. Belgium can point to a great increase in population (from 3,700,000 to 7,000,000) and in wealth since 1831, and has doubtless made a distinct place for herself. Her Congo venture, as to which the balance, whether pecuniary or moral, cannot yet be struck, has given her a name among the nations, though it has not substantially improved her international relations. Indeed, what has been called "the gravitation" of Belgium towards Germany has probably been due in part to resentment at English criticism of Belgian methods on the Congo. Fear, too, that England would not effectually guarantee Belgian independence, in case of another war on the Continent, has something to do with it. There seems to be as yet no ground for such panic as Demetrius C. Boulger expresses in the *Nineteenth Century* over the prospect of Belgium dropping into the outstretched hands of Germany; but the inclination of Brussels to look to Berlin rather than to London is clear.

Trouble continues smouldering in Crete. "Taken on deposit," in M. Hanotaux's phrase, by the European Powers, that island has not in all respects behaved as its protectors fondly hoped. The people have shown a vexing desire to say what sort of government they wish. They have for years desired union with Greece. The appointment by the Powers of a Grecian prince as High Commissioner in Crete seemed to the inhabitants a distinct encouragement of this long-standing hope of theirs. Yet no sooner do they begin to express their preferences, though in somewhat violent fashion it must be admitted, than all the talk is of stern repression. A recent dispatch from Rome said that Russia regarded the Cretans as practically in a state of insurrection, and was, characteristically, for putting it down roughly. The Italian Government, on the other hand, was for the familiar but futile remedy of a "pacific blockade." But none of the obstacles placed in the way of the popular will can long avail, provided it still be true that "the unanimous and unconquerable desire" of the Cretans is for a union with the Greeks in a single nation.

The revolt in German Southwest Africa obstinately declines to be put down, despite the fact that it has been officially declared ended quite as often as our own "ladrone" fighting in the Philippines. So far, the cost to the German Government of this year and a half of war has been about 65 millions of dollars and fully 1,000 lives, while the real end is not yet in sight. The German officers plan the most scientific traps, but the prey manages to wriggle out somehow just when it is officially reported as "wholly surrounded." Conditions in the colony are about as unhappy as could be imagined. The loyal natives complain that they are abused, the settlers are very angry at the high-handed methods of the military, business is almost at a standstill. The army authorities enforce the most despotic military rule, in the course of which they recently suspended the only newspaper containing news of the insurrection, because of its criticism of the official management. Thus the settlers are left in absolute ignorance of what is going on, and the soldiers vent their ill-humor by blaming the English for permitting Cape Colony to be a recruiting-ground for the natives. It is also alleged that the English authorities fail to disarm the followers of Maharero when they are driven across the border, and permit them to return to the warpath when rested and refreshed. Altogether, the spectacle is one which should afford much food for thought among Imperialists the world over.

Jules Roche, in a recent article in *Figaro*, reviews the German budget. He complains of its intricacy and complexity, as contrasted with the budgetary statements of Great Britain, and, while admitting that the French budget is not blameless in this respect, declares that it has never attained the *magnifique incohérence* of the German. The complicated character of the German budget statement is due to two facts. First, the German Empire is a federal State, and transactions between the Imperial Government and the twenty-six constituent States make a simple statement of financial conditions difficult. Second, Germany is engaged largely in industry, such as railroads, coal mines, and the like. This results in swelling the figures of both gross receipts and gross expenses. M. Roche, however, is able to disentangle the following facts about German finances: Their total is steadily growing; the items that embrace the greater part of the increase are expenditures on the army and navy; the principal of the public debt is steadily on the increase. As illustrative of these tendencies he cites the following totals of the expenses of the Imperial Government:

1874	841 million francs
1894-95	1673 million francs
1904-05	2549 million francs

The Imperial army expenditure for 1905-6 is set at 79 millions in excess of that required for the current fiscal year; the naval expenditures promise an annual growth of 31 millions for the next budgetary year. The debt of the Empire and the constituent States was, in 1901, 16,728,000,000 francs. Since then, in the debts of the Empire, of Prussia, and Bavaria alone, the increase has been 1,797,000,000 francs; and the total today is near 19 milliards.

Lord Curzon made it very plain in his speech at Simla on July 18 how near the Balfour Government came to receiving his resignation in connection with the Indian army administration issue raised by Lord Kitchener. The Viceroy frankly stated that this question was originally referred to him by the Home Government seven months ago, with a request for the Indian Government's opinion. A month before, to his intense surprise, he not only ascertained that his advice "had not been so fortunate as to meet with the acceptance" of the King's advisers, but also found himself instructed to "introduce without delay a form of military administration" of which he "learned only for the first time in the dispatch of the Secretary of State." Naturally, Lord Curzon was incensed, and, also naturally, he made such a vigorous protest that Balfour found himself compelled to withdraw the offensive plan or to lose Curzon's services. He promptly backed down; or, to put it more politely, "accepted the modifications" offered by the Viceroy. Inevitably, this method of governing India has not made a very favorable impression either there or at home. Moreover, it makes ridiculous the Balfour pretence that his Government should be retained because of the alleged ticklish condition of foreign affairs. A blunderer at home can blunder even worse abroad.

HOUSETOP DIPLOMACY.

There have been peace conferences many, and plenipotentiaries have met before, but we doubt if the world's history up till now can show the sort of diplomatic shouting from the housetops to which we have just been listening. It is certainly a complete break with the old tradition. Good or bad, wise or foolish, the customary way of envoys on a special mission has been to maintain impenetrable reserve. Doubtless this has often led to a false reputation for wisdom—"accounted wise for saying nothing." But even those diplomats who really had something to say when they opened their lips, have felt it both prudent and decent to do their first talking to their fellow-negotiators in secret. Louis Napoleon, it will be remembered, made the mistake of underestimating Bismarck, when the latter was Ambassador to France, because he was so "open" in his conversation. That was an innovation which did not always work well even in Bismarck's skilful hands. The general rule has remained as Lord Salisbury described it—four men sitting down at a table, to settle quietly and secretly international controversies.

Democracy, publicity, the modern press have changed all that, apparently. Diplomacy has to be, not merely popularized, but plebificated. Secrecy is intolerable. Reserve is almost an insult. Oriental calm and Tartar stolidity have both to yield to this rising and imperious demand that everything be blabbed. We have had daily a sort of duel between the diplomatic representatives of Japan and Russia. Interview responds to interview, and statement answers statement. It is a sort of furious but long-range bombardment. Tokio is reported one morning to be enraged because St. Petersburg talks of the possibility of continuing the war. The newspapers of either belligerent country and of neutral nations are filled with contradictory accounts of what Japan's terms will be, what Russia's maximum, and what the final result will be. The fact that M. Witte takes a ride in an automobile, or visits the Stock Exchange, is cabled to Russia as a "good indication"; while the Japanese were triumphant, if we may believe the reports, over the announcement that President Roosevelt was to receive them a half hour in advance of the Russians. The novel thing is, not that we should have such enforced or sought publicity—we are accustomed to it nearly everywhere else—but that it should be annexed to the most serious diplomatic negotiations. If this is modern diplomacy—diplomacy by megaphone—it gives fresh point to Coleridge's taunt, "Your art diplomatic is stuff."

Of course, there is little or nothing really revealed in all the clamor. The man in the street thinks that he knows the thoughts of Komura's heart and the self-communings of M. Witte, whereas in fact all that he has before him is a mass of confused rumor, unfounded assertion, and unauthorized speculation. The surprising thing is, however, that the parties to the negotiation have seen fit to add to these untrustworthy oracles. They seem to have deliberately darkened counsel by words without meaning. Mr. Sato has had his carefully studied interview every day, recurrent as the sun. The Russians have given him as good as he sent. Little that a reasonable man can attach importance to has emerged in all the noise, but the noise itself has been unprecedented. At the Congress of Berlin, every member was pledged to reticence in advance and sworn to secrecy at the time. Even our own peace conference at Paris in 1898, after a war which had been conducted very much as a form of newspaper advertisement, was a model of dignified reserve compared with the preliminary clatter of the Portsmouth conference. The new diplomacy seems full upon us.

That there may be compensating good in it we do not deny. We shall not quarrel with those who see in it an appeal to the considerate judgment of mankind. Both Russia and Japan may be forgiven if they are anxious to stand well with the civilized world. Perhaps all their initial skirmishing in the press is to be interpreted as a proof that they recognize the existence of a great court of international opinion, and are anxious to assure their standing in it. It is profoundly true, we believe, that there is to-day a consensus of humane minds throughout the world, and that no nation can afford to disregard, much less defy, it. Yet it is the final result at Portsmouth, after all, and not all this thundering in the index, which will have to be submitted to the verdict of civilized nations; and we cannot but think it would have been better for all concerned if there had not been so much diplomatic beating of the air in advance.

Democracy seems to demand more and more that everything be done in public. It is impatient to know and to bruit abroad what is whispered in the ear in the closet. But it has got to be taught, or to learn by bitter experience, that some kinds of public business cannot be transacted in mass-meeting and with brass bands. It is of the essence of diplomacy to be delicate, confidential, secret—at least in the early stages of an important negotiation; and, if we are now going to insist upon an echoing publicity, to demand that plenipotentiaries live in glass houses, think aloud, and entrust their official cipher to the reporters, we shall be destroying what has long been, and may long continue to be if let alone, a most useful instrument. Even democracy has to delegate power to somebody, and trust him to be discreet and closemouthed in affairs of high import; and if Hotspur's saying ever comes to be read, "Secret thou art, but yet a diplomat," there will be an end of diplomacy.

OVERHAULING THE CIRCUMLOCUTION OFFICE.

A well-known college professor complained recently that when he told people that he lectured on "Administration," nobody knew what he meant. The lay graduate supposed it was a new-fangled name for some course in politics, while practising lawyers assumed that it meant the administering upon estates of decedents. Even when the student of *Verwaltungslehre* explained that he was lecturing upon "the administration of government," the far-off look in the eye of his auditors convinced him that the phrase carried no definite message to the bewildered inquirer. Despite the domestication of the term "administration" in our political vocabulary, the word commonly connotes the personnel of the executive department, and not the art of conducting governmental business. We are just awaking to the fact that there is an art of coördinating and managing public business with economy, dispatch, and strictly located responsibility. It is our realization of this fact that explains the recent creation, by the President, of the Committee on Department Methods.

Our tardiness in appreciating the importance of scientific administration is to be explained on historical grounds. Our governments, State and Federal, were charged originally with such modest tasks that the various bureaus did not very frequently impinge upon each other. Moreover, the prevalent individualism of our earlier history created such almost universal habits of self-reliance and bold initiative that the ordinary successful American citizen was presumably a skilful administrator. Private business had been the school in which our early class of competent bureaucrats got their training. But even in those halcyon days there was not wanting evidence of dry rot in Government bureaus. John Randolph, chairman of the Ways and Means Committee in 1807, wanted an explanation from Secretary Robert Smith concerning certain items in the navy estimates, and described his experience thus:

> "The Secretary called up his chief clerk, who knew very little more of the business than his master. I propounded a question to the head of the department; he turned to the clerk like a boy who cannot say his lesson and with imploring countenance beseeches aid; the clerk with much assurance gabbled out some commonplace jargon which I would not take for sterling; an explanation was required, and both were dumb. This pantomime was repeated at every new item, until, disgusted and ashamed for the degraded situation of the principal, I took leave without pursuing the subject. . . . There was not a single question relating to the Department that the Secretary could answer."

It is sincerely to be hoped that our Cabinet ministers to-day are better informed than the victim of John Randolph's hectoring. They will else make a bad fist in returning answers to the one hundred and seven printed questions which the Committee on Department Methods has fired point blank not only at each Department, but at each bureau and division thereof.

The present situation in our executive departments has resulted in large part from the rapid growth, and frequently the very unsymmetrical growth, of different bureaus. The curious medley of tasks entrusted to the Treasury until the recent creation of the Department of Commerce and Labor illustrates the case. Lighthouse inspection, Alaskan seals, and supervision of immigration had been tacked seriatim to the previous fiscal functions of the Treasury, and there were a dozen other jobs falling to the Treasury fully as alien to its proper field of action. But, besides the growth of the departments, the necessity of precluding corrupt methods carried with it a certain check upon administrative facility and dispatch. To make sure that money did not get into the wrong hands, a series of artificial hurdles—audits and counter-audits, vouchers, and warrants—was erected to trip up the nimble but erring sixpence. In similar manner, to prevent offices from becoming spoils, pure and simple, civil-service examinations were set, and the sifting process, though immeasurably helpful to the morale of the Government employees, was a trifle slow. What we gained in purity, we partly lost in speed. And unfortunately even the merit system cannot guarantee that a crust of bureaucratic custom shall not form on the surface of government activities.

It is said to be President Roosevelt's discovery of these mal-adjustments, and his impatience with red tape, which led to the appointment of the Committee on Department Methods. Their inquisition seems to be directed along very promising lines. A few sample interrogatories will illustrate:

> "(2.) What is the division of responsibility between the Secretary, the Assistant Secretaries, and the chiefs of bureaus and divisions?"
>
> "(8.) Is any work done by any other Department in any field covered by your Department? If so, is there any systematic form of coöperation?"
>
> "(18.) What procedure and policy are followed in making up departmental estimates for appropriations? Is any committee concerned with this work?"

And under the general heading of Correspondence and Files is this home thrust: "(19.) What proportion of answers is mailed the same day the letter is received?"

It may readily be imagined how the somnolent departmental dovecotes are being fluttered by this unfeeling intrusion. The dust was so picturesque, and the mantle of mutual charity for each other's lagging gait had become so all but universal! It even appears that the investigating committee suspects that in certain musty quarters of Washington there is an odor of hateful academicism, for one query desires light on there being "any persons in your Department engaged in preparing decisions for ministerial approval who are without expert and practical knowledge of actual conditions. . . . as distinguished from a knowledge of the record alone."

Enthusiasts for Government control of industry may profitably turn aside a moment to consider that this inquiry is virtually an attempt to inject into Government business administration the virtues of private or corporate management. We can but hope that the investigation may secure for the executive departments the desiderata they now often lack—definitely located responsibility, coördination of departmental work, due economy, avoidance of unnecessary duplication of function, and such reasonable speed as is consistent with honesty in public business.

THE PUBLIC VIEW OF MORMONISM.

Not in a long time, certainly, has the Mormon Church had so prominent a place in the news of the day as at present. Not only are there unmistakable signs of a strained situation in Utah itself; over the Western States in general—the East seems less interested—the feeling is apparent that things are not as they should be and that something ought to be done.

In a sense, we are now passing through a sort of secondary stage in the agitation over Mormonism. The early testimony in the Smoot proceedings made familiar to every one a mass of highly damaging facts about the Church and its leading spirits. In a word, it taught the country what the Church stood for and to what its potential authority extended. The effort of those fighting Mormonism is now to show in detail the ways in which this power is being exercised at present in every-day affairs. Until the country in general is completely convinced that the Mormon hierarchy not only can but does habitually exercise despotic control over the Church membership, to the prejudice of others' rights and in violation of its own agreements, it is idle to talk as yet of the third stage, when we should seriously consider applying a remedy by force from without. If the anti-Mormons can do no more than show that the Latter-day Saints have a fantastic and terrifying ritual, are led in an extremely close communion by a coterie of rich old men with several wives apiece, and usually let themselves be told how to vote, the good people over the rest of the country will be properly disgusted, but they will hardly be roused to an embattled mood.

It is in this light that the current allegations of Mormon machinations have their special interest. Last week, for instance, registration for chances in the Uintah Reservation lands began at Provo, Price, and Vernal. Salt Lake, the largest city in the State, was not included. Here is seen a Mormon plot, for, in Salt Lake City, Gentiles are in the majority, and by removing the places of registration to Mormon centres the chances of the non-Mormons in the scramble would be diminished. Out of the Uintah opening another scandal was scented in the recent letter from one of the Mormon "stake" presidencies, referring to "Land Office connections." Commissioner Richards at Washington promptly wrote to ask what was meant by the expression. The answer, sent a fortnight ago, explains that the Church officials merely meant that they were "in touch with Land Office attorneys and civil engineers operating in the legitimate exercise of their professions and under the rules and regulations governing opening of the reserve." The stake presidency protests that it used the phrase "without noting that it was susceptible of double construction."

It may be remembered that when President Smith was testifying before the Senate committee, he was asked about the case of a man who, after being long in charge of certain Mormon educational work, left it to become a professor in the State Agricultural College. The implication of the question was that the change was a punishment inflicted by the Church. President Smith's answer was, in substance, that the State Agricultural College was a far more important institution than any which the Church maintained. This statement may be recalled in view of the recent charge that the Mormon leaders are plotting to capture the institution, that several of its professors are now polygamists, and that, if the plans go through, the institution will be made as far as possible an adjunct to the Smoot-Cutler political-religious machine.

But the list of evils alleged is almost endless. We have the case of a Mormon forger arrested in Canada, but protected by the refusal of Utah's Mormon Governor to issue a requisition for him. There is the story of a Gentile saloonkeeper whose license was revoked, and who was visited a few days later by a Mormon, who proposed to rent the place, saying, "You could not get a license, but I can, because I am a member of the Church." We read accounts of the means by which independent salt-makers—Mormons themselves—have been crushed by the power of the Church monopoly. There are even tales of Smith's unfeeling treatment of widows and orphans left by dying Mormons to the charity of the Church. We have thought it worth while to cite these charges as illustrations of the systematic effort now being made to impress on the country

what Mormonism is in practice as well as theory.

In the midst of this wrangle, Frederick W. Smith, grandson of the original "prophet" Joseph Smith, and head of the "Reorganized" Church (for the head of the Utah body carries on the line only in name), comes out with an address to Mormons urging them to abandon at once polygamy, commercialism, and politics, and return to the faith as it was before corrupted by Brigham Young. An amusing cartoon in the Salt Lake *Tribune* shows Apostle Penrose, editor of the Church organ, the *Deseret News*, exclaiming, "There is no collision of forces in Utah," though behind him President Smith, a strapping Gentile, and a Mormon schismatic, are rolling over and over in a three-cornered rough-and-tumble fight, while the peaceable Reed Smoot, without taking a hand himself, is knocked hither and thither.

Certainly, all the grumble and rumble and roar would be more impressive if it was directed to some more definite end. "What are you going to do about it?" is in this case the question of the well-meaning bystander as well as of the intrenched hierarchy. Even Senator Kearns, in his impressive valedictory speech on conditions in his State, got no nearer a concrete suggestion than to say: "It is the duty of this great body . . . to serve notice on this Church monarch and his apostles that they must live within the law, that the nation is supreme, etc." But how serve notice? And if they do not obey the notice, what next? Elect State officers who will vigorously root out polygamy and political conspiracies? It was tried last fall, but the anti-Mormon ticket polled only 8,000 votes out of 100,000 or so. The only concrete thing the Senate can do without going out of its way is to unseat Reed Smoot, but the committee seems as far from a report on his case as ever, and the apostle has already rounded out more than a third of his term unmolested.

JEROME'S TRUE VALUE.

We doubt not that most of Mr. Jerome's admirers and supporters could, as we at least do, wish him in some respects other than he is. His address at Chautauqua on Saturday brought out again some of those qualities in him which make the judicious grieve. He said some excessively foolish things. His notions of political economy seem singularly vague. His dismissal of the Philippine question in a contemptuous phrase or two was unworthy of a serious-minded man. But we have to take Mr. Jerome for all in all. We have to see what is essential and central in him, and what falls away as merely exterior and unimportant. Southey said that, as he grew older, he got over his early "mania for man-mending." We must take men as God made them—thanking Him devoutly when a public man arises who, with whatever faults of manner or speech, has the root of the matter in him and deals direct and mighty blows at the giant evils of his day and generation.

Now that is true of Mr. Jerome. The people of this city and of this country are turning their eyes to him, not because they think his taste perfect, or believe that all he says is pure wisdom, but because they know him to be honest and terribly in earnest, because they perceive that he is absolutely fearless, and because they are more and more coming to see that he is striking his hand upon the very spot where the American body politic is most ailing. His description of the way in which bosses have cunningly come between the people and their nominal representatives, answers to the thoughts of many hearts. We have all felt this shame. In a confused but angry way, we have protested against the idea that our boss-made public servants fairly represent the American people. We look about and see our friends and neighbors, honest and self-respecting, as a rule, and desirous of purity and efficiency in government, yet somehow led by the nose into conniving at the worst plans of party machines and their unscrupulous leaders. Community after community, with State after State, feels itself disgraced by the men who are ostensibly the elect of the people, yet the reason for the humiliation, like its remedy, is but dimly perceived. Mr. Jerome, however, comes forward to make all clear. He shows into exactly what trap we have fallen. It is the combination of party tyranny (really the dictation of one man or a small group of men) with graft that is responsible for the disrepute into which our public life has fallen.

And, in elaborating this truth, Mr. Jerome displays a prophet-like directness. No beating about the bush; just a plain, "Thou art the man." It is as refreshing as it is unprecedented to have a man in the public eye make his teachings so trenchantly personal, naming his bad examples with the utmost freedom. Such explicit application of his principles as he made by name on Saturday—Depew, Odell, Platt, Hill, each being treated with a familiarity which must have seemed to them horrifying—is as admirable as it is needed. "I love Moll Cobb for her impudence," said Dr. Johnson; and we think that Americans are prepared to give their hearts to a man who will lay an irreverent hand upon our whited sepulchres. We have had a dearth of this plain-speaking and making guilt personal. The ordinary way has been to construct some roundabout phrase, after the manner of Joseph Surface, and say "the man who," etc., etc. This is the great vice of President Roosevelt's exhortations. But Mr. Jerome has gone about the business with a terrifying way of pointing his finger straight at the sinner. "When I say a Senator is unfit, I mean Depew. When I speak of a self-seeking boss, I mean Odell." No wonder the people hear him gladly.

All that we can reasonably ask of a public man is that he sense the great issue before the country, and be prepared to lead the people aright upon it. The rest is immaterial. Mr. Jerome's occasional slangy habit of speech, the flippant tone which he sometimes adopts, his yielding now and then to the temptation to deliver himself upon subjects of which he has small knowledge, his indiscretions, his mistakes—all these things are of no great consequence. It is enough that he sees clear and thinks and talks straight in the really vital matter. Mr. Jerome's true importance and real value lie in his firm grasp of the fundamental evil of our politics. He has studied the matter long and at first hand. Of the malign figure of the boss, selling nominations with one hand, selling legislation with the other, he has had a near view; and he tells us in the most explicit language we have had from any public man, that our peril and our corruption reside in the arrogance of the party boss and the subserviency of the voters. Throwing his own glove full in the face of the bosses of both parties, Mr. Jerome has made himself the natural leader of all who would see their corrupt and debasing power broken forever.

The rise of such men as District Attorney Jerome and Governor Folk renews one's faith in the ability of democracy to heal its own diseases. When the sickness is most desperate, the physician appears. The first thing we need is a clear diagnosis of the malady. This Mr. Jerome has given us with unexampled precision. The cure which he proposes is heroic—like the plucking out of an eye or the cutting off of hand or foot—but there are abundant signs that the people are ready for it. We can interpret the acclaim with which the whole country has received Mr. Jerome's declaration of independence of the bosses, and of war upon them till they abdicate or expire, in but one way: a political revolution is impending, and woe be to boss or grafter who gets in its way.

HOW THE MAYOR STANDS.

Some of our daily contemporaries seem very despairing of District Attorney Jerome's chances of reëlection if he runs independently. One of them deprecates his assaults on the Republican machine, and thus writes itself down as unable to comprehend the real sources of his strength. This, we think, is not the time for faint-hearted studying of election figures, or for regret that the Tammany vote is so large as it is. It is the moment to give thanks that a brave

man has at one stroke vitalized a campaign which bade fair to be lifeless and even confusing, and has set before the community once more, and in vigorous fashion, the ideals towards which honest citizens have been working these twenty-five years. New York has shown again and again that it has citizens who value courage, independence, and honesty in a civic official. To sit down now and wail over the likelihood that great numbers cannot be shaken in their fealty to national party, is entirely too much like offering the counsel of pessimism, if not despair.

In sounding a call to arms against the bosses, Mr. Jerome has not only brought his own candidacy to the front, but has set people to reviewing the whole Mayoralty situation in the light of the coming election. When Tammany Hall puts a personally honest man like Mayor McClellan in office, it does so for two reasons: first, to deceive voters into believing that it has undergone a moral regeneration, and is therefore entitled to the votes of those who would "reform the party from within"; and, second, to confuse the real issue presented by its mere existence as an organized political body with no higher inspiration than the appetite for public plunder. Mayor McClellan has served these more than dubious ends well—intentionally or unintentionally—with the result that the public mind is seriously perplexed. People have naturally been drawn to the personally attractive gentleman in the City Hall, and have, also naturally, compared his administration far more with Van Wyck's than with Mr. Low's. From that point of view they think the present Administration a great advance. Some innocent voters, too, really think this is the grade of Tammany government we may expect for the indefinite future. Ridiculous as this is, we are, fortunately enough, not facing another "red-light" campaign, and we have been happily spared many of the iniquities of the Van Wyck debauching of our city government.

But when this is said on behalf of Mayor McClellan, there remains little if anything else to be adduced in his favor, while there are many harsh judgments which the impartial student of affairs must pass upon the Administration that he and Mr. Murphy are jointly conducting. First of all, the Mayor himself knows in his heart that he has been false to the city's best interests in retaining in office John T. Oakley, the Gas Commissioner, who sold out to the Gas Trust behind Mr. McClellan's back. He did, it is true, force out a wholly incompetent Tenement House Commissioner, but this only brought out in more glaring way his retention of Oakley and of the insufferable Park Commissioner, Pallas. It in no way relieves him from the responsibility of having foisted upon the city a Deputy Police Commissioner of the character of Thomas F. McAvoy, or a Dock Commissioner like Featherson, to say nothing of the Health Commissioner, who makes scarcely a pretence of excluding politics from his enormously important department. Under these men and their fellows there has been a steady deterioration of the city's service. Mr. McClellan knows it; he has been having some difficult times lately with certain heads of departments, and he has readily understood the significance of the bumps he has received in riding over our worn-out pavements.

None the less, the Mayor has been loyal to his political pals. He has not gone back on "the gang," as did Mayor Weaver in Philadelphia. True, the Durham machine demanded intolerable things, but essentially it is not different from Tammany, and the plaudits of all his friends could not conceal the plain fact that Mayor McClellan has acted up to his natural instincts and served the city faithfully *only so far as compatible* with his staying on good terms with his overlord, the ex-barkeeper, Murphy. When the limit of Mr. Murphy's or the Hall's indulgence has been reached, the city may go hang as far as the Mayor is concerned. Meanwhile he salves his conscience with the Jesuitical doctrine that the end—*i. e.*, the furtherance of his own ambitions—justifies the means, and that, in Rooseveltian language, one must compromise to "accomplish things." In other words, the Mayor has fawned upon his political maker, and is more content to be half a man and Murphy's loyal tool than the city's leader. Who has heard the son of George B. McClellan speak out in these last eighteen months against the corrupt corporations, the real enemies of the city, who are steadily driving it towards municipal management of public utilities, or worse, by reason of their criminal alliance with Tammany Hall and the rotten Republican machine? When has the Mayor essayed the moral leadership of this community—now in Mr. Jerome's hands—as his birth and antecedents gave the public a right to expect of him? Has any one seen in Mr. McClellan an iota of that readiness to fling away his political future by daring to do the right which marks the Jeromes, the Folks, the Clevelands, as the highest type of the American public servant?

Mr. McClellan's Administration is at bottom one of compromise and deceit, intended to gloss over the evils of governing a city by a boss, in order that the independent voters may turn their eyes away from the true standards erected by men like Jerome and Cutting and the honest workers of the Citizens' Union. The one system of government has failed in every city in America, and has made American municipal government a byword throughout the world—like Turkish mismanagement and Russian corruption; the other offers the only hope of conducting our municipal business honestly. Let Mr. McClellan be reëlected, and the downward movement of the new city government will be accelerated. The issue this fall, as in former years, is the people against the criminal alliance of both parties for the purpose of plundering the city. Through Mr. Cutting the Citizens' Union has swung into line behind Mr. Jerome, as everybody knew it would. And it may yet appear that there is a higher duty which Mr. Jerome cannot escape, for the very reason that he himself has so daringly nailed the flag of good government to the mast.

HYBRID DEMOCRACIES.

Democracies which attempt a colonial policy suffer under unusual disadvantages. They cannot very easily justify at the same time their own existence and their usual method of governing dependencies. Monarchies have less trouble in this respect. Where the Crown enjoys substantial power of government, it is easy to extend the same logical conception to the rule of newly acquired territory. Bismarck's dictum that "might must rule before right can" is not ousted of its jurisdiction by a sea trip. To be sure, the absolutist principle has not been proved by historical experience to be reliable. Power without corresponding terrestrial responsibility has on the whole degenerated into neglect and abuse of the governed. But still the doctrine of divine right, or its modern counterpart, suffers no logical dislocation on purely geographical grounds. It is true that the colonies which are dominated under this theory of government have shown little inherent vitality. But, on the other hand, the difficulties they have offered to the home governments have been mainly those of subjugating and policing the "lesser breeds" of alien peoples, not of devising an acceptable measure of self-government for them.

When democracies essay the imperial task, however, the logical dilemma is a vexing one. The opportunist dodge is the only way out of the difficulty. The theory of absolute control is propounded as necessary at the outset. Ultimate self-government, with hazy reservations as to its introduction, extension, and full realization, is dangled as a sedative before the electorate of the seduced democracy and as a quietist incentive before the people of the subject colony. Between the two extremes there is room for a vast assortment of hybrid democracies. There is also the spectacular device of selling the colony an occasional gold brick. This takes the form of a triumphal tour of "pro-consuls," like Lord Milner or "Big Bill" Taft. The duped subjects of a distant sway are thus kept in a lively hope of better

things to come, and the persistent note of discontent is hushed for the moment by the tom-toms of personal welcome. The steady undertone of complaint is stilled, however, only for the time being. The "pro-consuls'" lot is to be misunderstood. As Mr. Kipling tells us,

"Doubted are they and defamed
By the tongues their act set free."

One reason seems to be that the distant subjects of the Empire are wont to regard their freedom as illusory. Take our friends the Porto Ricans, whom we rescued from the tyranny of Spain, for instance. Here the ungrateful fellows are complaining that the executive government named from Washington is as much a tyranny as the Spanish Crown, and that their elective Legislature is very much of a farce. The latest dispatches from Manila bring much the same story. The provincial governors have memorialized Congress, through Gov. Wright, for a reduction of the tariff. They make serious complaints against the constabulary. They desire reform in municipal governments. And, to crown all, the presidente of the Municipal Board of Manila avows in the pro-consular presence that, since Secretary Taft's departure, "the Filipinos as a whole have been dissatisfied, considering themselves insufficiently represented in the government."

A curious parallel presents itself in Great Britain's attempt to give the Transvaal self-government with one hand and to take it back with the other. The debate in the House of Commons on July 27 brought out the curious situation. The "empire-builders" had, by the treaty of Vereeniging, promised that, at the earliest possible moment, the military government should be succeeded by civil government. When the question arose what should be the character of the civil government, the Foreign Office allowed the makeshift of a representative assembly to be elected by the English and the Boers, but superimposed an executive nominated by the Crown. Besides this, the legislative competence of the representative assembly was limited and hampered. The most important powers were removed from its grasp. The salaries and supplies of the executive could not be touched by it, and many of its enactments, even within its restricted area of power, were subject to review and veto by the Crown. A somewhat similar system once existed in Canada. Lord Durham said of it, in his celebrated Report: "It is difficult to understand how any English statesman could have imagined that representation and irresponsible government could be successfully combined." The farcical character of the hybrid self-government of the Transvaal could not be better brought out than by the defence which the Colonial Secretary, Mr. Alfred Lyttelton, attempted. In essence, it was this: that the proposed plan of government was so bad that Boers and English would sink their racial prejudices in a common effort to do away with it. The right honorable gentleman said "he would give the reasons why he thought that the granting of the Constitution in its present form would tend to the obliteration of racial spirit. They had already got, in the agitation for responsible government, Dutchmen acting with Englishmen. [Hear, hear!] If they gained responsible government, the Dutchmen would draw themselves up in a phalanx on the one side and the Englishmen on the other."

This is substantially the justification so often offered for subjecting dependent people to a yoke we admit we could not ourselves endure. It will work out the peaceable fruits of political experience to treat these unschooled peoples to an arbitrary and irresponsible control which matured democracies like ourselves have found intolerable. This complacent and comforting doctrine, however, runs in the teeth of two very unpleasant facts. Subject peoples unrepresented in a governing democracy are very likely to be exploited at the hands of a conscienceless bureaucracy of irresponsible and distant administrators. Either restive discontent or complete atrophy of the national spirit of the colony is bound to ensue. Whatever enlargement they obtain in their rights of self-government is far more likely to come from the trouble they threaten to give the governing country than from a paternally judicious, though gradual, enlargement of their powers of self-direction. The other fact that must be weighed is the reflex action upon the spirit and structure of the democracy at home of exercising even a temporary tyranny abroad. The infection of militarism, despotism, and absolutism is not the least danger to a democracy which essays a rôle alien to its inner life. As we have ourselves experienced, the stifling of the public conscience is attended by a paralysis of the power to resist and to recuperate.

AN ARCHITECTURAL STROLL IN FRANCE.

PARIS, July 26, 1905.

I should advise a person desirous of getting acquainted with the monuments of old France to take as a guide not a dry Baedeker or a Murray, or even one of Hachette's exact guides—very respectable works and full of information—but the books of M. André Hallays. M. Hallays has given himself a mission; he is the champion and protector of the past, and chiefly of the architectural monuments of the past. There has existed since the reign of Louis Philippe an Historical Monuments Commission which has rendered immense service in preserving from ruin the most important vestiges of our national history. A classification of these monuments has been made, much money has been spent for their preservation and also for their restoration. Unfortunately, under the influence of the architects, and especially of Viollet-le-Duc, the work of restoration has often been carried too far; the credits voted by the Commission have often been used more for restoration than for preservation. Architects think it more glorious to repair a column or a door than to cover a roof.

France possesses many rich edifices which are not classed in the official lists—admirable village churches, ruins of old abbeys, municipal buildings, châteaux, private houses. As M. André Hallays justly says:

"They must be saved, first, because they are the witnesses of our history, and also because they give to modern artists the clearest and most healthy lesson; their lines and decorations teach us the true French tradition. The great basilicas and the magnificent palaces which the Historical Monuments Commission has saved, and, alas! restored, have not, for the instruction of our architects, the value of these more humble monuments in which survives, in all its purity, the genius of the builders of old, and which have not been disfigured by the hazardous imagination of restorers."

These views have prevailed already in some provinces, and societies have been formed for the preservation of monuments of this sort. One of these societies has taken for its field the basin of the River Loire; others are in formation for the basins of the Seine, the Rhone, the Garonne. The first acquisition of the Society of the Loire has been the old Abbey of Asnières, situated in the midst of a forest between Doué-la-Fontaine and Montreuil-Bellay. This abbey was founded at the beginning of the twelfth century by a colony of Benedictine monks. Its history is the same as that of nearly all the great French monasteries. The monks begin by being settlers and farmers; they raise cattle, they build houses. The religious wars of the sixteenth century end this period; in the seventeenth century, there are only six Benedictines left; in the eighteenth century, the Jesuits take possession of the nearly abandoned monastery; during the Revolution, the domain is confiscated and sold, the old constructions are demolished, the abbey is turned into a farm. The cloisters have disappeared; there are only a few remains of the chapter room. The transept and the choir of the church still remain, and are, says M. André Hallays, "one of the most admirable monuments of Anjou." The vaults, columns, and ornaments reveal the beginning of the Plantagenet style, peculiar to the province of Anjou, and forming a transition from the Roman to the Gothic manner. This Plantagenet style has no longer the severe majesty of the Roman basilica; it has not yet the triumphant boldness of the Gothic cathedral. The ogive appears here for the first time, and the tracery of the vault is transformed. The builders of the Isle de France will presently invent the purely ogival style, and realize those immense vaults which are admired in the cathedrals. But the *arc ogif* was born in Anjou, and the Abbey of Asnières is its birthplace.

In his promenades M. André Hallays (he has given his volume the too modest title, 'En flânant—à travers la France') visited the church of Cunault, which is near Saumur, on the left bank of the Loire. This church is classed among the "historical monuments"; it is of Roman construction, finished in the Plantagenet style. It was well restored under the Second Empire, by M. Joly-Leterme.

Montreuil-Bellay was visited by M. Hallays not only on account of its old château, which he describes in detail, and the decorative pictures which still exist in its chapel, but also on account of certain recollections of the past. The place was for a time a retreat for Madame de Longueville, who played such an important part in the time of the Fronde. She had seen her army beaten by the royal troops; the château of Montreuil, which belonged to her husband, was the last stage of her adventurous career. Cardinal de Retz has drawn a brilliant and true portrait of her in his Memoirs; and, in our time, Cousin has written a volume on this heroine of the Fronde. She was very handsome, and, says Retz, "she would have had few defects if her *galanterie* had not given her many. As her passion obliged her to put politics only in the second place in her conduct, from the heroine of such a great party she became its adventuress. Grace reëstablished what the world could no longer give her." Was it at Montreuil that she was touched by grace? She left it to go to Moulins, then to the Carmelites, and in the end to Port Royal.

Montreuil was inhabited by the person who suggested to Balzac the idea of writing 'Eugénie Grandet.' Balzac had known at Saumur the Niveleau who became the Grandet of his novel. It is said that Balzac asked for the hand of Niveleau's daughter, that he met with a refusal, and took his revenge on the wealthy miser in his novel; but there is no proof of this allegation. Jean Niveleau was before the Revolution a rag-merchant at Saumur; he lent money at high rates, and bought national properties with assignats. His fortune became very large; he bought the château of Montreuil-Bellay in 1822, and possessed several other domains around Saumur. His avarice was famous; he did not refuse the few sous which the visitors to the château offered him. He had a very handsome daughter, born in 1809, who married in 1830 Baron Millin de Grandmaison, uncle of the present proprietor of Montreuil.

Balzac made numerous visits to Saumur; he was in relations with the sub-prefect, and with a small banker who figures in his novel under the name of "Des Grassins." He was fond of talking in his travels with the people he met in the diligence, and liked much this mode of acquiring information. Three things seem certain to M. Hallays, (1) that Père Grandet was painted from life; (2) that it was in a chance conversation that this type of a miser was revealed to Balzac; (3) that he studied on the spot the surroundings and the heroes of his book.

From the valley of the Loire, M. Hallays leads us to the valley of one of its tributaries, the Loir. This was the land of Ronsard, the greatest poet of the Pleiad.

"Loir, dont le cours heureux distille
Au sein d'un pays si fertile,
Fais bruire mon renom
D'un grand son en tes rives
Qui se doivent voir vives
Par l'honneur de mon nom.

. . . . . .

Si quelque pèlerin arrive
Auprès de ta parlante rive,
Dy lui à haute vois
Que ma muse première
Apporta la lumière
De Grèce en Vendomois;
Dy lui ma race et mes ayeux
Et le sçavoir que j'eu des cieux."

Vendôme and its château are the principal features of this land of Ronsard. The poet has his statue in front of the museum; in the museum itself, there is a plaster copy of a marble bust which was once placed on his tomb. The bust was made when he was old, and little recalls the fine profile which is found in the oldest editions of the works of the poet. Ronsard had a house in Vendôme opposite the hôtel of the Du Bellays. This still exists, but Ronsard's house has disappeared. Vendôme is rich in monuments and memories.

"Of the admirable Abbey of the Trinity," says M. Hallays, "Vendôme has kept the wonderful spire of the twelfth century, the most impressive, perhaps, that exists in France; the proportions of this pile are grand. Vendôme has preserved also its fine church, which is a sort of meeting of all styles, from the Roman to the ornamented pseudo-Gothic, and in which all are mingled in a marvellous whole."

The College of Vendôme, constructed by César, Duke of Vendôme, between 1623 and 1639, was first given to the Oratorians. Louis XIV. made of it a royal military school. The Revolution preserved it as a school, and it became afterwards a "Collège Royal"; it is now a lyceum. The history of this house is a résumé in stone of the vicissitudes of education in France during three centuries. The building, which is in the Louis XIII. style, in brick and stone, is very splendid and noble. Near Vendôme are the remains of a castle of the fifteenth century, with five pointed towers. Its name is Bonnaventure. Antoine de Bourbon, King of Navarre and Duke of Vendôme, resided there with gay companions, one of whom composed a song which is still popular: "La Bonnaventure au gué."

M. André Hallays describes the meanders of the Loir past Lavardin and Montoire; the priory of Saint-Gilles, which was the house of Ronsard. The chapel of the old priory still exists, and dates from the tenth century; it is built in the shape of a Latin cross, and its vaults show remains of ancient frescoes. Did Ronsard ever take holy orders, or did he not? The question has never been thoroughly settled. The château of the Poissonnière belonged to the Ronsard family; his father and mother were buried in it, and Ronsard himself was baptized in it. He was buried in the priory of Saint-Côme, where ends the pilgrimage of André Hallays in the charming valley of the Loir.

Correspondence.

ENGINEERS IN THE NAVY.

To the Editor of The Nation:

Sir: In your issue of the 27th instant, under the caption of "Engineering Conditions in the Navy," you say: "A desire on the part of the Engineers for rank and command was largely responsible for the change"—which, as the word "command" is used in the Service, is, to say the least, misleading.

The Engineers did not ask for more rank than they held, but asked that it be the real thing and not the pretence that "assimilated" rank always was. They never asked for command outside their own department. When they had all they had asked for well within reach, the "gold brick" of the Personnel bill was offered them; they swallowed it with considerable personal gratification to many, and very much to the disadvantage of the Naval Service. The *Bennington* disaster is the legitimate fruit of the system, and we shall be fortunate not to have more of the same kind. It matters little what you call the senior engineer of a ship, so long as he is a man of ability and experience; but, to secure a man of that type, he must have commensurate pay and position.

The first grave error was made in 1882, when the grade of Cadet Engineer was abolished, and with it the special engineering training at the Naval Academy. The sooner special training for engineering duties is put upon a firm basis, the better it will be for our navy. C. H. M.

July 31, 1905.

Notes.

'Sporting Sketches,' by Edwyn Sandys, illustrated by the author, and 'Brittany,' in color, by Mortimer and Dorothy Menpes, are to be published by Macmillan Co.

Brentano's will reissue in a handsome manner Oscar Wilde's 'Intentions,' with an introduction by Percival Pollard.

L. C. Page & Co., Boston, have in preparation 'Among French Inns,' by Charles Gibson.

Dr. Hubert Jansen of Berlin recently made a brief report on the status of the great international Technological Lexicon which has been undertaken by the German National Association of Engineers. It is to be published in three languages, German, English, and French, and especially aims to serve, among other objects, the purposes of translation. Begun in 1901, there have now been worked through nearly 3,000,000 word-slips, and several hundred thousand yet await editorial examination. More than 2,000 firms and individuals throughout the three countries interested and their colonies are contributing material. Printing is soon to be begun.

The annual conference of the editors of the 'Thesaurus Linguæ Latinæ' was lately held in Munich, with the Bavarian Cultus Minister, Dr. von Hartel, in the chair. The general editor, Professor Vollmar, of Munich, resigned his position, being no longer able to devote his entire time to the enterprise, but he will coöperate as assistant editor. The Governments of Prussia, Bavaria, Wirtemberg, Baden, and Hamburg, as also the scientific academies of Vienna, Göttingen, and Berlin, have promised to continue their financial aid. At the above meeting, it was reported that the first volume, A to Amyzon, is now completed and bound.

We welcome the prompt appearance of the first Supplement to the Abridged Edition of 'Poole's Index to Periodical Literature' (Houghton, Mifflin & Co.), under the editorial direction of William I. Fletcher and Mary Poole as hitherto. The mystic number of select periodicals (37) also remains constant, but a gap through discontinuance must be made good in another Supplement or let stand. The present vol-

ume is for the five years 1900-04, and it will be resorted to, as the editors rightly affirm, far more than the portion of the larger work discarded in abridgment. Hence a gain in ease of handling and in cost, in comparison.

The text with which Mr. Theodore Sutro accompanies the reproduction of the late Edward Moran's thirteen marine paintings representing 'Thirteen Chapters of American History' (The Baker-Taylor Co.), is rather injudicious in tone. Mr. Moran was an industrious and respectable painter, but he was not "a genius" nor "the first marine painter" of this country, and the pictures here reproduced are far from "unequalled" as works of art. They are illustrations pure and simple, more at home between the covers of a book than in their original material and scale on the walls of a gallery. As illustrations, they have decided merits, and probably as much value as to truth and accuracy as imaginative illustrations of past events can ever have, but their purely artistic qualities are of a rather modest order. That their production was inspired by patriotism is probable; that they are painstaking, sincere, and conscientious works, there is no doubt. They will be liked for their subjects by thousands of people who are not connoisseurs of art, and with such success the friends and admirers of the artist may well be content.

In his latest book, entitled 'The Complete Kano Jiu-jitsu' (Putnams), Mr. Irving Hancock defends the theory of the Japanese weaponless art of personal defence and physical culture from criticism, and from misapprehensions arising from supposed "victories" of American champions of wrestling over Japanese exponents of their art. His portly octavo is illustrated on almost every one of its half-thousand pages. These clear half-tone pictures, reinforced by descriptive and explanatory text, present the whole subject with absolute fairness. Mr. Hancock calls his scheme "official," and even ascribes it to the Government, besides giving it also the briefer term in Chino-Japanese, newly but properly coined, "jiu-do," and inventing for it, out of whole cloth, the ridiculous attribution of "twenty-five hundred years of history." He has had the coöperation of his co-worker, Mr. Hagashi, and has added, besides prefaces, chapters on the serious and fatal blows, with diagrams showing the vital points of the flesh, muscles, and bones aimed at in attack and reviving. Very valuable is the explanation, with pictures, of Kuatsu, or "The Japanese Science of the Restoration (Resuscitation) of Life," which the reviewer has often seen made use of in Japan with happy effects.

After six years, Dr. J. E. Spingarn's 'History of Literary Criticism in the Renaissance,' which originally appeared in the Columbia University Studies in Literature, has had the honor of being translated into the language of the country on whose influence upon modern classicism most stress was laid ('La Critica Letteraria nel Rinascimento,' Bari: G. Laterza & Figli). It has been somewhat revised and enlarged for the translator, Dr. Antonio Fusco, and Prof. B. Croce supplies a brief friendly preface, in which he characterizes the work as substantially a history of *Poetica*, with but incidental references to Literary Criticism. This, in fact, came truly into being only with the Romantic revolution, as will be shown for Italy in a forthcoming work by G. A. Borgese. Professor Croce also delicately again breaks a lance with Professor Saintsbury, apropos of this scholar's rejoinder to his criticism in the third volume of his 'History of Criticism.'

A belated contribution to the controversy over Dr. Karl Bücher's 'Der Deutsche Buchhandel und die Wissenschaft' comes to hand in a pamphlet bearing the title 'Das Buch im Strom des Verkehrs,' by Dr. W. Koehler-Gera. The author characterizes it as "a study in political economy," and treats in it of such topics as the Economic Importance of Literary Production, the Economic Basis of Literary Culture, Analysis of Literary-Economic Value, etc. A chapter on the Libraries and the Book Industry deals largely with the beginnings of the book trade in Alexandria and the Roman Empire; the author touches also on the possible service of libraries as literary bureaus of information, especially through book exhibitions. The fifth chapter, entitled "Das Reichsbarsortiment," contains a practical proposal to solve the difficulties that beset the book trade. The author, who is himself a publisher, proposes a further development of the cash-jobbing houses (*Barsortimente*), the one branch of the trade of which the soundness had not been attacked during the controversy; he proposes, in a word, the establishment of a large central jobbing-house on a coöperative basis as an agency of the organized trade, with branches in various literary centres. Dr. Koehler is confident that organized effort of this kind will go farther towards solving the book-trade problem than any coercive measures. These, he says, "are of doubtful value in the economic life, and, as disturbing elements, often work against productivity."

Steady progress is being made in the solution of the problem of Japanese origins, not only on the anthropological, but on the linguistic side. When, in 1887, Prof. Basil Hall Chamberlain published, in the Memoirs of the Literature College of the Imperial University of Japan, his great work on 'The Language, Mythology, and Geographical Nomenclature of Japan, viewed in the Light of Aino Studies,' and the Rev. John Batchelor his 'Ainu Grammar,' the proofs of the ancient Ainu occupation of the Japanese archipelago were made clear. Yet, besides at least fifteen points of difference between the Ainu and Japanese languages, there were several score of known place-names which could not then be accounted of Ainu origin. Professor Chamberlain, with some others who preceded him, suggested a pre-Ainu aboriginal race, and in the publications of the Smithsonian Institute are some "astonishing remarks" to this effect by persons who were excursionists rather than scientific men. These imagined a previous race of dwarfs, and asserted that the Koropoku-Guru, or the pit-dwellers of North Japan, were a separate race antedating the Ainu. In a valuable pamphlet, just issued by Mr. Batchelor, he shows that the Ainu people in Saghalien and the Kurile Islands, as well as Yezo, make and use pit dwellings in winter, using huts in summer, and that the Koropoku-Guru (a term meaning pit-dwellers) were Ainu and nothing more. Independently, a work in Japanese, by R. Torii, on the Ainu of the Kuriles, fully bears out the thesis of Mr. Batchelor, and overthrows the official report of the Washington excursionist. The skeletons of no "dwarfs" have yet been found. As regards the place-names once defying analysis or disputed, Mr. Batchelor, after seventeen years of further study, has recovered from the Ainu the real root-meanings of the whole 210, once unknown, and has added 90 others. These, with his descriptive notes, he gives in both the ordinary Japanese and the modern Ainu form, making a list of great value. Mr. Batchelor has also issued in a new edition of his 'Grammar of the Ainu Language' (Yokohama: Kelly & Walsh) some notable fresh results of his studies. Whether he has demonstrated that Ainu is an Aryan language must be decided by experts, but, briefly stated, the Ainu are a white race, physiologically related to the cave-dwellers of Europe, while linguistically akin at least to the Aryans.

The *Korea Review* for May contains an article, perhaps of plenary inspiration, on "Korea and Japan," showing that the Japanese, instead of removing the age-old inheritance of hatred in the Korean mind on account of the twelfth-century raids, and especially the brutality and ruthless invasion of the sixteenth century, have of late increased it. Very naturally this has stirred up a great deal of discussion among the Japanese newspapers. Estimating at small value the good will of the Korean people, the Japanese have not only shot instantly, without trial, Koreans found tampering with the railway, but, in the matter of sequestrating land and labor, have not been generous in keeping promises or in doing what the admiring world believes they are doing. The May article is reinforced by a tremendous indictment (with specific allegations) of the Japanese in the June number of the *Review*. An irreducible residuum in the controversy is the unquestioned fact that Japanese of a very undesirable class are pouring into Korea, whom the Mikado's officers find it hard to control, while the reinforcement of Japan's enormous army in Mantchuria is depleting the supply of labor in Japan itself. The Japanese have also possession of the post-offices, supplanting the superintendence and assistance of the French, bringing many new clerks and operators from Japan. The telegraph and telephone services are now also under Japanese direction. There is an interesting account of the celebration of the opening of the Seul-Fusan Railway on the 25th of May, which excelled in splendor and impressiveness anything ever known in the Empire. This, for the student of Korean matters, is supplemented by special numbers of Japanese magazines liberally illustrated. The American system is used throughout on the Korean railways, and 120-ton Baldwin engines make a nine-hour schedule between the eastern port and the capital in the northwest. The city of Seul had a good spring house-cleaning, and the red sand characteristic of Imperial occasions was sprinkled over all the streets. Under the facile hands of Japanese decorators, many striking designs were noticeable. A thousand guests partook of the banquet which the Imperial princes of two countries attended. The trip from London to Tokio will, in the coming days of peace, require but a few hours of sea travel. An enormous appreciation of land values has already been felt all along the lines. The first number of the

Seul *Press*, a weekly paper in English, appeared on June 3.

The higher education of women in England will be promoted by means of a memorial to the late Miss Frances Power Cobbe. Funds have been subscribed for an annual prize to be given to all students and members under six years' standing in certain colleges for women, including those at Oxford and Cambridge. These prizes will probably be for the best essay on any subject, ethical, psychological, or philosophical, bearing on the evidence of natural religion. The committee of ladies in charge of this scheme believe that such a prize, open to such candidates, would "be an appropriate means of continuing the work as well as perpetuating the memory of a representative woman distinguished for her wise advocacy of the rights of women to equal treatment in higher education as well as in the broad field of civic life."

The problem of the unemployed workingman is discussed in a report of a committee of investigation appointed by the French Chamber of Deputies. The main cause of this enforced idleness, which the Socialists insist is due to the capital system, is attributed to machinery. The introduction of mowers, reapers, etc., has rendered it impossible for the small farmer to make a living, and has driven him to the city. "In Paris, two-thirds of the population is composed of these emigrants." A remedy is suggested by calling attention to the manner in which Russia has successfully created new means of labor by fostering domestic industries. Of these, there are about fifty, such as locksmithing, shoemaking, painting icons, etc.; and by this means from $38,000,000 to $58,000,000 are distributed yearly among the rural population. In 1900 an appropriation of over $50,000 was made to aid these country industries, called *kutsari*. The Minister of Agriculture helps the establishment of factories for apprentices, and of schools, warehouses, and salesrooms, in which scholars may be trained. There is at St. Petersburg a permanent exhibition of *kutsari* products, a species of industrial museum which sends models, drawings, and perfected instruments into the country, and serves also as an intermediary between the rural workers and foreigners. As far as possible, the State reserves to the *kutsari* the manufacture of certain Government work, military harness, etc. The committee introduced a bill providing for an appropriation for the purpose of investigating the general subject, and for a special inquiry into "the kinds of industry that may be carried on in families or in small village factories that will furnish complementary resources to the farm hand."

Following the innovation successfully tried in Berlin, an *Arbeitsamt* has been established for the university students in Munich. The Association (*Studentisches Arbeitsamt*) offers to secure, through capable students and young savants connected with the University, such work as the transcription of manuscripts, preparation of excerpts and digests, investigation of original sources, collection of literary references, preparation of articles, reviews, and the like in the departments of science, literature, and art. A similar bureau of information has been opened in Florence, the "Istituto delle Carte," with a national scope.

The first International Art Congress has been called to meet in Venice September 21 to 27. It is convened at the initiative of the Circolo Artistico of that city, and an international committee has been selected to arrange the programme and the work.

A national Rumanian Exposition will be held next year in commemoration of various historical events. In 1906, writes our Minister, Mr. John B. Jackson, eighteen centuries will have elapsed since Dacia was conquered by the Emperor Trajan, and the Rumanians profess to have issued from a fusion of the conquerors and the conquered. In 1866 the present king began his reign as prince, and next year twenty-five years will have elapsed since Rumania became a kingdom. The Exposition is intended to show the product of Rumanian industries only, whether of inhabitants of the kingdom or of other countries. Foreign exhibits, however, are to be admitted which have to do with agriculture, especially of machinery, and of fruit and vegetables whose introduction into Rumania is considered possible. The Parliament has voted the sum of $320,000 for the organization of the Exposition.

—The August *Scribner's* is, as usual, the "fiction number." There will be some, perhaps, so carried away on the wave of popular enthusiasm for Japan as to count Mr. Millard's paper on the fruits of Japan's victory fiction along with the rest, but a voice of caution and dissent may be useful, none the less. It is Mr. Millard's opinion, shared doubtless by many others, that the channels of information have been very shrewdly managed in Japan's interest for the past few years, until public opinion has become unduly biassed. The course of events proves, he thinks, and well he may, that Japan intended the war with Russia long beforehand, and had very definite ideas as to the way in which it was to be brought about and the time when it was to come. Russia, on the other hand, by her very unreadiness, showed that she had no idea of a war at that time, though it may have been regarded as an inevitable part of her policy for a somewhat indefinite future. Under present conditions, thinks Mr. Millard, it is idle to suppose that Japan will be content with the modest programme put forth as a justification of her course when the war began. She will demand "the legitimate fruits of her victory, in the usual military sense," and Western nations must govern themselves accordingly. Mr. Millard insists that Russia and Japan were on the same level, so far as *rights* were concerned, in the original dispute. It was merely a matter of national interests and ambitions, with no rights involved except the utterly disregarded rights of the inhabitants of the territory in question. He also maintains vigorously that the Russians and the Japanese are far more essentially like one another in inherent character than the "propaganda" has allowed us to believe. It is to be said that there is nothing essentially pro-Russian in Mr. Millard's attitude, since he endorses emphatically the general severe criticism of Russian methods of administration.

—The *Atlantic* yields rather more than its accustomed amount of recognition to the vacation season. "The Lesson of Balzac," however, by Henry James, gives ample opportunity for vigorous intellectual effort to any who are so inclined. This will be remembered as a lecture delivered in Philadelphia and elsewhere during the past eight months. George W. Alger makes a protest against the current "literature of exposure" as being ineffectively severe in manner, and failing to supply the constructive element along with the destructive. It may be admitted that there is much violent screaming in fashion on the subject of social and political abuses, but we are not quite sure that the man who happens to have a keen scent for fire should keep his mouth closed until he be assured of his own competence to put out the fire and repair the damage as well as to sound the alarm. This is the era of the division of labor, and there is a place for the man who can detect danger and sound the alarm, regardless of his ability to do the rest. "Above the Clouds at Metéqui," by Anna Seaton Schmidt, is an unusually interesting bit of description.

—'The Classics and Modern Training,' by Dr. Sidney G. Ashmore (Putnams), is, in its author's words, "a series of addresses suggestive of the value of classical studies to education." Of the five essays which the volume contains, the first two bear more directly upon the present importance of *literæ humaniories* than do the rest. These are "A Plea for the Classics in Our Schools, with Particular Reference to Latin" and "Our Classical Inheritance." The remaining papers are entitled "The Tragedy and Comedy of the Greeks," "Classical Archæology," and the "Olympic Games at Athens in 1896." One is always interested to see how an advocate of classical studies will base his plan for their inclusion in the curriculum of school and college. So much has been written on the subject, and many of the considerations are so obvious, that it is by no means easy to avoid being dull and hackneyed when dealing with such a well-worn theme. Dr. Ashmore, who is writing to convince the public rather than to embroider fine phrases about the beauty of the Greek and Roman masterpieces, seeks to ground his argument upon a truly scientific basis. Hence he enters the realm of physiological psychology to ascertain what light is thrown upon language study in general by the organization of the human mind. Having established, by an appeal to this new oracle, "the supreme importance of language study to early education, he examines in succession the special claims of English, of the other modern languages, and of the classics. Here one of his main points is that inflection gives Latin a disciplinary value which English cannot claim to possess. "The Roman could arrange his thoughts in their exact logical sequence—that is, in the order of priority of importance, without risk of ambiguity, and he could do so because the language he used was highly inflected. English, on the contrary, being now almost wholly deprived of whatever inflections it once had, must depend chiefly upon the arrangement of its words to avoid obscurity of statement, so that a truly logical order in English is seldom to be guaranteed." Having drawn his main arguments from psychology and grammar, Dr. Ashmore concludes by calling as witnesses a number of modern educational experts like Dr. M. P. Jacobi,

Prof. F. S. Hoffman, and President Hadley. There are two important points to be urged on behalf of classical training which have been unduly neglected in this article, namely, the great service rendered by Latin, when properly taught, in the formation of an English style, and the difficulty which the average mind has in grasping the rudiments of scientific methods before sixteen. But Dr. Ashmore does not pretend that he has covered the whole field in this short address, which has the distinct merit of shunning loose talk and laying stress upon more sensible arguments than are usually employed in the debate between classics and science. The other four essays bear witness to Dr. Ashmore's genuine appreciation of classical literature and archæology, as well as to his sympathy for modern Greece.

—We have a volume of very different scope, though also devoted to the classics, in the 'Companion to Greek Studies' which Mr. Leonard Whibley has edited for the Syndics of the Cambridge University Press (New York: Macmillan). This is a valuable coöperative work designed to present "such information (apart from that contained in Histories and Grammars) as would be most useful to the student of Greek literature. It differs in scope from other books of the same class, for, besides a survey of Greek life, thought, and art in their different branches, it includes a chapter on the physical conditions of Greece, another containing chronological tables of politics, literature, and art, and a chapter on certain branches of criticism and interpretation. "While each article has been entrusted to a writer who has made a special study of the subject, it has been the aim of the work to give the substance of our knowledge in a concise form." These words taken from Mr. Whibley's preface help to indicate the purpose and scope of what must have been a serious undertaking. It is not possible, however, for an editor to commend his work so completely as the reviewer can do, and we hasten to say that the present book is a *Grundriss* of the utmost worth. While likely to be used for the most part by scholars, it is not beyond the range of any educated person, for it states results with the utmost clearness, and avoids such a citation of evidence as would divert the attention of the unlearned reader. Where sources and authorities are necessary "to establish an argument, to justify an important theory, or to remind the student of the *locus classicus* of the subject," they are quoted freely enough for the purpose, but we have never seen a book in which less space is wasted. To say that Mr. Whibley has had on his staff all the best Greek scholars of Great Britain, might seem in one or two cases to be a slight exaggeration. What can be said with the strictest accuracy is that no editor at Oxford or Cambridge could have hoped to secure a stronger corps of contributors from his own country. The geographical section is written by H. F. Tozer; Literature and Textual Criticism, by Sir Richard Jebb; Architecture, by the late F. C. Penrose; Prehistoric Art and Sculpture, by Dr. Waldstein; War, by Professor Oman; Medicine, by Dr. Clifford Allbutt; Metre, by Dr. Verrell; the History of Scholarship, by Dr. J. E. Sandys; and Constitutions, by Mr. Whibley himself. These names are but a choice selection, for a galaxy of scholarship is represented in the elaborate and highly classified table of contents. Where so many writers are concerned, and where compression has been carried so far, it is difficult to single out particular subjects for comment or criticism, but as a standard of true and luminous statement we may allude to Sir Richard Jebb's section on Epic Poetry, in which the development of the Homeric question from Wolf to Christ is handled with masterly skill in a few paragraphs; and the Drama, in which we are taken from the dithyrambs of Arion to the comedies of Menander in thirteen pages of critical narrative. There is no large subject in Hellenic life, from the origins to the Byzantine period, which is not touched upon in this brief encyclopædia, and few volumes have a stronger claim to their places in the library of the classical scholar.

—Mr. Kosmo Wilkinson's 'Personal Story of the Upper House' (Dutton) is a comprehensive and readable account of the leading nobles who have adorned the British peerage since the thirteenth century. So far as the book has any special motive beyond conveying information in an easy and agreeable manner, it would seem to aim at emphasizing the idea that the House of Lords was at the outset a popular assembly, and still remains in close touch with the life of the realm at large. The recent revival of aristocratic influence, encouraged by Lord Salisbury's policy though not springing from it, is a feature of modern British politics that no observer can overlook. Mr. Wilkinson, on the last page of his book, quotes approvingly this dictum of Lord John Russell, "a statesman whose popular sympathies never permitted him to forget his patrician descent": "When a great question arises which requires a display of more than ordinary knowledge of history, of specially accurate learning, of constitutional wisdom particularly practical and sound, what is wanted can be found nowhere in greater perfection than on the episcopal bench, among the peers of three centuries of nobility, and the recent occupants of the Woolsack." But if there is to be seen here a disposition to lay stress upon the virtues which the House of Lords possesses as a deliberative body, Mr. Wilkinson does not make a plea on behalf of the aristocracy, or allow himself to be blinded by any sense of factitious greatness. Beyond doubt, the House of Lords can show a galaxy of illustrious names and picturesque careers, when these are selected from the crowded annals of five centuries; and although at every period a larger number of its members have performed their legislative duties lightheartedly, or not at all, the Upper Chamber has never lacked in its ranks true leaders of the community. The legal reports given in the *Times*, under the heading, "Probate, Divorce, and Admiralty," often contain evidence of a different character which must be reckoned with in forming a final judgment regarding the value of an hereditary aristocracy. However, we have no intention of entering here upon such an exhaustive subject, and only allude to it because Mr. Wilkinson's sketches of individual peers leave on the mind a somewhat too favorable impression of talent and patriotism. In point of form the book is anecdotal without being anecdotal merely. For each age the leaders of the aristocracy are singled out and depicted in a series of brief biographical notes. The thread which holds the narrative together is slight, but of sufficient strength to prevent the book from being a collection of jottings. We have said that Mr. Wilkinson writes agreeably. He also shows a considerable range of reading.

—'The Courtships of Catherine the Great,' by Mr. Philip W. Sargeant of Trinity College, Oxford (Lippincott), is, the author assures us, not to be considered a book of scandal; and this claim, if so it may be called, is borne out by the character of the contents. The title itself is a somewhat gentle euphemism—one must not look here for a repetition of the highly spiced tales with which the memoirs of the eighteenth century are crowded. Catherine's love affairs, of course, went beyond all ordinary bounds of "indiscretion," and it is not strange that her amours should have been represented by contemporaries as being more vulgar than they actually were. Still, there is always the difference between truth and fiction, and it is useful to have in English a statement on this subject which covers the ground already traversed by Waliszewski and his followers on the Continent. Mr. Sargeant starts out by grouping Frederick of Prussia, Maria Theresa, Catherine the Great, and Voltaire as the outstanding figures of the eighteenth century; "and of them all," he says, "Catherine is the most fascinating character." Concerning this *obiter dictum*, we shall say nothing save that it furnishes the reader with Mr. Sargeant's point of view. Of new information in his book there is virtually none, but the graver dangers into which a writer on Catherine's relations with men might easily fall, are avoided. The fact is that the number of her "favorites" was more restricted than the public imagines, and few of them had any direct effect upon State policy. By far the most important of the ten or twelve suitors whose affairs with the Empress come into the present volume were Gregory Orloff, the chief actor in the plot of 1762, and Prince Patiomkin. Catherine's dealings with Orloff, though extended over a good many years, centre in the deposition and probable assassination of Peter. We think that Mr. Sargeant goes too far when he says: "The accusation against her of ordering her husband's assassination is only put forward by the scandalous, the disreputable, or the utterly prejudiced." As in the case of Darnley and Mary Stuart, there may still be some room for doubt, but the facts point strongly in one direction. "The possibility still remains," continues Mr. Sargeant, "that Peter was slain entirely without her knowledge, but that she condoned the deed when it was done. Certainly, she made no attempt to punish any one." Catherine's action in rewarding the foes and probable murderers of Peter can hardly be got over; and when we consider the importance of the issues at stake, and the character of Catherine's intelligence, it is unlikely that a matter of such moment as Peter's fate should have been left undetermined. The period of Patiomkin's ascendency, which began about 1775, belongs to a less tragic and more prosperous era. Out of the seventeen years during which his connection with Catherine lasted, he was "palace favorite" only during the first two, afterwards controlling, or at least influencing, very

largely the choice of the *cicisbeo*, while taking the leading rôle in politics himself. According to Mr. Sargeant, the Empress is to be looked upon as "non-moral"; but, despite the credit we must give her for generosity and political good judgment, we think she gets off very lightly at this estimation.

—Some at least of our readers will be familiar with the correspondence which was conducted during the years 1844-1854 between Mr. William Palmer, fellow of Magdalen College, Oxford, and M. Khomiakoff. Allusions to it occur in the autobiography of Palmer's brother, the first Earl of Selborne, and at the time it attracted a good deal of attention in ecclesiastical circles. The attempt which was made at this period to establish intimate relations between the Orthodox and Anglican communions proved a failure, since the Greek Church would not recognize the validity of Anglican orders; but in a certain section of the Anglican Church there may still be seen the disposition to meet those of the Orthodox faith more than half-way. Thus, in 1893, the Eastern Church Association, which had been founded nearly thirty years earlier, was revived after a term of eclipse, and since then this society has put forth at intervals volumes designed to promote the cause which in the last generation was so dear to men like William Palmer and George Williams. Its most recent publication is a short book entitled 'The Orthodox Church in Austria-Hungary,' by Margaret S. Dampier (Rivingtons). Strictly speaking, we have here only the first instalment of a work which doubtless is designed to cover the same ground that was traversed by Archbishop Schaguna in his 'Geschichte der Griechisch-orientalischen Kirche in Oestreich.' The author begins with a brief account of the Rumanian Church in Transylvania before the Union of 1700. This act of adhesion to Rome, although signed by fifty-four arch-priests and over fifteen hundred priests, did not lead to the extinction of the Orthodox faith among the Rumanians of the Hapsburg allegiance, and, after a good deal of friction during the eighteenth century, Joseph II., in 1783, granted that those who declined to recognize the headship of Rome should have their own bishop, with his see at Hermannstadt. As the Rumanians of Transylvania are extremely poor and ignorant, their progress since the days of the philosophical Joseph has not attracted much attention outside the Dual Monarchy. However, they are a remnant of some interest, both ethnically and ecclesiastically. This book is a piece of compilation which draws most from Schaguna, but is also indebted to several other writers on the Siebenbürgen. Though much condensed and somewhat bald, the narrative has the merit of an intelligent abridgment, and if the writer had not connected the battle of the Lechfeld with the name of Otto III., and placed the battle of Mohács in 1516, we should have had no fault to find with her abstract of historical events.

A FRENCH VIEW OF RUSSIA AND TSARISM.

L'Empire Russe et le Tsarisme. Par Victor Bérard. Paris: Armand Colin. 1905.

M. Bérard's contribution to the flood of literature on Russia must be ranked as not only "timely," but also as of high class and valuable—three qualities not often found combined. He dates it "January-May, 1905," which brings it as near the present moment as it well can be. A notable feature is the manner in which, without straining comparisons, he judiciously explains the connection of past and present history as he proceeds. This sort of thing has been done—or attempted—before, it is true, but not felicitously, as a rule. M. Bérard appears to be as free from prejudice as one could expect, and very well informed as to cause and effect. The single point on which he is rather weak is on Church matters, which is not surprising on the part of a member of the Roman Church; while, though he gives but one side—the Jewish side—of the Jewish problem, omitting counterbalancing statements on the Russian side, it cannot be said that he is unfair, since some of his quotations come from Russian communities, and most of them are less hackneyed than usual.

He first deals with "Religions and Nationalities," having laid a foundation of geographical and historical causes in "The Land and History." The comprehension of all these points is greatly aided by an excellent triple map (in color), which sets forth boundaries of land, climate, races, and religions. He sums up comprehensively and effectively the general problem in regard to the vitally important treatment of the annexed races and religions as follows:

"What treatment shall be accorded to them? What shall be made of these annexed peoples? Slaves or equals? Enemies or co-workers? This question presented itself at the end of the eighteenth century, on the day when Catherine II. took her share of Poland, and it has never since been possible to misunderstand its vital importance for the duration of the Empire. But, for a century, replies have varied with the autocrats who have followed one another at Petersburg. In this regard, Russian history of the nineteenth century may be divided into three periods: the first extends to the Polish insurrection of 1831; the second lasted from the Russo-German disagreement, which followed the Treaty of Berlin, until the death of Alexander II.—say about 1881; the third is still in progress. The first beheld the triumph of the liberal, or at least, intelligent and generous ideas of Alexander I. The second was an era of repression, which was, no doubt, cruel and irritating, but tolerant by fits and starts, often blind or indifferent, never aggressive (except in Poland). The third is nothing but a systematic persecution, crushing suppression; the official language calls it Russification."

The author then quotes the words of Alexander I., to the effect that it would be advisable to endow Poland with liberty, in order to preserve it from becoming, in the future, a plaything in the hands of the first fools who should happen along; and remarks: "If the ideas of Alexander I. have not prevailed in the Western 'march,' they still preside over the conduct of the Russian Government on the Eastern 'march.'" He instances the diplomatic results of liberal treatment in the case of the Buddhists—the semi-nomad Kalmuks, and the Buriats of Siberia, who, in their wanderings, have borne the fame of Russia's greatness into otherwise almost inaccessible regions, with the outcome that the good understanding (possibly a formal alliance) which unites the Tsar to the Dalai-Lama of Lhasa, has exerted occult influence upon his temporal vicar, the Emperor at Pekin, brought Mantchuria under the Russian power, permitted a Russian subject to be established as first secretary and minister of the Dalai-Lama, and "driven English imperialism to the two follies of the Thibetan expedition and the Russo-Japanese war." To the influence of the Dalai-Lama, M. Bérard attributes also the failure of the Japanese to hurl the Mongol tribes on the rear of the Russian army. "When the war is over," he continues, "and Mantchuria is recaptured or lost, the Dalai-Lama, under the hand of the Tsar, will be the best instrument of the Russo-Japanese alliance or of the Russian revenge, the costs of which, as one can foresee without being much of a prophet, England will have to bear." The liberally treated Mussulman has become a loyal Russian subject.

The plain moral drawn from these and similar cases is, that similar treatment of the nationalities in the Western "march" would have proved equally profitable, while from those Western provinces, in close contact with Western civilization, Russia could have appropriated the valuable fruits of experiments which other nations have hastened to copy. In view of recent revelations in various countries which, unlike Russia, never were afflicted with a Mongolian invasion, it may strike the reader as undue favoritism on the part of M. Bérard to assert that Russia's system of procedure in financial matters is a direct inheritance from the Tartar yoke of the 13th and 14th centuries. "What she calls administration we Westerners term graft and extortion," he says. He suggests studies in Finland on the subject of liquor license and honest public administration; in the Baltic provinces on German discipline and science—though he admits that Russians have considerable reason for their dislike to the natives of those provinces who have so eagerly and numerously grasped all desirable employments and posts. Poland he calls "the Slavonic France," asserting that the Poles possess the Gallic temperament, with all its qualities and defects. "What a useful, what a necessary complement to the Byzantized, Mongolized, Germanized Slavonia of Kieff, Moscow, and Petersburg would be this Latinized, Gallicized Slavonia of Warsaw!" he exclaims; and he argues that Russia and Poland united would form a complete nation, from the literary as well as the political point of view. "Only the foreigner, the German, has had occasion, and may yet have further occasion, to rejoice over these family dissensions, which all interests should moderate."

From the utilitarian standpoint the author regards the treatment of the Jews as a mistake. The contented Jew might have proved, in the hands of a sagacious Government, a more useful instrument in the "great design" upon Constantinople and Jerusalem than the contented Buddhist has been in Lhasa and Pekin, and he thinks Israelite capitalists of the whole world would have defrayed the expenses of a Russian attack in that quarter had the Government treated her Hebrew subjects equitably. Services of like description have been lost among the Armenians of Turkey and Persia by a similar shortsighted policy. At this point, M. Bérard administers a resounding blow to the policy of

several nations. "The Napoleonic chimera still rules over the universe," he says. "Napoleon-Bismarck [why not N.-William?], Napoleon-Chamberlain, Napoleon-Roosevelt have attained, or are candidates for, apotheosis."

Under the section "Russification," M. Bérard treats of the different annexed peoples at length. On the whole, his remarks are very fair and intelligent, but are occasionally open to criticism. In the case of Poland, he quotes an article ten years old, by a Roman Catholic writer in the *Revue des Deux Mondes*, concerning the reconciliation of the Roman and the Eastern Catholic churches. "This reconciliation is in the nature of things, and it is not necessary to be a great prophet to predict that it will be accomplished one of these days." On his own part the author suggests that this reconciliation would, possibly, "suppress the linguistic persecutions, by covering the national languages with the ritual mantle. It would finally lead to the restoration of local usages and privileges, by that same ritual protection, wherewith it would legitimize or cover them. For, in the bosom of the unified Church, Rome would not seek to stifle national churches." As to this hope, it may be said that it would require a very great prophet to predict reconciliation on any such grounds; that the question of "local usages and privileges" is not a matter of experiment, but of unfortunate historical experience, ready to hand, on the part of the Uniates; and that the substitution of "a ritual mantle" of language would be a distinct and enormous step backwards on the part of churches which already enjoy their service in the antique vernacular of each.

On political matters the author stands on firmer ground. He confesses that Germany, while disclaiming the intention of Germanizing her Poles, "maintains firmly this principle: All those who are subjects of a German State ought to be Germans"—which is the American principle also, though the same principle on the part of Russia is reprobated. But he accentuates an interesting difference between the Russian and the German attitude towards the Poles. "The Russian tortures the Pole, but he does not despise him, he even does him the honor to fear him. . . . The German despises the Pole; by the mouth of his professors he proclaims him a barbarian, a Slav—which expresses everything—inferior in language and culture; and, in the mouth of the Berlin politicians, the Pole is nothing more than an animal, simply a prolific and harmful 'rabbit,' which devastates the land of Germany, or mines it with his secret burrowing." In the author's opinion, the recent Russian defeats in the East will serve to demonstrate to the Poles how necessary to their welfare is economic and governmental solidarity with Russia, since the great factories of Poland lacked orders as soon as the war began; and separation, with the natural corollary—a tariff wall between Poland and Russia—would be fatal to their commerce.

The cause of the Jews is most interestingly and cleverly pleaded. "Only religious reason can be invoked against him [the Jew]," it is said, in summing up. If this statement is intended as an allusion to the kahal, it may be allowed to pass, for the kahal interferes with the laws of the Empire, which must, of course, be paramount. In any other sense it does not represent the facts. Again, it is indubitable that the execution of the famous "May Laws" entailed much distress. But M. Bérard, in common with other writers, fails to perceive that, in the majority of cases, the sufferers had been reaping the benefits of breaking the laws, often for many years, and were deliberately taking the chances of continued non-enforcement of them; whereas, they could have escaped the hardships of unannounced enforcement by settling their affairs at their leisure, during the years which preceded such abrupt enforcement as is complained of. The Russification of Finland and Armenia, with Governmental procedures (of a particularly extraordinary sort, supported by sworn testimony, in the latter case), is briefly but sufficiently set forth.

In treating of "Tsarism," in the last third of his volume, the author takes an interesting attitude:

"Far from being a specifically Russian product," he asserts, "we may say that Tsarism was imported, bit by bit, from abroad; that external necessities implanted it, then developed its rôle and prerogatives, made of it strength or weakness, according as these external necessities were themselves tightened or relaxed. . . If we wish to find in our history of France a symbol or summary of the career of Tsarism, we must think of the series of grandeurs and decadences which led Bonaparte from the humble beginnings of Brienne to the splendors of Austerlitz, then to the bloody declines of Eylau and Moscow, to the final fall at Waterloo."

The historical summary of the rise of "Tsarism," which follows, is extremely able, and brings the reader down to the present day, including accounts of the recent strike troubles, the programme of the various political parties, and Imperial rescripts and decrees. The author has accomplished his task so well, with such manifest intention to be just, that the sequence of events and the logic of the situation are remarkably clear, and, for that reason, his book is unusually valuable.

MORE NOVELS.

The Accomplice. By Frederick Trevor Hill. Harper & Brothers.

The Tyranny of the Dark. By Hamlin Garland. Harper & Brothers.

Jörn Uhl. By Gustav Frenssen. Translated by F. S. Delmer. London: Archibald Constable & Co.; Boston: Dana Estes & Company.

The Millbank Case. By George Dyre Eldridge. Henry Holt & Co.

The Wine-Press. By Anna Robeson Brown. D. Appleton & Co.

Partners of the Tide. By Joseph C. Lincoln. A. S. Barnes & Co.

The Venus of Cadiz. By Richard Fisguill. Henry Holt & Co.

'The Accomplice' teaches that when jurors on murder trials walk abroad between sittings of the court, they may hear and see things which will embarrass them in the performance of their duty, particularly when the judge sternly refuses to discharge them though they cry aloud that they have tasted of the fruit of the tree of knowledge. Foreman Lambert, in the case of the People vs. the Murderer of Gregory Shaw, did vast rambling and love-making in the intervals of professional duty. It was, to be sure, at times complicating, yet in the end led to good, which included the acquisition of a vivacious wife, who was a fine horsewoman and, after a ride, said she felt "bustingly buoyant." No wonder that the lawyer failed to hypnotize a foreman so breezily protected. In view of these advantages, possibly the next advance in legal usage will be the adoption of a new jury system, "instead of which they go about the country shooting ducks." There is a marked absence of the gruesome in this cheerful little novel of murder and courtship. Furthermore, the solution of the mystery is not without originality. To divulge the surprise would be to rival the crime. The reader who is not too insistent on courtroom probabilities, will find some entertainment in following the clue to the end, and may justly perceive a certain cleverness in the tilts between the prosecutor and the counsel for defendant.

Hypnotic influences are the main motive of Mr. Garland's interesting novel. But it ends a chapter too soon. The reader would like to hear definitely whether the spiritualistic manifestations made through the medium Viola Lambert were all of hypnotic origin; whether, removed from the influence of Clarke, Viola became a normal girl, or whether the rappings still pursued her in spite of her scientific guardian. The young scientist who carried Viola away from her servitude as a medium, had had a severe tax laid upon his well-established incredulity when megaphones floated about in the air telling family jokes, and when ancestral wine glasses made their way out of glass cabinets at ghostly bidding—to disclose the medium, when all was done, tied and sleeping beyond even scientific cavil. Therefore, in spite of the rescue of the maiden by the microbe-hunter, it is impossible not to wonder if they lived thenceforth happily or spookily. It would be wholly unjust to dismiss Mr. Garland's book as a commonplace contribution to the question of spirit manifestation. It is written in a fine frenzy of enthusiasm for science and scientists, and there is a tingle of poetry in its proclamation of the meaning behind each new-found germ of life—a noble war-music in the pæans and laments for the heroes and martyrs who face the perils of discovery. To be candid, the scientific portions of the book are the finest and the most absorbing. They suggest a new era in novels—what Stevenson calls "the mysterious inwards of psychology." Perhaps it is the effort to make a thoroughly natural book out of a preternatural subject that has let fall upon the characters and conversations a garment of homespun. Perhaps, says the spirit which questions, it is that no tale of the table-tipping, rope-bound phases of the occult can escape the taint of the ridiculous. Family affections and hypnotism are, however, wholly dignified themes, and when bacteriology walks between, there are ingredients for absorbing reading. This Mr. Garland's book furnishes—for half a volume. When it comes to the test "séance," it is comparatively easy for the reader to turn down the midnight lamp. The author has aimed artistically in making his two principal "spiritists" men who are not all knave, but mixtures of self-seeking with sincerity of longing after their dead. They are repulsive, but they are built on human feeling.

Freely offered advice to the English reader of 'Jörn Uhl' is to skip the story and read the reflections and sermons, even though this be materially to reduce the 400 pages. What an excellent preacher and pastor must be Gustav Frenssen! In him is found what joy in the light spaces, what insight into the dark corners of humanity! And how much he knows of the life of a Frisian farmer and of the operations of the farm! How dreary and sordid the one—how grimy and crude the other! If anything can be uglier than his sorrows, it is his joys. His superstitions even, to which we look for the poetry of a people, are lumpish; his loves and his hates raw; his life and his death a record depressing, distasteful, alkaline. For Germany this is the book that "took her by storm." Its author "awoke to find himself famous." His "books had aroused much hostility among the orthodox Church party, and in 1903 the poet-preacher gave up his pastorate and retired to the beloved and homely Holstein village of his youth, henceforth a free man, to devote himself to literature." "It is a living book," says the translator. "It is a book so throbbing with real life, passion, and poetry, that we overlook in it those epic liberties of narrative on account of which your pedantic critics so damn it." Thus the two points of view, the German and the non-German, are not likely to agree. The personal equation will be as wide as the miles that stretch between the races. Fatigued by the epic digressions, the English reader will hardly attain to that "second reading" which the translator promises "will reconcile us to much that at first glance seemed arbitrary and inartistic in the development of the story." In the instance of the fine description of the battle of Gravelotte, history would amply justify the epic digression; as it happens, too, there is an even more moving justification than history—namely, the absence of history; the panorama of battle as it affects not the men who make the quarrel, but the men who do the fighting—the peasant's portion. A few such pictures would seem enough to abolish war. Those excursions, let it be repeated, which are inspired by religion and philosophy, are their own hearty excuse for being.

Murder stories plainly call for a second reading, to make sure that the means justify the end. To look at the last page first is an affront to the author, pardonable only when the book is too trifling to be read at all. The final disclosure in 'The Millbank Case' is well-contrived, and so is the mingling of side issues with the murder motive. The light is thrown here and there prominently on the immaterial in beautifully misleading fashion; the various threads so contributing to the tangle as to heighten the likeness to a real criminal mystery. Incidentally, there are scenes from loggers' camps that give a touch of landscape as background. The story is fluently told, and is not ungenial, as murders go. Character-drawing is not to be too closely looked for where each person is simply a feature of a case. The detective wears his customary garb of lenses and feelers, yet does not dazzle with excess of Grandisonian light. The stationer's evidence at the coroner's inquest still leaves one wondering how the judge's posthumous statement could have been written on paper not manufactured till after the judge's death, unless, indeed, the stationer, like other characters in history, lied.

'The Wine-Press' is a study of the *Ewig-Weibliche* as influenced by the *Ewig-Männliche*—more concisely, the soul history of Jack and Jill. Of Jill as she emerged a few decades ago from Jack's age-old tyranny and began to be a college girl. Of her brave and honest endeavor to live her own life and to do her own tasks while eliminating Jack from the problem, since she could not eliminate him from the earth. Of the views of Jack upon this theory. Of Jill's tumbling down. Of Jack's efforts to help her up, and of the broken crowns for which at the last Jill herself brings the vinegar and brown paper. The story thus outlined appears trite. In reality the edge of obviousness has been modified by the heredities and surroundings in which the author has entangled her heroine. Here is Giovanna, half New England, half Italian, coerced into the position of guardian to the half-sister whose father has forsaken Giovanna's mother—that half-sister a flighty, worthless child of sin. Her training in a New England college urges Giovanna to austerity, her Italian blood cries out for vengeance, not on men who betray, but on all men—because all betray. Truly, poor Giovanna, with her lineage, her education, and her experience, is a battleground for forces swooping up from a score of directions, a hundred distances, with a great pivotal clash. To give any verisimilitude to so complex a struggle, to picture a species of Lucrezia Borgia pouring tea at a girl's college, a Stream of Tendencies keeping house in a New York flat, is a rugged undertaking. It is due to Miss Brown to say that she has been most conspicuously successful where her task has been the hardest; namely, where the homely and the tragic confront one another. Where weakness chiefly lies is in the limp into commonplace situation which all her ability has not averted. The reader's spirits sink a little when the doctor, the child, and the governess meet on the terrace; when the child discloses grown-up secrets in the way of all the artificial children of fiction; when the doctor shows the skin of a Rochester, but the voice of the analyst, vivisecting himself, not as do the Rochesters, but after the manner of the sex which invented the Rochester and set him up to be adored; greatly subjective about his own objectivity, peering inward at his own powers of striking out. A threadbareness of phrase comes as a surprise, too; the "stifled yawns," the excessive hair, eyes, and graces of the young person are a water-torture not worthy of a writer whose brilliant sayings are as spontaneous as they are frequent. Her college portraits are vivid, but have not brought the day we still look for when deans shall use aright their future tenses. Very charming, quite aside from the story, is the setting of the closing scenes—a Maine coast village with its pungency of climate and characters. Entirely to be praised is the resultant tone of a novel which deals in extreme cases. That woman is woman, and man man, is the conclusion reached through many and miry ways. But there is a rider to the moral. "You and I," says the doctor, "are character and character as well as man and woman. I hate this pitting of one against the other, when nature means us to pull together harmoniously." "You'll find a man breaks down from overwork trying to satisfy some woman, quite as often as the woman suffers from his vices or his indifference. I repeat, it's an individual question." So much for the wisdom of 'The Wine-Press'; for its wit may be taken this single example from many: "She was . . . a type which . . . takes for sensitiveness a somewhat unbalanced tendency to be personal." The portrait of the lady Dean—delicate, vague, limited, literary, benevolent—is a masterpiece in tones of silver-gray.

The Old Salt is a more sophisticated being than he used to be. He uses Wellerisms, to which one instinctively attaches a land association; he is consciously "funny" where his predecessor used to be unconsciously quaint. Through steam tugs and the telephone he has learned the slang of cities, and grafts it upon the dialect of his coast and his calling. And to these modern attachments he has added (or, as he would probably say, annexed) a new tract of qualities. He quibbles a little, smuggles a little, over-reaches a little; without being the bad man of the plot, he is ready for tricks. But if he is Captain Titcomb in 'Partners of the Tide,' he is brought to see the error of his ways by his younger, more straightforward partner. Luck having been with him, he says in the last page that he is very glad he has been good. The book is rural drama of the sort that appeals to the rather old and the rather young. The senior partner is not so wholesome a hero as the older-fashioned salt for our boys, who are quite as ready to be impressed by the comical side of a funny captain as by his turning turtle into rectitude. For the adult there is humor of the domestic sort that lives in sea-coast kitchens and best parlors. For all there are re-glimpses of an old friend, Captain Eri, and very good reading in the spirited story of anchors lifted and wrecks floated. The Cape Cod atmosphere, out-of-doors and in, liberally enswathes the drama; and in the final scenes of adventure the interest mounts to a goodly height.

'The Venus of Cadiz' is an extravaganza. The author has laid the scene of his story in Kentucky; his native bent is American, but his literary method is French, suggesting a study of About and other masters of this vein, and the contrast between the scene and characters and the method is sometimes startling, sometimes fatiguing. It is a rollicking and impossible tale, in which the author gets rather beyond his depth, while the reader is just sufficiently amused to flounder after him in astonishment.

LAMPRECHT'S WHAT IS HISTORY?

What is History? Five Lectures on the Modern Science of History. By Karl Lamprecht, Professor of History in the University of Leipzig. Translated from the German by E. A. Andrews. The Macmillan Co. 1905.

Before entering on his criticism of these lectures, the reviewer might file a caveat against error; for only a thoroughly assured critic will assert that he understands Professor Lamprecht's teachings in all their

parts—which do not always harmonize—or that he expounds them according to their author's intention. Professor Lamprecht has a clumsy method of presentation, even for a German *Gelehrter*, and he adds to the difficulty by much elusiveness of demonstration and by an awkward terminology.

The upshot of his doctrine is contained in two sentences: "History in itself," he says, "is nothing but applied psychology. Hence we must look to theoretical psychology to give us the clue to its true interpretation." From this point of departure he proceeds to range over the evolution of races, nations, and civilizations. The psychologist, we are led to infer, can take any individual person, and, after subjecting him to regular laboratory tests, can predict exactly what that person can do, think, or feel. Simply extend this procedure, says Professor Lamprecht, from the individual to the mass, and you have the solution of the problem of the mass at any given period. Your individual's "dominant" may be music—very good; psychology knows just what reactions a musician is likely to experience. So the "dominant" of your mass, or nation, or "epoch of culture" may be now Subjectivism, now Conventionalism, now Typism, and of course you have pigeonholed all the necessary data for those or other isms.

To discover the "psychic core" or "dominant" or "mass-psychic"—which seem to be nearly synonymous terms—becomes, therefore, the chief business of the historian. He puts from him the mere narration of events, as a puerile business on a par with the writing of fairy tales, and devotes himself to collecting vast multitudes of facts, from which he can decoct the *psyche*. We picture Professor Lamprecht's library shelves as containing not books but phials—like those one sees at the apothecary's—labelled *Spirit. Teuton. VI. Saec.; Psyche Galliæ XVI. Saec.*, and so on. If he happens to wish to examine Richelieu or Mazarin, let us say, he needs only to uncork the bottle in which he keeps the *psyche* of seventeenth-century France, refresh his memory by taking a good smell of it, and then Mazarin or Richelieu becomes clear to him.

The first criticism that we make of the Lamprecht *dominant* under its various aliases is that it strikingly resembles the friend of our youth, the *Zeitgeist*, or Spirit of the Times, as our grandfathers, who were not yet versed in German, called it. Now the *Zeitgeist* is a most convenient and respectable abstraction, which, like the Normal Man or a composite photograph, sums up the features common to a large number of individuals. No one denies that times or epochs have their characteristic qualities, and differ from each other as the seasons do. But the true student of history will never forget that as every generalization ignores partial differences, so it can never be wholly true. A traveller on first landing in a foreign country thinks that all of its people are alike; but very soon he begins to distinguish individuals emerging from the mass, and, if he stays long enough, he sees only individuals. So the historian may approach a bygone epoch with the idea that it had only a single dominant; as he extends his acquaintance, however, he will discover in it five, six, ten, a dozen forms of activity, any one of which may plausibly be regarded as a dominant. To cite a single example: in the decade before the Civil War, which was the political dominant in the United States, Slavery or Union? In the course of time, Slavery and Secession formed one binary dominant and Emancipation and Union another; but historians are still disputing whether the abolition of slavery was merely an accompaniment of the preservation of the Union, or whether the Union was preserved because slavery was abolished. Professor Lamprecht's "psychic core" does not help at all, so far as we see, to decide such a question; for history should be a narrative and exposition of concrete human development, whereas the *Zeitgeist*, dominant, and their like, are abstractions.

One may well doubt, furthermore, whether it will ever be possible to collect, as Professor Lamprecht assumes to do, all the psychological ingredients of any age. The *Zeitgeist* can perhaps be reasonably well defined; but who can follow and measure all the undercurrents, the eddies, the backwater? Nations, like individuals, often lie fallow: often, too, important movements leave little documentary evidence. Is it so certain that a psychologist can gauge the passions and aspirations of preglacial man from a few rude pictures scratched on a reindeer's bone? Professor Lamphecht continually confounds technical skill in depicting or registering with "psychic" capacity. As if the Florentines of Dante's time, for instance, could be measured by the paintings of that time, or the genius of Bacon or of Franklin could be divined from their efforts in verse. Yet, if only the paintings of thirteenth-century Florence had survived, and if nothing remained of Bacon or of Franklin except their verse, Professor Lamprecht would proceed to reconstruct either the epoch or the men without so much as suspecting that his data were unrepresentative. In short, we cannot believe that a method which would fail if applied to even a small community or individual, to-day, can be infallible when applied to entire nations and epochs which have left behind them only scanty, or sporadic, or unrevealing memorials. To put the theory to the test, let any one attempt to define the "psychic core" of Greater New York for a single day.

Another difficulty with Professor Lamprecht's method, from the historian's standpoint, is its elusiveness. He seems perpetually to assume causes to fit his effects. It is so easy, apparently, for the psychologist to accept any problem as solved when he can say, "These phenomena are, of course, merely reactions to new stimuli." But your historian is not nearly so confiding a creature. Tell him that Napoleon III. simply reacted to a new stimulus when he unexpectedly stopped the Italian war after the battle of Solferino, and he will suspect you are mocking him. But let Dr. Lamprecht speak for himself. Here is a characteristic passage, in which he "explains" the development of Germany between 1870 and 1890:

"The first effect of the revolution is a complete dissociation of the former socio-psychic conditions. The social changes with the resulting increase of city activity, with its nervous haste and anxiety, its unscrupulous abuse of individual energy, progress of the technical arts, and the extraordinary multiplication of the means of communication throughout the world, the rapid development of all the sciences which deal directly with man, followed this enlargement of life: all these and a thousand other moments of *modern development* produced a great number of new stimuli, which neither the individual nor the community could escape; for they formed in their totality, so to speak, a new historical atmosphere. But the individual as well as the soul of the people as a whole, being continually surrounded, besieged, and permeated by a flood of new impressions, soon lost the former self-mastery and weakly yielded to the new stimuli. This went on, in the beginning, under a strong repulsion of the higher moments of will; energy was absorbed in a high degree by the acceptation and augmentation of the new stimuli, and was thus limited to an energetic volition in economic life, and to a marked receptiveness in the domains of the higher intellectual culture. Moral standards and intellect were taxed to the utmost; they were subjected to the perpetual assault of the new stimuli. This is the cause of the general nervous excitement which now began and which often came to light in pathological investigations—it was now that neurasthenia was discovered as a special form of disease—and which has not abated until to-day, but rather entered into the very psychic nature of the present and has become a constituent of the excitability or mental attitude of the age" (pp. 98-100).

Now we ask, does any one find in these vague assertions, stated in terms of psychology, an equivalent for an historical account of the development of Germany between 1870 and 1890? If you saw that paragraph by itself, should you inevitably recognize what nation and epoch it refers to? We need hardly point out how Professor Lamprecht continually confuses causes and effects—stimuli and reaction—and so dresses up a description to serve his purpose. Dealing as he does with abstractions, he apparently fails to see that his chief factor—"modern development"—is unaccounted for. In reality, it is merely the sum of the various symptoms in individuals and in the community; yet he refers to it as if it were some external force which caused those manifestations in the German people. This is as absurd as to confound the violin with the violinist. Such mental confusion is the penalty men pay for losing their grip on the concrete. The most familiar example of this form of mental degeneracy to-day is the abstract State which the German Socialists have conjured up—the State which is perfect, in spite its being composed of very imperfect units.

Professor Lamprecht's method may be good psychology, it certainly is not history. Whatever help the historian can get from psychology—and we are inclined to believe that it may be considerable—he must remember that the two fields are absolutely distinct. If he allows himself to psychologize history, he will fall into the slough of abstractions whither Professor Lamprecht has preceded him—that oozy, impassable slough where *Tendenz* historians and literary critics and doctrinaires of all sorts flounder until they sink. History may properly be regarded as having a share in philosophy, economics, geography, religion, art, literature, ethics, sociology, psychology, and other human sciences, but it is independent of them, and it should refuse to be dominated by psychology as much as by pathology or any of the rest.

For history is, above all, human and concrete; and it can no more be expressed by abstract formulas than Shakspere's sonnets can be expressed by algebraic signs. What shall we think, then, of Professor Lamprecht, who says of the ways in which civilization is transmitted from age to age

and from people to people, "We shall be able, when using the picture of a well-known psychic process, to speak with reference to these processes of osmotic phenomena of diosmosis, endosmosis, and exosmosis" (pp. 196-7)? Shall we not conclude that we are dealing not with an historian but with a psychologist—one who by temperament construes all events and human deeds abstractly, in terms of psychology? We leave specialists in that science to make what they can of his osmotic phenomena, fully persuaded ourselves that diosmosis has no more than capillary attraction or deglutition to do with history.

Yet we cannot but be grateful to Professor Lamprecht for stating the argument for psychology so absolutely, because nothing clears the air more quickly than extreme statements. No doubt, as we said above, historians can derive helpful suggestions from a knowledge of psychological results: Professor Lamprecht will teach them what to expect from the most thoroughgoing pursuit of psychology, and his book will serve them as a warning what to avoid. We only regret that his awkwardness in thought and expression will retard the rapid diffusion of his doctrines: for the sooner these are generally understood, the sooner will historical writers realize that their strength lies in loyalty to their own subject, and cease to surrender their birthright to an alien science.

THE ARGIVE HERÆUM.

The Argive Heræum. By Charles Waldstein, with the coöperation of George Henry Chase, Herbert Fletcher De Cou, Theodore Woolsey Heermance, Joseph Clark Hoppin, Albert Morton Lythgoe, Richard Norton, Rufus Byam Richardson, Edward Lippincott Tilton, Henry Stephens Washington, and James Rignall Wheeler. In two volumes. Volume ii. Terra-cotta Figurines, Terra-cotta Reliefs, Vases and Vase Fragments, Bronzes, Engraved Stones, Gems, and Ivories, Coins, Egyptian or Græco-Egyptian Objects. Boston: Houghton, Mifflin & Co. 1905. Pp. xxix., 389, 103 pls., 216 figs. 4to.

It is about two years and a half since the first volume of this work was noticed in these columns. The delay in the appearance of the second volume is more or less generally known to be due to the fact that the preparation of the section on Bronzes, by Mr. De Cou, took some years longer than was at first expected. This section is, therefore, naturally the first to which one turns. In bulk (pp. 149, with 58 plates) it is certainly one of the most important parts of the book, and it is evident that the careful cleansing and measuring of the 2,841 objects described must have been a long and toilsome task, which Mr. De Cou has performed most conscientiously. The objects themselves are, however, not beautiful, nor especially interesting, and it seems to us that a somewhat more summary treatment might have been as satisfactory as the detailed catalogue here presented. The circumstances of discovery at the Heræum afforded little or no indication of date, except that practically all the bronzes, and most of the other small objects, were earlier than the destruction of the old temple, in 423 B. C.; and for this reason as well as for the sake of clearness, Mr. De Cou has classified the bronzes first by subjects, as statuettes, pins, nails, etc., and second, by style. This is reasonable, and his classification may serve as a model for future catalogues of similar objects. The material for study is presented much as it might be in the cases of a museum. To be sure, both text and plates are encumbered with duplicates, which might as well have been omitted, but that is a small matter. The real fault of this section is a complete lack of perspective. The bronzes are set before us as if they were in themselves important objects, whereas their only importance lies in their relation to other things. In his prefatory note, Professor Waldstein says that "there is hardly an archæologist living who has had more experience in dealing with ancient bronzes" than Mr. De Cou. This may be the case; but if Mr. De Cou's experience has brought him any broader knowledge than that required for the description of the objects immediately before him, he conceals it most successfully. This is especially unfortunate in a book like this, which ought to appeal, not only to specialists, but also to the general cultivated public. The entire volume consists, for the most part, of descriptions of small objects, but Mr. De Cou is the only contributor who has been unable, or unwilling, to add some touch of life to the bare bones of his catalogue. The appendix, containing the inscriptions on bronze, is careful and scholarly.

In his prefatory note, Professor Waldstein, while regretting the delay in the appearance of the volume, which has made some chapters seem, in part, a little out of date, suggests that the independent publication of the discoveries at the Heræum, without the discussion of more recent discoveries in Crete and elsewhere, may have a peculiar value of its own. In this we can hardly agree with him, and we are glad that he has found a place in his "note" for some discussion of recent investigations. He maintains that at the Heræum a local development in pottery and its decoration can be traced from neolithic times to the Mycenæan period, and that the Mycenæan style arose in the Argolid. It is therefore impossible for him to accept Mr. Duncan MacKenzie's theory that the Mycenæan style was developed in Crete from the Kamares style through that called Early Minoan. On the contrary, he suggests that the Cretan monochrome Mycenæan style was brought about by the introduction of pure Mycenæan work from elsewhere. This would account for the differences between Cretan Mycenæan decoration and the Mycenæan decoration in use on the continent. It is as yet perhaps too early to be dogmatic in these matters. There was evidently much intercourse between the inhabitants of the different coasts of the Ægean in early times, and the Mycenæan civilization doubtless owes its development, even if not its origin, to a variety of reciprocal influences. Professor Waldstein further suggests that the Mycenæan style of sculpture persisted in Crete down to the time when Cretan sculptors, such as Dipoinos and Skyllis, influenced the beginnings of archaic Greek art, and that some parts of the palace at Cnossus, including the paintings and stucco decorations, belong to this comparatively late period. The suggestion is interesting, involving, as it does, a redating of much of what has recently been found in Crete, but will remain a mere suggestion until supported by more complete evidence than is here produced.

Of the Terra-cotta Figures discussed by Professor Waldstein and Dr. Chase, over 85 per cent. are specimens of the flat-bodied type, with either the "bird-face" or the archaic head, which is its successor. It is the preponderance of this type which justifies the name "Argive." Since some of these rude figures, evidently not among the earlier specimens, were found in a tomb which contained nothing later than Mycenæan times, it is clear that the origin of the type does not belong to the period after the "Dorian Invasion," and the circumstances make it probable that the "Argive" type came into being before the rise of the Mycenæan civilization. The figures of this type represent a female figure, probably a primitive nature-goddess. There are among the terra-cottas from the Heræum none of the charming little statuettes such as have made Tanagra and Myrina famous. Professor Waldstein and Professor Hoppin publish also ten terra-cotta plaques with reliefs, all archaic ex-votos.

Perhaps the most interesting part of the book is the section on Vases and Vase Fragments, by Professor Hoppin. About 250,000 fragments, belonging to some 50,000 vases, were found. Of this vast number, Professor Hoppin has selected comparatively few representative pieces for publication. Unfortunately, few vases were found entire, and not many could be reconstructed from the fragments, nor are any of these remarkable for their beauty. Of Attic vases of the best period but few fragments were found, no doubt on account of the embargo mentioned by Herodotus (v. 88). By far the greatest number of fragments belong to pre-Hellenic times, if we except a class of rather coarse local pottery, which seems to have been produced for a long period. Geometric vases are numerous. Professor Hoppin proposes a new classification of Mycenæan vases, which differs from that of Furtwängler and Loeschcke by ascribing to the second class a large part of what they put under class iii. By the new classification the naturalistic or pictorial decoration falls under classes i. and ii., the conventional style under classes iii. and iv. The subdivisions of classes ii. and iii. are less important. In the discussion of the vases generally called proto-Corinthian, Professor Hoppin shows that their peculiar style of decoration probably originated in the Argolid, a theory which has already been accepted by other authorities, and he therefore designates them as "Argive" vases. He differs, however, from Professor Waldstein in so far as he regards the "Argive" style as something practically new, a development from the Mycenæan style, while Professor Waldstein considers it rather a development of the linear principle which shows itself persistently in the Argolid from the earliest times. To us Professor Hoppin's view seems, on the whole, preferable. The division into "Early Argive," a series of small vases with linear ornament, "Linear Argive," vases with linear decoration showing the influence of the "geometric" style, and "Oriental Argive," is clear and satisfactory. The old term, "Proto-Corin-

thian," however, implying nothing more than that this style is a logical precursor of the Corinthian style, has certain advantages over the term "Argive," especially if the Mycenæan style should prove, after all, to have originated in the Argolid. Professor Hoppin finds it impossible to explain the growth of the "geometric" style without foreign influence, at least at the Heræum, whatever may have been the case in Attica. Some of the local, or unclassified, ware published in the colored plates is interesting as offering examples of individual or local vagaries; and the fragmentary Attic polychrome cylix ascribed to the school of Euphronios is very attractive. The Inscriptions on Vases, carefully published by Dr. Heermance, are unfortunately of little interest.

Among the Engraved Stones, Gems, and Ivories, discussed by Prof. Richard Norton, is a series of steatite stones, all rudely carved and pierced, which are interesting chiefly because they seem to be a strictly local product. The Coins found at the Heræum were few—only 155—and of these only about one-fiftieth belong to the times of free Greece. The latest are of Venetian times. A series of minute bronze pieces, some of which bear an alpha with broken cross-bar, may, perhaps, as Mr. De Cou, who publishes the Coins, suggests, indicate that, after the suppression of the Achæan League, a local coinage was permitted to Argos. The Egyptian and Græco-Egyptian Objects found are few, and offer nothing new. They are published and discussed by Mr. Lythgoe. All seem to belong to Naucratis, with the exception of two glass scaraboids, which show Phœnician influence. These belong, however, to the same date as the rest—the twenty-sixth dynasty and later.

We have noticed a few misprints, but none of importance, except the following, which are somewhat irritating: Pages 145, 147, and 148 (*bis*), the references to Plate LXIV. should be to Plate LXVI.; page 150, for LXV., read LXIV.; pages 153 and 154, for LXVI., read LXV.; page 158, for LXV., read LXIV.; and page 165, for LXVI., read LXV. This volume may not be as interesting to the general reader as was its predecessor, but it contains much valuable material, well arranged and presented. Those responsible for the publication may congratulate themselves upon having published in a dignified and adequate manner the important results of the work at the Argive Heræum.

Edward FitzGerald. By Arthur C. Benson. (English Men of Letters.) The Macmillan Co. 1905.

Mr. Benson's brief biography follows close on the heels of Mr. Thomas Wright's exhaustive 'Life,' into which was gathered every impression, every anecdote, of Edward FitzGerald that his distinguished friends had recorded or the old people of Woodbridge could recollect or invent. The biographer of a man whose life is wholly without action has no easy task. He is like a dramatist bidden to compose a drama in which there will be no entanglement, and therefore no solution, no crisis, and no dénouement. So it is that FitzGerald's biographers must fall back on minutiæ and psychology. If he had only had one serious illness, one real love affair—we do not think any one has proved a hopeless passion for Miss Crabbe—in short, a crisis of any sort to mark a reversal, so that one could say that after this he was an altered man, or that was in his palmier days! FitzGerald had no palmy days, no poignant experience to change the scheme of his life. His marriage does not count; it affected him like a bad fit of indigestion. It is curious to observe how, as one reads this 'Life,' one feels again, as in reading the longer work of Wright, that nothing ever checked the sluggish current of FitzGerald's provincial existence; insensibly he passed from youth to middle age, having no fire of spring to die down in his life, no "sweet-scented manuscript" of youth to close, no harvest of wild oats to reap, being and doing at twenty what he was to be and do at forty, and fifty, and sixty, and till the end.

We may be quite sure that we know the worst of FitzGerald. He spent his life in a little English country town, where a man cannot take his boots to be mended (in English country towns one does) or change his lodgings without the event passing into the local saga. Some day we intend to look into the Woodbridge saga; we expect to find that there were in the generation of FitzGerald, or before, or after, other eccentric gentlemen such as abound in English country towns, on whom if one took to inquiring one could fasten half the characteristics that have been raked up in Woodbridge by "Fitz's" industrious biographers. Old gentlemen of his type are so much alike in that setting; why should he have to shoulder all the peculiarities that make up the Woodbridge type? Such as it is, however, the man's portrait is painted, and provincial candor and the provincial long memory for trifles have done their worst. It remains for his biographers to explain and account for the charm that made him so dear to Thackeray and Tennyson and the rest, and for what, in every case where it happens, seems so mysterious, the flowering of all a man's talents into a single great literary achievement—in this case the paraphrase of Omar.

FitzGerald was not the man to make what is called a "good" translation. He could say very effective things about the Greek tragedians, but that did not prevent him from wanting to rewrite their plays. He left Creon out of the two scenes in the "Œdipus Tyrannus" because he did not think his presence essential to the situation, and he added florid ornament to the language of Æschylus. Browning, when he translates the "Agamemnon," or the "Alcestis," or the "Mad Heracles," too often allows himself to seem incoherent and uncouth in his effort to be literal, but we have at least an agreeable security that if we turn to the Greek text for the meaning we shall find there the idea that the translator is trying to express. With FitzGerald we have no such assurance. We suppose this indefiniteness of activity, so exact a reflection of his life, may account for the fact that a recent essayist, desiring to attach a superlative to FitzGerald, called him "the most refined letter-writer of England in a century"—certainly not an exhaustive or too flattering definition.

Mr. Benson's book will be found to contain all that any reader needs to know about FitzGerald, and it is an excellent cheap substitute for those who cannot afford Mr. Wright's massive illustrated volumes. In the matter of form it is no improvement on the larger work. No one was more sensitive than FitzGerald to English style, and so far his biographers have written in a careless, slipshod manner that he would have found very offensive. Mr. Benson, like Mr. Wright, has simply flung his English sentences together. One paragraph will serve to illustrate what we mean:

"However indulgently one may try to judge FitzGerald's versions of Calderon, they cannot be reckoned among his literary successes. It is probable that FitzGerald did not really understand Calderon, and it is not unfair to say that we have here a marked instance of FitzGerald's friendships biassing his studies. It was, no doubt, the influence of Cowell that turned his mind definitely to Calderon. It is probable that Cowell did not introduce FitzGerald to Calderon, though he undoubtedly blew the smouldering ashes to a flame. Archbishop Trench was a translator of Calderon, and Tennyson mentions Calderon in a suppressed stanza of the 'Palace of Art'; so that it is probable that Calderon was not unknown in FitzGerald's Cambridge circle" (p. 124).

This is the style of notes in a literary notebook, all ready to be worked up into periods. Mr. Benson gives us again all the well-known anecdotes, and, like Mr. Wright, falls back on the regular resource of FitzGerald's biographers, who, having little to say, repeat that little more than once. We cannot take leave of the subject without a final regret that a writer so intelligent as Mr. Benson did not think it beneath his dignity to record the trivial and sordid gossip of Woodbridge, much of it unkind, and none of it to be trusted, if we know anything of English provincial manners and the powers of observation of the inhabitants. FitzGerald paid dearly for his so-called seclusion. If he had lived in the real solitude of London streets and crowds, who would have thought it either essential to a knowledge of his personality or worthy of a historian of literature to record that on occasion he could snub an officious intruder (pp. 173-174), or express a passing disgust of self-indulgence (p. 176), or in a moment of irritation reject help in his growing blindness (p. 175), or, in such a silly season as may befall any one of us, utter sentiments that sound mawkish (p. 50), or yearn for affection without knowing quite how to win or retain it (p. 196 and *passim*)? These are the minor weaknesses common to most men and women. And as for famous men, what a record of irritation and hypersensitiveness might have been raked together for Tennyson from the memories of observing neighbors of Farringford and Aldworth! Where FitzGerald was misguided was in placing himself, a proud, sensitive, self-willed, indolent, capricious being, in the pitiless glare of provincial life. He added to this the fatal mistake of giving his biographer no incidents to record. One must still feel that the real life of the translator of Omar is told in his admirable letters, and that his ideal biographer, if we must have one at all, will give us more letters and no foolish anecdotes.

Richard Wagner to Mathilde Wesendonck. Translated by W. A. Ellis. Scribners. 1905.

For Wagner's admirers his personality apparently has quite as great an interest as his art. About a year ago his letters to Frau Wesendonck were printed in Germany,

and already the publishers are announcing the twentieth thousand—a probably unprecedented event in the records of musical literature. The reason is not far to seek. In these letters Wagner reveals his inmost thoughts and aspirations even more intimately than in his correspondence with Liszt; preëminently sympathetic as Liszt was, he could not quite take the place of a woman confidant in the case of a man like Wagner. The wife of Otto Wesendonck seems to have had a genius for sympathy, and it is a great pity that only a very few of her letters to Wagner have been preserved to be printed in this volume. What became of the others is not known; Mr. Ellis comes to the conclusion that Wagner's (first) wife destroyed the whole bundle in a fit of jealousy, being unable to understand a friendship such as existed between him and his generous patron's wife—a friendship concerning which Wagner wrote to his sister that "the very highness and unselfishness of such relations as subsisted between us made them forever impossible of explanation to a nature like my wife's"; while Frau Wesendonck herself wrote, in her quaint English in a letter dated 1892 (of which Mr. Ellis prints a facsimile): "The tie that bound him to Mathilde Wesendonck, whom he then called his 'Muse,' was of so high, pure, noble, and ideal Nature that, alas, it will only be valued of those, that in their own Noble chest find the same elevation and selfishlessness of Mind."

As Wagner's letters, with all their terms of endearment, bear witness on every page to the truth of these statements, it was hardly necessary for Mr. Ellis to write a sixty-two-page introduction to prove that Wagner did not treat his wife unkindly, but that he really was a martyr, tied to a woman far below him mentally, unable either to understand or to love him; a woman addicted for a long time to the use of crude laudanum, which occasionally must have made her behave "like a she-devil in the house." One cannot but agree with Mr. Ellis, however, that when Minna left her husband, after they had been married half a year, and he appealed for a divorce, it was a great pity he withdrew the suit and welcomed back the penitent. Never was there a more ill-mated couple, and it is not surprising that Wagner, when he found in Frau Wesendonck the kind of woman he ought to have married, was prompted by his always extravagant and uncurbed feelings to actions which his wife and the Zurich gossips may be pardoned for having misinterpreted. The tragic situation is immortalized in the greatest of all operas, "Tristan and Isolde," and this is one of the main reasons why these letters, written in the same volcanic style as that opera, have made such a deep and immediate appeal to the musical world.

As the contents of the present volume were reviewed at length in these columns last September, it is not necessary to dwell on them again. The peculiarities of Wagner's style are to a considerable extent reflected in the English version. The loquacious translator, not content with his long Introduction, also favors the reader with a "Valedictory," in which he discusses the spelling of the Wesendonck name, expresses the opinion that had Frau Wesendonck lived longer she would herself have written an Introduction to this volume; and explains that Wagner's wish that these letters should be destroyed has been carried out in part—"the originals no longer exist." Mr. Ellis has also rearranged the Zurich letters in the light of internal evidence. From every point of view, including that of the printer and binder, 'Richard Wagner to Mathilde Wesendonck' is a most attractive volume. The illustrations of the German edition have been retained, and in addition there are facsimiles of themes for "Parzival" and "Die Meistersinger" (Sachs's Cobbler Song) and of the concert-close for the "Tristan" prelude dated Paris, December 15, 1859.

Bygones Worth Remembering. By George Jacob Holyoake. E. P. Dutton & Co. 1905. 2 vols., 295, 301 pages, with index and portraits.

It were unfortunate for the world if a proportion of brave and clear-sighted spirits did not feel it laid upon them, as did Winkelried, to press forward, at all cost, gathering the spears of opposition and contumely into their own bosoms, and making the way easy and open for humanity at large. Mr. Holyoake is, as was Mr. Bradlaugh, a man of this stamp. He has fought his way for himself and others, and now, in his eighty-eighth year, finds himself respected by all whose opinion is worth having. In 'Bygones Worth Remembering,' he gives us two delightful volumes, brim-full of interesting reminiscences of well-known men and women, replete with wisdom and kindly feeling. He states many facts, he corrects many fallacies, that should claim the consideration of historians of British politics during the nineteenth century. Seldom have we read a book breathing a more tender, tolerant, and judicial spirit. He thus prefaces his chapters on individual character:

"It is probably vanity—though I disguise it under the name of pride—that induces me to insert here certain incidents. Nevertheless, pride is the major motive. When I have been near unto death, and have asked myself what has been the consolation of this life, I have found it in cherished memories of illustrious persons of thought and action, whose friendship I have shared."

And he places in the forefront of these Harriet Martineau and William Lloyd Garrison.

The history of the gradual change in his opinions, from those of a youthful Sunday School teacher and evangelical preacher to those held in mature life, is deeply interesting. Under all mutations of belief, he never lost his tenderness of feeling for the convictions of others.

"We should 'go on loving men, but not expecting too much of them.' . . . Whatever my convictions, I was always the same to my mother. The wish to change her views never entered my mind. She had chosen her own. I respected her choice, and she respected mine. In after years, when I visited Birmingham, I would read the Bible to her. She liked to hear my voice again as she had heard it in earlier days. When her eyes became dim by time, I would send her large-type editions of the New Testament, and of religious works which dwelt upon the human tenderness of Christ. . . . The piety of parents should be sacred in the eyes of children. Convictions are the food of the soul, which perishes on any other diet than that which can be assimilated by the conscience."

This side of Mr. Holyoake's character is not at all the one by which the world has generally known him.

There are suggestive chapters on "The Peril of Scruples," "Taking Sides," "Mistrust of Moderation," "New Convictions Which Came Unsought," "Difficulty of Knowing Men"; but the most interesting sections are those in which Mr. Holyoake gives reminiscences and discusses the characters of eminent persons with whom he was brought closely in contact—Lewes, George Eliot, Cobden, Miss Martineau, Mazzini, Garibaldi, Mill, Gladstone, Herbert Spencer. We are introduced to a third brother Newman, of whom few may have before heard. Of all, Mr. Holyoake has something fresh to say. For example:

"Some women, not distinguished for personal beauty when young, become handsome and queenly later in life. It was so with Harriet Martineau. George Eliot did not come up to Herbert Spencer's conception of personal charm. One day, when she was living at Godstone, she drove to the station to meet Mr. Lewes. He and I were travelling together at that time, and he caused the train to be delayed a few minutes that I might run down into the valley to meet his wife. I had not seen George Eliot for some years, and was astonished at the stately grace she had acquired."

Our author has unbounded admiration for Mazzini and Garibaldi, and was secretary and principal mover in enlisting and dispatching an English contingent to the help of the latter in his Sicilian campaign. He accepts the judgment of a contemporary speaking of Mill's power in debate: "He passed over his adversary like a ploughshare over a mouse." The events of late years led him to acknowledge the reasonableness of Mill's misgivings in respect of the operation of the ballot and the wide extension of the franchise. He calls to mind a passage in 'Felix Holt': "Ignorant power comes in the end to the same thing as wicked power," and adds: "But there is this difference in its nature: 'Ignorant power' can be instructed, and experience may teach it; but 'wicked power' has an evil purpose, intelligently fixed and implacably determined."

We are treated to a parallel between Voltaire and Gladstone, greatly to the credit of both, but too long to quote. But we take over this regarding George Eliot:

"She held as a solemn conviction—the result of a lifetime of observation—that in proportion as the thoughts of men and women are removed from the earth on which they live, are diverted from their own mutual relations and responsibilities, of which they alone know anything, to an invisible world which can alone be appreciated by belief, they are led to neglect their duty to each other, to squander their strength in vain speculations which can result in no profit to themselves or their fellow-creatures, which diminish their capacity for strenuous and worthy action during a span of life, brief, indeed, but whose consequences will extend to remote posterity."

Many will differ from some of our author's opinions and estimates. "A fraud in war is only a little less base than a fraud in business." Stratagem and fraud are of the very essence of war. "To this day the House of Lords is an alien power in England." Its power appears more firmly enthroned than ever, through the will of a democratic England which could at any time end or mend it. Mr. Holyoake says that Cobden "introduced more immorality into politics than any other public man in my time, . . . by advising electors to vote for any candidate, irrespective of his

politics, who would vote for the repeal of the Corn Laws." Neither Mr. Cobden nor Mr. Bright, who is coupled with him in the same regard in another passage, is so specially guilty. Such opinions are shared, such advice is given, by all who believe the reform they desire is at the basis of social order. It may be true that "the affair of the Phœnix Park showed that the English nation did not go mad in the face of desperate outrage." They did worse: for the crime of half a dozen men they condemned all Ireland to permanent political disabilities, as they never would have condemned their own country. The pious who have regarded Mr. Holyoake's opinions with horror, will find it difficult to reconcile the occurrences related in the chapter entitled "Adventures in the Streets" with any theory of special providences. He narrates sixteen narrow escapes from mutilation or death. "I have no theory of my many exemptions from fatal consequences. All I can say is that, had I been a saint, I could not have been more fortunate."

The last chapter, in which is summed up all that has been gained for humanity of late years, is a forcible indictment of "good old times" theories. The nineteen portraits scattered through these volumes add to their interest, but are of unequal merit.

The Jordan Valley and Petra. By William Libbey, Sc.D., and Franklin E. Hoskins, D.D. G. P. Putnam's Sons. 1905. Two volumes, pp. xv., 353, viii., 380.

This work is beautifully illustrated with more than 150 half-tone reproductions of photographs taken by the travellers, over fifty of which are photographs from Petra. When we have said this, we have said the best there is to be said. Dr. Libbey, professor of physical geography at Princeton University, made a compact twenty years ago with one of his then pupils to visit Petra and the region east and south of the Dead Sea. During these twenty years that pupil, Dr. Hoskins, has been a missionary in Syria. The experience there acquired enabled him to make very efficient provision for the proposed journey, which was at last undertaken in the spring of 1902. In the introductory chapter we are told that Professor Libbey's purpose in this journey "was to study the valley of the Jordan, from beginning to end." In point of fact the travellers did follow the Jordan fairly closely from Banias to the lower end of the Sea of Galilee. The rest of their route lay on the eastern side of the Jordan, as far away from that stream as are Nablus and Jerusalem on the western side; and indeed the Jordan might as well be studied by a trip from Nazareth over Nablus to Jerusalem as by the route which the travellers followed.

The first volume is occupied by very minute descriptions of the composition of the caravan, the method in which one should deal with the natives, etc., with an itinerary of the journey, and statements as to the history of the places visited, including occasional pious remarks about their Bible character. There is absolutely nothing, until Madeba is reached, toward the end of the first volume, which is new or of any interest to any one except the travellers, aside from the photographs, some of which are new views and worth possessing. It is, however, with Madeba that the photographs become particularly interesting and valuable, because available pictures of the section from Madeba southward are so scarce. We find here fresh information regarding present conditions at Madeba and Kerak, and there are some admirable descriptions of the contour of the country and of the great gorges which descend from the plateau of Moab to the Dead Sea, especially the ancient valley of the Arnon, of which the authors say that it "has no equal upon earth, except the Colorado cañon in the United States."

A little more than one-half of the second volume is devoted to a description of Petra, where the travellers remained for five days, camping in the very heart of the city. In spite of the opportunity which this comparatively long sojourn in Petra afforded, they cannot be said to have added to our information with regard to that site. With the exception of a couple of insignificant fragments of Nabathean funerary inscriptions and some interesting rock cuttings on the northwestern edge of the citadel rock, which they supposed to be a high place, they seem to have seen nothing new. The plan used is the old plan of Laborde and Linant, reduced in scale. Unfortunately, it is so reproduced as to fail entirely to give the idea that Petra occupies a great depression in the surface of the rock, with almost precipitous walls on all sides. Unless one were already pretty familiar with the site, one would be hopelessly bewildered in attempting to apply the plan to the descriptions of the text. We read of an east wall, of a north wall, etc., but there is no indication of anything of the sort on the plan. The same plan reproduced in Baedeker gives some idea of the character of the site. Considering the peculiarly favorable opportunity which the travellers had, the results as represented here are extremely disappointing. The only material approximating a scientific contribution to our knowledge is contained in a statement of Dr. Libbey's theory of the formation of the Jordan rift, covering less than two pages (259-260), and an appendix by Mr. Van Ingen with a few plates of the fossils and rocks brought back by Dr. Libbey. On the return journey from Petra the party crossed the ghor just to the south of the Dead Sea, thence proceeding to Jerusalem on the west side of the Jordan. The whole trip from Beirut to Jerusalem here described occupied forty-one days.

Constantine the Great. By John B. Firth. G. P. Putnam's Sons. 1905. [The Heroes of the Nations Series.]

In this learned and thoughtful book Mr. Firth has touched upon nearly all the questions which render the character of Constantine a puzzle and his reign an era of perpetual fascination. If the modern writer wishes to save himself trouble, he will take strong ground either for or against the Emperor, because in both cases a fine show of evidence can be mustered from the fourth century to support the position adopted. But when Lactantius comes to be compared with Zosimus and Eusebius with Julian, difficulties emerge which can properly be faced only in a mood of painstaking enquiry and candid hesitation. Mr. Firth places a good deal of reliance upon Eutropius wherever he can be used, but the brevity of this author is such that he cannot be taken as a satisfactory guide in most matters of detail. Few writers attempt nowadays to exculpate Constantine from the charge of having put to death, in a mood of anger or suspicion, his son Crispus and his wife Fausta. Such crimes belong in a different class from the ordinary assassinations that accompanied the rise of a Roman general to imperial power—assassinations, in the present case, like those of Maximian, Licinius, Licinianus and Cæsar Bassus. Whatever meaning they may have, they point to the existence in Constantine of sharply conflicting instincts. At times he is a savage, but most of his acts point to an appreciation of higher standards than were grasped by most Romans of the later Empire.

Mr. Firth finds in a phrase of Eutropius a hint of the fact which accounts for many of the contradictions and inconsistencies in the Emperor's career. *Aliquantum mutavit*—that is to say, as he grew older he changed somewhat and changed for the worse. That the epitomist is not hostile in his general tone may be gathered from such a passage as this:

"At the opening of his reign, Constantine was a man who challenged comparison with the best of princes; at its close he deserved comparison with those of average merit and demerit. Both mentally and physically his good points were beyond computation and conspicuous to all. . . . He was devoted to the arts of peace and to the humanities, and he sought to win from all men their sincere affection by his generosity and his tractability, never losing an opportunity of enriching his friends and adding to their dignity."

Aurelius Victor bears testimony to the same process when he contrasts the irreproachable character of Constantine's rule during the first ten years of his reign with the reckless extravagance that marked its close. From Eusebius, of course, nothing but adulation can be expected, but Zosimus and Julian unite in stigmatizing the love of adulation and self-indulgence, which finally overcame the active and clear-sighted hero of the battle at the Milvian Bridge.

The practical effect of accepting this view of Constantine's development is that one is forced thereby to give up a popular theory. The first of the Christian emperors ceases to be a mere political schemer and a convert because conversion helped him to win a throne. On the other hand, Constantine stands out as one who had a genuine interest in Christianity, but was unable to resist the temptations which were placed in his way by the exercise of absolute power. The last twelve years of the reign present a strange medley of contradictions. In 325 the Emperor is at Nicæa, presiding at the first general council with all the dignity and decency imaginable. In 326 he is at Rome giving orders for the execution of Crispus, and shortly afterwards for that of Fausta. Between 326 and 330 he is building Constantinople with all the clear-sightedness of a great statesman; and yet with such haste and neglect of architectural precaution that large parts of the town fall an easy prey to earthquakes. From 330 to 335, he is occupying a singular position between Arians and Catholics—meaning to be a Christian, but not holding a clear course with reference to the great dogmatic issue, and postponing the date of his baptism as long as possible, perhaps in hope that his chance of heaven would be brighter if his life after baptism were im-

maculate. In 335 he divides the Empire among his children, without any such reference to the public welfare as had actuated Diocletian when he established the prætorian prefectures, but rather in the spirit of a father dividing a private patrimony among his sons. This act is, in the opinion of Mr. Firth, the most marked proof of his degeneracy which can be cited. "Such a partition meant the stultification of his political career, for he thus destroyed at a blow the political unity which he had so laboriously restored out of the wreck of the system of Diocletian."

Professor Bury has said that "the evidence seems to show that Constantine's religion was a syncretistic monotheism; that he was content to see the deity in the sun, in Mithras, or in the God of the Hebrews." From this view Mr. Firth differs entirely, in so far as it applies to Constantine's attitude towards religion after the overthrow of Maxentius. Two facts are usually taken to disprove the sincerity of Constantine's adherence to the Christian faith. These are the atrocities he committed after he had openly declared himself a Christian, and his unwillingness to use the full leverage of his imperial position against paganism. But Mr. Firth, who would be the last to extenuate Constantine's misdemeanors, ranks him among convinced, though not among devout, Christians. A proneness to superstition he admits, along with a gross materialism of religious conception, such as saw the confirmation of Christianity in his own triumph. But, says Mr. Firth,

"had he been indifferent to religion, or indifferent to Christianity, had he even been anxious only to hold the balance between the rival creeds, he would never have surrounded himself with episcopal advisers; never have set his hand to such edicts as those we have quoted; never have abolished the use of the cross for the execution of criminals, or have forbidden Jews to own Christian slaves; never have called the whole world time and again to witness his zeal for Christ; never have lavished the resources of the Empire upon the building of sumptuous churches; never have listened with such extraordinary forbearance to the wranglings of the Donatists and the subtleties of Arians and Athanasians; never have summoned or presided at the Council of Nicæa; and certainly never have made the welfare of non-Roman Christians the subject of entreaty with the King of Persia."

Though written as a volume for a popular series, this book should not escape the attention of scholars, since it is based upon a first-hand study of the authorities, and is the fruit of independent reflection.

Giotto. By Basil de Selincourt. (Library of Art.) London: Duckworth; New York: Scribners. 1905.

In the face of what has already appeared, especially of recent years, in the way of serious and authoritative criticism on the same subject, M. de Selincourt has evidently not been lacking in either courage or self-confidence in taking upon himself the task of again discussing, in a book of something over 200 pages, the personality and genius of the great Florentine master. Although evidently written *con amore*, and with a sincere but at the same time laudably temperate enthusiasm and appreciation, it is hardly distinguished by any exceptional novelty or originality of thought, and the author can be said to have added little, if anything, to the now generally accepted estimate of Giotto and his work. There is even less to justify the somewhat aggressive tone which he allows himself to adopt at times, in regard to certain other critics of the so-called "modern" school. We sympathize to no small extent with M. de Selincourt's attitude in these respects, but his championship of tradition is not always supported by the soundest of defences.

As was to be expected, the author follows, in the main, the older and more traditional list and chronological arrangement of Giotto's works. He looks upon the frescoes from the life of St. Francis in the Upper Church at Assisi as the earliest manifestation of the master's art, although he seems himself in doubt as to the authenticity of the last nine subjects, so obviously the work of another hand. He then passes to the Allegories in the Lower Church, as being next in date, refusing to accept the fine series in the right transept. The very early "Stefaneschi" altar-piece at Rome he considers subsequent in execution to the Allegories. He denies Giotto's participation in the strong works in the Chapel of the Magdalene at Assisi, using again, as one of his arguments, the lack of traditional confirmation of it. He summarily dismisses from the list of Giotto's works—"at least in their present state"—and to our mind rightly, though he gives no reasons, the damaged frescoes in the Florentine Bargello; casts a possible doubt upon the altar-piece in the Louvre; makes no mention of the fine little "Presentation" belonging to Mrs. Gardner in Boston, and passes over, with equal silence, the exceedingly Giottoesque frescoes in the Refectory of S. Antonio at Padua.

As is usual, the greater part of the book is, of necessity, given up to the frescoes of the Paduan Arena and the Bardi and Peruzzi chapels in Santa Croce, at Florence. In the author's comments on these works there is much that is both interesting and suggestive—much that bespeaks the intelligent and appreciative amateur, in fact, rather than the sterner and less emotional critic. Frankly speaking, it is precisely here that M. de Selincourt's book may lay claim to its saving merits; taken as a guide-book, it will serve its purpose perhaps as well as, if not better than, most of the volumes which have hitherto occupied themselves with an exposition of the master's works, and as such will form even a welcome addition to the descriptive literature of its kind. We should, perhaps, have dwelt less at length upon its defects were it not for its pretensions, and for the fact that M. de Selincourt falls under a graver imputation than that of any critical shortcoming—one which he shares with several other recent writers upon art, viz., the only too obvious and studied suppression of all allusion to preceding authorities to whom his pages show, in far more places than one, an evident indebtedness. We should not have alluded to this fact did it not touch upon a habit that is becoming too general among a certain class of writers to pass longer unnoticed.

Pictures in Umbria. By Katherine S. Macquoid. With fifty original illustrations by Thomas R. Macquoid, R.I. Charles Scribner's Sons. 1905. Pp. xvi+319.

The genesis of this book appears to be as follows: In the early eighties the authoress spent several weeks or months in Perugia, where she seems to have enjoyed a very pleasant and not unprofitable holiday, visiting all the principal objects of interest in the city itself, and making the usual excursions to Assisi, Spello, Foligno, and Lake Trasimeno. To a keen eye for the beauties of nature and an appreciative, if not very discriminating, interest in art, she added a knack of ingratiating herself with the common people, whose quaint sayings she carefully recorded. For nearly twenty years the information thus acquired lay fallow, and then, with the assistance of M. Paul Sabatier's 'Vie de Saint François,' the chronicle of Matarazzo, the 'Fioretti,' 'The Legend of the Three Companions,' and Miss Duff Gordon's 'Story of Assisi,' she compiled the work before us.

It would be easy to point out numerous inaccuracies, but the book is evidently not intended for students; and probably nobody would be more surprised than Mrs. Macquoid herself if we were to take her seriously. What is of far greater importance, considering the class of readers to whom these pages will appeal, is the fact that, although the authoress writes in the present tense, she describes a Perugia which is in many respects different from the Perugia of to-day; and we can well imagine the exasperation of the tourist who, using her book as a guide, goes to look for the fountain in the Piazza del Sopramuro, or for the statue of Pope Julius in the Piazza del Papa. In the place of the former he will find the Garibaldi monument; while the latter has been removed to make way for the electric trams.

One excellent thing Mrs. Macquoid has done, and it should be noted to her credit: she has called attention to the too little-known museum of Professor Bellucci, with its unique collection of charms and amulets; but, when all has been said, the illustrations are by far the most interesting feature of the book. It was worth publishing for them alone.

GISSING'S LAST NOVEL

'Will Warburton'

12mo. Cloth, $1.50.

N. Y. TIMES REVIEW: "The quiet sincerity of the story is so infinitely refreshing that, upon the first reading, one scarcely considers the skill of the literary touch, the ripe art of the narrator, the subtle 'nuances' that give the charm of contrast and variety. Each character, however lightly touched, is true, true to a hair, stepping forth from the page a rounded, breathing figure. It is excellent in workmanship and large of vision; a book that leaves one the better for having read it, and that one likes better with every rereading."

The Usual Summer Educational Numbers of The Nation

Will be issued this year on August 31 and September 7

and will reach the professors and teachers in all the leading colleges and academic institutions in the country. Four thousand extra copies of each issue will be sent to persons interested in educational affairs in addition to those sent to regular subscribers, and as there will be different lists for each of the special editions, advertisements should be inserted in both of them in order to reach the entire list.

The first issue will be sent to teachers of English, Literature, Languages, History, and Economics; the second number going to those teaching Philosophy, Physics and Chemistry, Mathematics, and Natural Sciences.

Copy for the first of these numbers should be received by Tuesday, August 29, and for the second by September 5.

The Nation.

NEW YORK, THURSDAY, AUGUST 17, 1905.

The Week.

Our Chief Executive evidently agrees with a noted philosopher that consistency is the hobgoblin of little minds. Such, at all events, is the reflection suggested by the report sent out from Oyster Bay on Monday that the extra session of Congress had been abandoned. It is true that the successive postponements of the extra session had robbed it of all but a sentimental importance. The three weeks in November, every one knew, could serve no purpose but to save the President's pride. But the "irreducible minimum" now appears to have been given up on the representations of Senator Knox. The President is really to be congratulated on his surrender to common sense. But it must now occur to him that the pace of legislation is often in reality slackened by the premature cracking of the Executive whip. Doubtless among our experienced Senators, as once among those of Rome, "those that understood him smiled at one another and shook their heads." The "continual dropping" of friendly remonstrance, personal appeal, and coaxed delay has served to wear away the stone of adamantine purpose. But what excoriations at the President's hands have "the craven" and "the weakling" suffered for like infirmity of purpose!

Despite the "stand-pat" attitude of the Senate and Secretary Shaw on the tariff, the ghost of revision and reciprocity will not down. President Roosevelt, so it is announced from Washington, has decided to negotiate another reciprocity treaty with Germany. He may have but slight hope of favorable action thereon, but he will at least obtrusively dump on the Senate the final responsibility for any depression in our export industries which may result from the new German tariff after March 1, 1906. It will be well for the worshippers of the protectionist fetish to bestir themselves before that date. Germany has already notified our Government that, after March 1 next, the benefit of "the most favored nation" clause will cease to apply to us. Treaties have already been concluded between Germany and seven European States providing for the mutual enjoyment of preferential tariff rates. There is no way, apparently, of our getting into this charmed circle but by paying the price of admission. The German Agrarians, who have the ear of the Imperial Government, insist as obstinately upon our making concessions as do our tariff Bourbons upon the immutability of the Dingley schedules. We may have a chance to see experimentally what happens when an infinite force is brought to bear against absolutely immutable resistance. Meantime, it would not be surprising to see Secretary Shaw's dictum reversed, and, instead of the Republican party appealing to "the producer," to see "the producer" with burnt fingers appealing to the Republican party to prevent the loss of German markets.

Appeal to our treaty rights as against the Chinese boycott has been made by the Administration, but it can come to nothing. Guarantees in our treaty with China that our merchants shall be permitted to "sell" in each of the ports open to commerce cannot carry with them any correlative obligation on the part of the Chinese to buy. And if the hope is to compel the Chinese Government to put down a strike or to break a boycott, that is a doctrine of international law which would return to plague its inventors. If our Federal Government disclaims the power to prevent Chinamen from being massacred in this country, it cannot very well argue that China is bound to make her subjects handle and buy American goods, willy-nilly. We know precisely how we provoked the Chinese boycott. It was by cruel and discriminating legislation. If we propose to stand by that, let us endure the money loss without whimpering. But if we really desire to remove the boycott, we know how to go to work.

Wu Ting Fang denies that the direction of the Chinese boycott is in his hands. At the same time his attitude, as expressed in his interview on August 9, will give many of our citizens an unexpected sort of shock. The ex-Minister understood this country so well, and was so popular here himself, it somehow seems as if he might take a more sympathetic, a more tolerant view of our present difficulties. But no; while saying that he regrets the boycott itself as calculated to cause friction without good results, he speaks out regarding the provocation given by this country for retaliatory action. He seems not to have any more sympathy with our system of treating every Chinaman as an ignorant coolie until he proves himself something else, than if he had never been banqueted and invited to lecture in every city in this country. The attitude of Americans toward Mr. Wu has, indeed, always been peculiar. He was on such good terms with us that we unconsciously assumed that he must be on our side in any dispute, even if it were with his own country. Some of the comments heard during the Boxer troubles, when he came into such prominence, showed an amusing forgetfulness of the fact that the Minister was, after all, a Chinaman, and presumably a loyal one. When he went back to China, too, his departure was talked of almost as if he were an unofficial emissary of this country. It was a harmless enough consequence of our belief that no one who once studies our institutions can fail to see that they are better than his own, wherever he may live.

The memorial to the Porto Rican Insular Legislature passed by the League of Municipalities the other day, asking for a greater measure of self-government, is in several respects a remarkable document. A certain quaintness in phrasing does not detract from the reasonableness of the plea itself. "We do not believe," acknowledge the petitioners, "that Porto Rico, after obtaining her municipal freedom, will serve as a special model of local administration without a blot or hitch. . . . What we should assert, and do hereby assert, is the right to work out our own salvation and advancement. Let us reap profit from our good acts and derive benefit from the lessons of our errors." Again, "There are cities in the United States, the immoral administration of which gives rise to the protest of all good citizens, but over there no one has ever thought of depriving the municipalities of their autonomy and charging the State with the solution of local affairs." Concretely, what the representatives of these sixty-five insular municipalities desire is the amendment of the Foraker law, the organic act of the island. As this requires the assent of Congress, another memorial is to be addressed to that body. It has been one of the unpleasant consequences of the paternal form of government installed by us in Porto Rico, that it has made the natives look to us for everything, including material prosperity, and hold us responsible for every lack. At best, the present limited local governments are makeshifts.

Two county Democratic conventions in Maryland, those of Talbot and Caroline Counties, have failed to endorse the Poe-Gorman suffrage amendment, and this has put confidence into the opponents of that measure. The attitude in these Eastern Shore counties, however, seems to indicate dissatisfaction with the particular measure to be submitted this fall, and not with the general principle of restricted suffrage. The fact of

the matter is that the Poe amendment cannot stand analysis, no matter with what view it is approached. As the Baltimore *News* says: "If it had been drawn up in great haste under the pressure of some terrible emergency, there might have been some possible excuse for its character." The long open letters published in newspaper advertising columns, which are a time-honored feature of Maryland politics, are playing their usual part this year; "Tocsin" taking the most prominent part for the amendment. But "Publius" has made one retort which reveals as well as anything possibly could the motives behind the movement for disfranchisement. "Ulysses" had asked, "If the negro fusion be inimical to good government, why should not white Republicans be equally detestable?" And Publius thunders back, "They are."

An interesting situation is created in Virginia by the contest for the Senatorship between Senator Martin and Gov. Montague. The primary law which Gov. Montague was instrumental in getting passed by the State Legislature, provides that candidates for the United States Senate shall be selected by the qualified voters of the parties. The State primary is to be held on August 22. In effect, it amounts to the popular election of Senators; and the present campaign has been growing in interest since Gov. Montague early in the year announced himself as a candidate to succeed Senator Martin. This means that, for the first time in many years, the people of Virginia are hearing able discussion of national affairs, and getting an accurate notion of the history and character of the United States Senate. "The fight," writes Prof. W. E. Dodd of Randolph-Macon College, "reminds one of ante-bellum days, when Whig and Democrat, Unionist and Secessionist, met upon every public platform to discuss the issues of the day." The people are listening eagerly to the rivals, thus disproving the familiar argument of the machine boss who asserts that the ordinary citizen cannot be induced to take an intelligent interest in politics. The real difficulty is with the voiceless and conscienceless candidates. Suppose we had in this State a law compelling Platt to go to the people for endorsement on a statesmanlike presentation of State and national issues!

The South Carolina dispensary began on July 1 its thirteenth year as an institution, and the indications are that this will be in every sense an unlucky one for it. Last year its opponents began a bitter, uncompromising fight which not only has put the dispensary advocates completely on the defensive, but brings actual overthrow at least within the range of possibility. There has existed for some time a law which permits counties, on petition of a certain proportion of voters, to hold a special election on the question of dispensary or no dispensary. Two counties, Marlboro and Greenwood, went "dry" many years ago. Last year two others, Cherokee and Pickens, voted out the dispensaries. And now a canvass made by correspondents of the Charleston *News and Courier* shows that in eighteen others elections have been ordered or petitions are now being circulated. In fourteen of these, according to the same authority, the chances are believed to favor the prohibitionists. The dispensary is called popular in only twelve counties, two of these, the so-called "city counties," preferring it to prohibition, although license, which the law does not permit under any circumstances, is the system really desired. Charges of various abuses in the conduct of the State liquor-shops have been current for some time, and an official inquiry now in progress has confirmed the most damaging of these allegations. The testimony given before the investigating committee at Spartanburg has shown the system to be honeycombed by both political and commercial corruption. From the stories told, it appears that dispensers were forced to pay tribute to the County Boards of Control in order to obtain and hold their positions; that they recouped themselves in part by taking valuable presents from liquor houses, or extra quantities of liquors, which they then sold without accounting to the State, and that these liquor agents attempted to dictate the appointment of dispensers. Details were also given of the raising of a fund in Spartanburg which went to a local newspaper to win its support for the dispensary. With all its faults, the dispensary does pay. The citizens of Pickens County, who voted it out a month ago, are already receiving notices of a tax for road improvements which used to be paid out of liquor profits.

In commenting upon the general consternation caused by the arrest of four citizens of western Kansas charged with perjury in connection with fraudulent entries on homestead and timber claims, the Topeka *Capital* remarks: "The fact is that the men are charged with what has become a common practice in the West." One of the accused, a former county clerk, is said to have bought the title to a homestead for $50, and to have furnished the witnesses to swear that the seller had lived on the land for five years, as required by law. As a matter of fact, the land had been taken up only two years before the sale, and had been abandoned. The *Capital* says that many claims in Kansas have been given up in the same way. Homesteaders have often failed to fulfil the residence requirement, though the records show that the customary perjury has been committed in a cheerful spirit. It is unfortunately true that the land laws have been looked upon as obstacles to be got around rather than as a wise protection of the genuine settler's rights. The big cattlemen and the timber speculators have lulled the official conscience to sleep. Land titles have been as easy to acquire as military honors in a South American republic; and it is not strange that the new and stricter policy of the Interior Department confuses the Kansas mind.

Conventions seeking greater uniformity in law or administration in the various States are becoming noticeably frequent. Insurance Commissioners from several States have gathered in this city, in consequence of the Equitable scandal, seeking jointly some light on the situation which shall result not only in greater security but in greater uniformity in the conduct of insurance business throughout the country. The invitation of the Governor of Pennsylvania to the other States to send delegates to the coming interstate congress aiming at more uniform laws on marriage and divorce is another instance. A third illustration of the same tendency is to be found in the acceptance by the Governors of twenty-six States of the invitations extended by the National Civic Federation to be represented at the National Conference on Immigration, to be held in this city in December next. The ever-growing homogeneity of this country, together with the expansion of many kinds of enterprise beyond the jurisdiction of a single State, make the need of such conferences increasingly great. It might not be impossible to organize these noncontinuous conventions in some sort of a central bureau, such as was contemplated in the body of delegates whose function, as originally conceived, was to amend our Federal Constitution from time to time, as need might require.

The avowal on Thursday by the Insurance Commissioners of six States that they were dissatisfied with the Hendricks report is strong confirmatory evidence that the Insurance Department of this State is too deeply immersed in politics to safeguard the public interest. The belated public acknowledgment by its officials that the so-called preliminary report suppressed essential facts such as the Depew loan and the Union Pacific blind pool, throws additional discredit on an already suspected public agency. The powers of the Insurance Commissions from these six States—Wisconsin, Minnesota, Kentucky, Tennessee, Nebraska, and Missouri—while technically small, are in reality extensive. By the recommendation of retaliatory legislation, or the withdrawal of licenses to

New York companies to do business in their respective States, very considerable pressure can be brought to bear. The investigation on which these State officials are intent is technical in its character, as contrasted with the main quest of the legislative commission, which is concerned primarily with past illegality and future remedial legislation. The more light that can be let in on this subject from every quarter, the better will the interest of the policyholder be subserved.

The failure of the Fiala Arctic expedition will surprise no one. From its inception it was doomed to an inglorious end, precisely like its Ziegler predecessor, the Baldwin expedition of 1901. Neither expedition was conceived in the proper spirit, and neither appears to have been vigorously led. Fortunately, there was no severe loss of life in either undertaking, as in other ill-starred Arctic expeditions. On the other hand, the expense of the ventures is probably out of all proportion to the scientific results achieved. Both expeditions were lavishly, if not extravagantly, fitted out at the very time that Peary was walking the streets begging for money for his project. Yet his demonstrated ability to lead and his extraordinary polar experience were overlooked by Mr. Ziegler. This, rightly or wrongly, gave the impression that he was more desirous of achieving fame for himself than of insuring the discovery of the Pole. Certainly, Mr. Peary's admirers will now be more than ever convinced that if the money wasted on the Baldwin and Fiala expeditions had been put into his hands, it would have made certain the success of his undertaking by enabling him to plan his work on a larger and better scale than hitherto.

The Czar has approved the project for a national Parliament. If the Japanese terms at Portsmouth are regarded as too severe or humiliating for acceptance, this grant of an elective assembly may easily become the popular rallying-point for a continuation of the war in the East. If, on the other hand, peace is concluded with Japan, the concession of a representative element in the Government may be used to bolster up the waning prestige and popularity of the ruling family, grand dukes and all. The newly created Legislature is to number about five hundred members, chosen through a system of indirect election. Its functions will be mainly deliberative and consultative. It will thus have the right to express the aspirations and sentiments of the Russian people. Further than this, the national assembly will have the right of veto upon ministerial proposals laid before it, provided a two-thirds vote can be obtained against a projected law. Englishmen and Americans would feel more confident of its eventual success if the power of the purse were indisputably committed to its keeping. Without control over supply, constitutional government is likely to degenerate into a farce. The nature of the newly created body will, it is said, be proclaimed in a coming manifesto, and its first session is set down for November.

Norway's practically unanimous vote for secession was to have been expected. Her leaders have taken no step without being fully in touch with popular sentiment, and this has favored extreme measures, with an intensity of feeling very difficult for foreigners to understand, since there is no immense issue like that of slavery to make men favor disunion. Whether the old union with Denmark will be reëstablished in the shape of an understanding; whether Russia will be emboldened to move upon Sweden, and whether Germany will profit by the realignment, are questions eagerly debated abroad. Björnstjerne Björnson, writing in the *Figaro*, thinks that the divorce of Sweden and Norway may possibly result in a formidable alliance of all the Germanic peoples in the world, which he would like to see. This Pan-Germanic League should, he thinks, include Great Britain, the United States, Denmark, Germany, Switzerland, Belgium, Holland, Austria, Sweden, Norway, and even Luxemburg. Such an extraordinary combination would surely be thought to destroy the Russian peril, the Slavic peril, and the Yellow peril by creating a Germanic peril.

With French soreness over the Morocco imbroglio what it is, it is hard to understand how Germany could wish further to complicate matters by putting through a loan to the Sultan in advance of the projected conference. Yet it is reported from both Berlin and Paris that this has been done, and dispatches from the former city are calling attention to the political as well as financial value to Germany of the loan of $2,500,000 to the Sultan of Morocco. Fully three weeks ago the move was rumored, but at the time Paris was quieted by denials. The latest news, however, is that the French are indignant over the statement that the loan is an accomplished fact. It does not ease the situation for them to be told that the loan is "personal." The Sultan's personality cannot thus be severed from that of his State. If ever a monarch could say, "L'état, c'est moi," it is the Sultan. To loan money to him is practically to loan money to Morocco, and the French contention is that this is a violation of the agreement to leave everything as it was till the conference. Probably some explanation will be forthcoming from Germany.

Distress and consequent disorders in the south of Spain appear to be mounting every day. Painful stories of starvation and of a sort of reign of terror seem to be only too true. The state of things was clearly foreseen, however, months ago. A practical failure of crops in Andalusia, Estremadura, and in parts of Aragon was made certain by the unprecedented drought through the winter and early spring. The worst fears have now been realized. Hundreds of thousands are reduced to misery. A couple of weeks ago, in the city of Cadiz, no less than 20,000 out of a total population of 70,000 were asking for public assistance. Since then affairs have grown worse through all that region. The telegrams report that the rich are fleeing from their homes in dread. There is a peculiar reason for this. Most of the land in Andalusia is held in vast estates, the peasants being practically tenant farmers. This system of *latifundia* tends both to unscientific agriculture and to intensified class feelings. When famine comes, the peasants, who at best have but a narrow margin separating them from want, turn upon the great landlords as so many despoilers. Add the depreciated currency and the high prices of the necessaries of life, and you have a situation truly unhappy. The new Liberal Ministry will have its hands full in bringing the country safely through so severe an economic crisis.

Rumors of the impending retirement of Lord Curzon, Viceroy of India, are again current. The recent enlargement of the powers of Lord Kitchener without previous notice to the Viceroy provoked so sharp a protest from the latter that the Government receded in part from its original position. Friction is still said to exist between the two, and this, combined with the ill-health of Lord Curzon, is given as the probable cause of the latter's retirement. His resignation is expected even before the Prince of Wales sets out on his projected tour to India. In connection with the prorogation of Parliament, it is at least interesting to note the conjecture freely hazarded in England that Lord Curzon, provided his health permits, will one day succeed Mr. Balfour as leader of the Conservatives. Their electoral *débâcle* cannot be deferred much longer, and the Liberals are then almost certain to come into office. As leader of the Opposition and reorganizer of the jarring elements supporting the present Government, Lord Curzon might easily be the person selected. Not only is his ability acknowledged on all sides, but he is fortunately not committed to any of the fiscal heresies which have proved such a source of bickering and weakness in both Unionist and Conservative ranks.

THE PRESIDENT'S AUGUST SPEECHIFYING.

It was Mr. Root, we believe, who described the President as a man of such simplicity that he "thinks out loud." The loud part, at least, may be freely admitted. And as for the ingenuousness of Mr. Roosevelt in letting the people know how his mind is working, that, too, is pretty obvious. With him, coming events, or what he thinks or hopes will be coming events, cast their shadows before in a speech. He was plainly thinking out loud on Friday at Chautauqua, and went further than he ever has gone before in letting the world see the play of his intellect about the Monroe Doctrine.

Apparently, he wished to inform European nations, with the South American and West Indian republics, as well as his own countrymen, that all his intentions are honorable and peaceful. It may be that he thought his words laid down a policy absolutely clear and safe; but we fear that the interested foreigners who have long been eagerly asking Americans just what President Roosevelt means to do under his interpretation of the Monroe Doctrine, will be thrown by his language into redoubled uncertainty. For note the exceedingly vague definition by the President. He does not propose to allow the Monroe Doctrine to become "fossilized." It must be continually "adapted" to "meet the growing, changing needs of this hemisphere." In other words, the Doctrine is a conjurer's hat, out of which anything he pleases may be pulled. It is like Newman's theory of the evolution of Catholic belief—whenever you need a new article of faith, you have the authority ready to produce it. The Monroe Doctrine being thus conceived of as embodied national wilfulness, President Roosevelt serves notice that we shall employ it as a justification for whatever we choose to do—meanwhile, keeping the nations guessing what that choice will be. Nothing can be more disquieting in international relations than such indefiniteness. "That is the very reason we regard President Roosevelt as a dangerous man," said a Frenchman recently; "we don't know what he is going to do. He is like an automobile running wild, which may lurch in your direction at any moment."

Disposed as he is to make the present-day use of the Monroe Doctrine as putty in his hands, it is not strange that Mr. Roosevelt reads into its history what he pleases. He says it was designed to prevent "great military Powers" from obtaining new footholds in this hemisphere. But the real objection was, not that the Powers were military, but that they were distant and alien. The Monroe Doctrine was, in its essence, a charter of self-government. It was a protest against any government, good or bad, being forced upon a people across the seas. But of all that President Roosevelt has entirely lost sight. Force is not repugnant to him provided he do the forcing. Europeans must not impose their will upon our sister republics, but we may freely. An unconscious juxtaposition in the President's speech brings this out with really comic effect. He, "personally," does "not want to see any foreign Power take possession . . . of the custom houses of an American republic in order to enforce its obligations." Noble love of independence! we at once exclaim. Splendid hatred of oppression! But Mr. Roosevelt instantly adds, "The alternative may at any time be that we shall be *forced to do so ourselves*"!

The course which he distinctly marks out for himself is that of a roving policeman, with no orders except his own instincts (which he protests are good), seeing to it that the republics of the Americas each maintain "a just and orderly government." The judge of what is just and orderly is, of course, himself. One thing upon which he comes out strong is that they must pay their debts. Only, he puts in the caveat, the debts must be just—"we shall ourselves thoroughly examine all these claims, and see that none that are improper are paid." And he thinks in this way to quiet international controversies! Why, for every question he lays by such means, he will start up ten new ones more dangerous. He may settle our own disputes with the Dominican republic, but, in the act, embroil us with France or Belgium or Germany by his off-hand decision that their claims upon San Domingo are "improper." It is a perfect thicket of nettles into which he is jauntily thrusting his hand.

In the President's passion for making the world altogether such as he is, he ignores one of the fixed elements of the problem. This is the obstinate preference of people that have tasted liberty and seen that it is good, for doing things in their own way. It may not suit us, but if it suits them, that means contentment, self-respect, freedom to develop along natural lines. Those are political blessings, all of which would be destroyed by such a forcible imposing of the will of a foreigner as President Roosevelt proposes. He is almost painfully conscious of his own benevolence, but he does not see that benevolence at the tip of a bayonet may be hateful. The satisfaction of self-government appears to mean nothing to him—that is, in another. If any nation should undertake to cripple our sovereignty as he proposes to do that of our neighbors, he would be the first to draw an indignant sword. But others he is for clubbing into order. He knows nothing of that large and serene confidence in liberty which Thiers had, who called it a "great lottery organized by the Creator," in which the nations do well to take shares since, "even if they lose sometimes, they oftenest gain." Our fathers thought the free choice of the governed results in a better government than can be imposed from without even by the wisest and most benevolent Sultan, Czar—or President.

No one can read attentively the President's remarks at Chautauqua about railways without seeing that he is not nearly so sure of his ground as formerly. He betrays a nervousness and irritability on the subject, quite new to him. No longer is he for the bill, the whole bill, and nothing but the bill to fix rates. All that he asks now is power to "remedy the abuses in connection with railway transportation." Not yet, it appears, has he looked to see if existing law does not furnish adequate power, provided that it were used. And how, after having refused to allow his chosen investigators to prosecute Paul Morton, can the President rage, as he does, against those rich men who knowingly violate the law? He may be sure that the Morton case will be thrown in his teeth many times at Washington next winter. How unconsciously Mr. Roosevelt drops into the language of a benevolent autocrat, is seen again and again in this speech. He says that it is "impossible" for him longer to show "leniency" to offenders against the anti-Trust laws. But that is the tone of a gracious monarch. A Constitutional President has no business to be either lenient or merciless; his sole duty is to enforce the law. And what could be more futile than the President's begging the corporations to acquiesce in the "mild kind of governmental control" he proposes, lest some agitator come to power and deal with them in a far more "drastic" manner? Sensible men will consider his proposals on their merits; as they will those of the wilder confiscator when he turns up.

Chautauqua had been preceded by the temperance convention at Wilkes-Barre. Here the President's vehement nothings suffered by comparison with the quiet but piercing directness of the Catholic priest whose letter he quoted. If the President must preach, the priest shows him how to do it. With his eye on the facts, the clergyman states how prone workingmen are to abuse their opportunities. "The higher the wages, the more money they spend in saloons. The shorter the hours, the more they absent themselves from home. An apparent disregard for family ties is growing." Beside such study at short range of the actual working of trades unionism in the anthracite regions, the President's balanced phrases appeared more than ever like a juggler's tossing of his balls—"I strongly believe in trade unions, wisely and justly handled, in which the rightful purpose to benefit those connected with them is not accompanied by a desire to

do injustice or wrong to others." That is very like confessing faith in a vacuum. For our part, we feel that the President missed a fine chance to utter a forcible and timely word. The coal workers are being artfully plied by agitators with every incitement to discontent and trouble-making. Their leader, John Mitchell, lives upon disturbance, and has openly threatened it for next year. He practically annexes President Roosevelt as a fellow-unionist and a sympathizer. The opportunity for a strong disclaimer and for sound if unwelcome advice was tempting; but the President preferred to hide himself in a cloud of meaningless platitudes.

TRUSTEES OF CIVILIZATION.

The addresses of Secretary Taft in Manila and the comments which the Secretary's words have evoked are peculiarly significant. It is no mere picturesque junket that he is conducting, albeit the welcome accorded him has not been devoid of Oriental color. It is clearly not a purposeless tour of inspection to satisfy an aimless curiosity that has been in progress, but the carefully calculated semi-official entry of an accredited minister of a distant sovereign. Mr. Taft's former official position in the Philippines, his present status as *de facto* Minister for the Colonies, and the not at all violent improbability that he may be his party's nominee to succeed President Roosevelt—all conspire to confer triple importance upon his well-weighed declarations of the Executive's purposes as regards the Philippines.

It was on Friday last that Secretary Taft explained the alignment of American opinion upon the question of our colonial possessions in the Pacific. He conceded frankly that there was "a considerable number who have the real Imperialistic idea." The "real Imperialistic idea" he described as "extending the influence of America, by purchase and conquest, into the Orient . . . for the purpose of controlling the Pacific and getting the largest share possible of the Orient trade." The second party —and this he declared to be the most numerous—are those who originally saw with reluctance our sway extended over the Philippines, but who now take the view that we are by the fortune of war constituted trustees for the Filipinos. According to this view, Providence, like a glorified Mr. Ryan, has made us the guardians of the interests of untutored millions in the Pacific, and consequently it falls to us to preserve intact the assets of self-government, which in due time we shall pass over to the policyholders. Still a third attitude of mind the Secretary refers to in his mention of those who would immediately give up the exercise of authority in the islands. The two factions who support this policy do so from the most curiously contrasted motives. The first desire to relieve the United States of a burden; the second to relieve the Filipinos of an injustice. The former would escape from an expensive liability; the other would atone for what they conceive to be a national sin.

The Secretary's remark that "this third party has been twice defeated in an election on that issue" was doubly inaccurate. It overlooked the fact that withdrawal from the Philippines has never been more than a collateral issue in our elections, Congressional or Presidential. It also obscured the fact that one faction which to-day advocates getting rid of the Philippine incubus is of quite recent origin, and reflects the growing attitude of the man in the street who has no interest in the distant archipelago, and is annoyed at having its affairs thrust upon his attention.

But it is mainly with Secretary Taft and his co-trustees of civilization that we have to do. That this comfortable notion of trusteeship for an inferior race is held in good conscience, but with a somewhat somnolent indifference by the greater number of unreflecting voters, is not improbably true. We desire to address ourselves to these trustees in the capacity of legal adviser, for it is by no means certain that they will not eventually be ousted on the ground of incompetence to administer the trust in question.

First of all, it is worthy of notice that this humanitarian philosophy, the deed of trust as it were, is an instrument of very doubtful validity. We had taken Manila by reason of our war with Spain. We were confronted with a native movement professedly aimed at autonomy. This we crushed by force of arms. The uneasy conscience of our democracy demanded a salve, and the doctrine of trusteeship was concocted only after military conquest was under way. Besides the spurious origin of this doctrine of an international trust, it is also to be noticed that the deposit of civilization supposedly committed to our hands during the minority of our Filipino wards has been devised on purely à-priori grounds. It meets not the requirements of a sub-tropical race backward in the march of industrial progress, but the needs of a highly developed economic organism habituated to universal suffrage and presupposing universal education. We are to educate the Filipinos up to the competence for autonomy, but the autonomy may not be that of Japan, for instance, but must be like our own. A careful student of the matter has declared that "in history we have no example of the autonomy of one nation being created by the efforts of another, and no nation has as yet successfully determined the social evolution of another race by conscious political methods." Secretary Taft, since making his now famous speech in Manila, has stated that, "if the government of the country [*i. e.*, the Philippine Islands] were transferred now, it would soon be controlled by those who hold mortgages." This, it must be confessed, is a horrible alternative; but as between the native mortgage-holder and the alien office-holder, the choice is not an easy one. Not even the native mortgage-holder would proscribe free trade, the one indispensable stimulus to the industrial growth of the islands.

Moreover, President Roosevelt, Secretary Taft, and the other trustees must be aware that their benevolent object has not only to overcome the opposition of the Filipino, but the avowedly selfish and conscienceless purpose of those described by the Secretary as having "the real Imperialistic idea"—exploitation of the native through lust of gain and blood. The trader who wants the monopoly of the Philippine market, the home producer who will not concede the least competition of Philippine products, the concessionaire who thirsts for franchises, the military man who has little sympathy with real democracy, are all prompted by selfishness to thwart the purposes of this international trusteeship. The potential enemies of the benevolent plan are still more numerous than the classes already enumerated. As Hobhouse points out, "In relation to dependencies and weaker races our imperial democracy is a governing class, and it can only be taught as other governing classes have been."

Last of all, the success of our experiment with our subjugated wards so far has been most meagre. Secretary Taft says that complete self-government is unthinkable for a generation or more. It is a question whether all our work in the islands may not be undone. The *Army and Navy Journal* of August 12 says "the withdrawal of military control was premature and unsafe," and that "beneath the surface of an insecure peace" is "widespread native discontent and disloyalty." The same journal declares that Gov. Wright's utterances on July 28 "are the first official acknowledgment" of these facts, and that the situation "requires a prompt and radical revision of our Philippine policy." We think that this is not unlikely, but, instead of favoring "a reorganization of the whole administrative system along military lines," we would suggest to the trustees of civilization to reconsider their problem in the perspective of history, and to inquire whether there is a reasonable prospect of success along the lines of their present policy.

SECRETARY SHAW'S SPEECH.

Any lingering doubt that Secretary Shaw is a candidate for the Presidency was dispelled by his speech at Roanoke,

Virginia, on August 8. He spoke under an August sun, much less exhilarating, one would suppose, than the "October sun" of Webster's last appeal for the Presidency in the same State; but his address is as unmistakable as was that of the defender of the Fugitive Slave Law, a half-century ago. It is, in fact, all adrip with Presidency-seeking. No public orator not in quest of the White House as a residence is compelled to utter just the sort of platitude and forced compliment which inexorable custom requires of a Presidential candidate. The people whom he happens to be addressing are always just a *leetle* the finest that it has been his good fortune ever to have met, etc. For details, see Mr. Shaw's tribute to the Virginians; also, Birdofredum Sawin's election address.

Those flourishes safely over, the Secretary settled down to his argument, which is about the crassest bit of protectionism that we have had even from him. There may be method in this. If President Roosevelt is not again frightened away from his determination to urge tariff revision upon Congress, it is quite possible that there will be something like an upheaval in the Republican party. The Protective Tariff League and the Home Market Club will then be looking about for the most reactionary and blind protectionist "wholehogger" in public life, and their eye, Mr. Shaw aparently hopes, will naturally fall upon him. At any rate, his speech has much the effect of hanging a placard upon his breast, reading: "For undiluted tariff Bourbonism, apply within."

He says that he and the protectionist policy peculiarly address "the producer." This is an irresistible reminder of one of Dr. Johnson's colloquies: "Were not Dodd's sermons addressed to the passions?" "They were nothing, Sir, be they addressed to what they may." Secretary Shaw's reasonings and appeals are so behind the times, so off the facts of the actual situation, and so little in touch with the opportunities and the duties now confronting the country, that they can only be set down as foolishness, whether they be addressed to the producer or to his despised consumer. For he betrays no glimmering sense of the moral questions involved. He refers to the duties of 10 per cent. on cut diamonds, and the industry it has transferred to this country. Has he never heard of the evil results of the McKinley duty of 25 per cent. on cut diamonds—how it provoked smuggling on an enormous scale, and finally drove the dealers to admit that they had asked too much protection? That was before Mr. Shaw's term as Secretary, but such a student of the subject as he is should have known of the incident and reflected on its teachings. Yet the tariff as the mother of cheating and perjury seems never to have swum into his ken.

No more does he consider for a single moment the political and social mischief of the tariff, as it actually exists among us—that is, as secured by bribery, scrambled for as a piece of party favoritism or plunder, and, by its operation, intensifying class feeling, stimulating discontent, and making the way straight for socialism. Furthermore, the Secretary lisped not a syllable about the bearing of our protectionist system upon our relations to world markets and foreign nations—above all, just at present, to our dependent subjects in the Philippines. Almost at the very time when Mr. Shaw was speaking, the foremost Filipinos were appealing to Secretary Taft and the visiting Congressmen for a "square deal" on the tariff. By that they mean either greatly lowered duties or free trade. But if Secretary Shaw has his way, they will get the least square deal imaginable. His beatific vision is of a tariff that will keep everything foreign out, and maintain every product and necessary of life within our sacred Chinese wall at the dizziest of high prices.

In all that the Secretary says about screwing the cost of everything up to the highest possible level, and living happily ever afterwards, he has the air of a man emerging from a long stay in a cave. The sun is shining and he can only blink at it! We have so long and so unhappily made experiment of the protection which protects everybody, and then protects nobody. The result is an artificial state which is both precarious and perilous. When all are once jacked up together, the only question is when all will fall in a heap together. Yet, while we remain jacked up, everything gets capitalized at an artificially high figure. How this disables us in foreign competition has often been shown. And it is just the problem how to get our share of the world's trade which is now pressing hardest upon American manufacturers, leading to party revolts and upsets in New England, to reciprocity conventions and other forms of agitation for tariff revision in the West. Yet the Secretary of the Treasury has not a word to say about it. He appeals to the American producer to go on taxing himself rich, while what the said producer is crying out for is such a relief from tariff taxes as will enable him to compete in foreign markets. American production has outrun the infant stage. Mr. Shaw's cradle song is fearfully out of date. We are waking up to the great race for industrial supremacy which the leading nations of the world are entering upon, and we find ourselves too pursy and short of breath to run well. But when we propose to go into training and get rid of superfluous and embarrassing flesh, the Secretary of the Treasury tells us that our true wisdom is to go on gorging upon protection, and get fatter than ever.

HOW PHILADELPHIA WAS BLED.

The President's godspeed to Mayor Weaver, on Thursday, in the work of pulling down the gang that has made Philadelphia a synonym for corrupt municipal government, calls attention afresh to what is going on there. Just now the city is digesting a long affidavit made by a contractor who had been ruined and driven from Philadelphia by ring methods. The statement of this man, George C. Dietrich, casts a lurid light upon the ruthlessness of men who rule a city for what they can get out of it.

Dietrich was ruined because, in 1902, he underbid the firm of D. J. McNichol & Co., the ring's favorite contractors, for the job of building a pumping plant, a part of the great filtration system of Philadelphia. Successful on the first bid, Dietrich, who was outside the political breastworks, saw the plans altered, "to reduce the estimated cost," and the work readvertised. On a second bid he was again successful, his offer of $532,000 being $191,000 lower than McNichol's, and yet leaving, as he figured, a margin of $120,000 to protect himself against accidents and delays, and to provide a reasonable profit. But he had not figured on the cost of protecting himself against the persecution of the ring that was enraged at the loss of a good job. In the three years since he undertook the work, however, he has learned the price of opposing the men who have been perhaps the most successful followers of the Croker theory of municipal government that the country has produced.

In the first place, as his affidavit shows, Dietrich was told that a certain bonding company would furnish his bond to the city. A Philadelphia Councilman was the company's agent, and, after putting off the contractor for eight of the ten days in which the bond must be filed after the contract was signed, told him that the company had refused to stand behind him. Failure to file the bond in the ten days would have involved not only the loss of the contract, but of the $15,000 deposited with the bid. From another company Dietrich got a bond that the city had to accept, and it was then that he began to comprehend the difficulty of "raising doughnuts in a potato patch." John W. Hill, who was recently removed from office by Mayor Weaver, was the supervising engineer of the filtration plant. A tool of the gang who had sworn to "break Dietrich for butting in," Hill began by condemning some 5,400 barrels of cement really above the specified quality. In getting this decision reversed, Dietrich learned that he must buy his cement from a certain firm approved by the combine. In whatever direction the contractor turned, he found Hill blocking his way. To one of his inspectors, who was assigned to watch

the building of the pumping station, Hill said: "Keep after that Dutchman [Dietrich]; you must nail him down to a hair." This injunction was obeyed. The "Dutchman" gives some details:

"I started to do the concrete work, and before doing so I purchased two McKilvery concrete mixers, and had them delivered at Lardner's Point. The two mixers were seen by John W. Hill a number of times before I started to use them. He made no objection, and allowed me to use the mixers until they became second hand and it was impossible for me to return them to the McKilvery people. After they had been used for a short while, Mr. Hill condemned the two concrete mixers, and allowed me to furnish and set up a Chambers concrete mixing machine.

"This he allowed me to use until it became second hand, and then said the other contractors were complaining because he was allowing me to use a Chambers machine, and that he would have to condemn it, and not allow me to use it any longer. On station No. 3, Ryan & Kelley's [an 'approved' firm] job, John W. Hill allowed the use of the same make of machine. So he insisted that I get a cube mixer. I bought a cube mixer, set it up, and ran it for about three weeks. After that was second hand, he said, 'Dietrich, you can mix your concrete by hand.' These concrete machines cost me upward of $5,000 set up. And all they are worth second hand is practically as old junk."

Hill's inspector, after reading the contractor's affidavit, declared the other day that the case had been understated. "In all my experience," he said, "I never knew of a contractor on a big operation to be so hampered, harassed, bullied, and annoyed as was Dietrich." But the baiting was effective; the contractor turned over the cement work to a subcontractor to whom he sold, at half-price, some sixteen carloads of limestone grit that Hill's inspectors had rejected. This material was immediately used by the sub-contractor, a man approved by the ring, and no inspector went near the work. Dietrich got into financial difficulties in January last. He found that he could not force a settlement with the city, and the bank from which he had borrowed money came to his assistance. "I agreed with the cashier," he says, "to have some one see Mr. Durham [then the unchallenged boss of the Philadelphia ring] in reference to a settlement." The man was found, and Durham was seen. The cashier reported that Durham said to the agent: "Had I known that your bank was interested in Dietrich, I would have told them to keep hands off." The result of Durham's intervention was that Hill agreed to approve the completed work provided Dietrich signed a waiver of all claims against him and the city. Pressed by creditors, and attacked openly by McNichol as incompetent, Dietrich left Philadelphia in July "for a few days' rest." "The losses I had sustained had almost driven me insane," he wrote to a creditor. He told a friend that he was to return about the 14th. His friend wired: "Stay where you are; your creditors are falling over themselves." So Dietrich gave up and went to Seattle.

The contractor's story has been verified in practically every particular; and it is expected that Mayor Weaver's investigators of the ring's methods will induce Dietrich to return and assist in the work of catching and jailing some of those buccaneers who so successfully allied "business" and politics in a corrupt and heedless city.

THE FUNCTION OF STATISTICS.

Philosophers have often bemoaned the slight effect which great mechanical inventions have had upon the moral betterment of mankind. Ruskin, in one of his typical jeremiads, deplores the fact that, while we refine, polish, and temper the metals, we are as backward as our forebears in all that makes for uplifting the human spirit or brightening the outlook of mankind. And Emerson sounded much the same note in his disparagement of the purely material progress of the age, where he accuses the space-defying telegraph of bearing "nothing on its beam."

One agency, however, which owes its being largely to the scientific tendency of our age, is often overlooked or underrated, despite the fact that its contribution to the sum of social improvement is by no means negligible. This agency is the compilation and application of statistics. It falls frequently, we must grant, into grave disrepute. Its early pretensions were often ludicrously excessive. It is perverted occasionally, as in the recent cotton report of the Agricultural Department, to base uses. But when all is said and done, it remains an indispensable aid to the intelligent legislator and to every serious student of social conditions. The railroad or the telegraph has transformed the conduct of business hardly more than have statistics the work of legislation and administration. These services were emphasized at the tenth session of the International Statistical Institute, recently held in London. A survey of the progress of statistics reveals the interesting fact that they are almost coeval with the century of great mechanical inventions. The steam engine is practically of the same age as this method of assessing the facts of society; and the great expansion of statistical activity is almost conterminous with the Victorian era, which witnessed the growth of banking, railways, telegraphs, and telephones. This industrial development may in reality be regarded as the stimulus of the science of statistics. It furnished most of the data to be scrutinized, and it made their analysis worth while.

The International Statistical Institute represents a movement for the essential improvement of this agency for social reform. The enhanced utility of the telegraph when the feasibility of an ocean cable was demonstrated is to be repeated, as it were, in the moral sphere by making scientific statistics no longer insular or continental, but universal. Students of comparative economic conditions know what difficulties are presented by the reduction of the statistics of different nations to a common basis. The different systems of classifying Governmental expenses in different States make comparative public finance still a matter largely of conjecture. Many of the papers presented at the recent sessions of the Institute have been devoted to just such attempted comparisons. City mortality, the classification of occupations, the methods of industrial remuneration, and the mutual relations of international trade have all illustrated the diversity of methods of computation. Foreign trade, in particular, would seem to demand some international coöperation if its statistics are ever to become satisfactory. It is not at all reassuring to have the British blue-books tell one story and our own Treasury statistics another. Collaboration in this domain would make statistical uniformity possible, not only in the valuations attached to merchandise imports and exports, but in the estimates of those more recondite factors in foreign trade such as freight charges, travellers' drafts, embassy and naval charges, interest remitted on foreign investments, and the like. These "invisible imports," as they have been called, will be dragged fully to light only by conjoint effort.

It is a fact of significance that the tone of professed statisticians nowadays is so restrained and yet so hopeful. In the bright lexicon of its youthful imaginings the case was far otherwise. It was supposed that a social physics was all but within our grasp, and sociology was to be added to the list of predictive sciences. There was often apparent a note of hardness, contemptuous of the age-long à-priori speculations on politics. It was somehow imagined that, through the agency of this new method, objective fact would impinge uncolored and undistorted on the mind. No reputable and thoughtful student of statistics would to-day hold a brief for that early conception of the function of the science. Curious as it appears, statistics can never be absolutely divested of the personal equation. They can never make even a beginning except by assumptions. Vital statistics illustrate the matter perfectly. It would seem as though birth-rates and death-rates could depend on nothing but accurate counting and properly calculated percentages. But at the outset some purely conventional treatment of still-births must be adopted. Whether they are counted among both births and deaths, or among one only, or discarded altogether, will make a very perceptible difference in the numerical results. Moreover, at the beginning it

must be decided whether the percentage of births and deaths is to be computed on the basis of the initial population, or upon the basis of the population as its numbers are altered by these very processes.

Indeed, the very humility of statistics is its salvation. In the tangled web of social life there are so many inter-related strands of cause and effect that we can never hope wholly to disentangle any one thread and with absolute accuracy determine its influence. Statistics, however, indicate certain currents or streams of social tendency, and afford a basis of reasoning on the ground of probabilities, instead of leaving us to pure unverifiable conjecture.

It was a curious exemplification of the attitude of the modern scientific statistician to note how the obsolete and somewhat exaggerated note sounded by Mr. Leonard Courtney in his speech at the Lord Mayor's banquet was the target of quiet banter. Mr. Courtney said: "There was a poetry of statistics, and, if they had only got the gift divine, they would be able to see, in the arrays of figures which seemed so dull and uninviting, pictures of the movements of life as exciting and interesting as any poetry could contribute." To this Lord Onslow, for the statisticians, retorted good-naturedly: "Their work and duty was often termed dull. It was the business of the statistician to state facts, and the business of the statesman to made deductions from them. The facts were sometimes dull, but the inferences were almost always entertaining. [Laughter.] The statesman drew true inferences from the facts, but the politician, he regretted to say, often ventured into the realm of prophecy. [Laughter.]" It is a good omen that the newly born science acknowledges herself only a humble vestal in the Temple of Truth.

CRITICS OF THE CENSUS.

It has been pointed out by a preacher of a curious turn of mind that the only public evil charged against Satan in the Old Testament was the taking of a census. And it will be remembered that when "Satan stood up against Israel and provoked David to number Israel," the consequences to all concerned were dire in the extreme. In modern times, too, so much bad feeling, such endless recriminations, are left behind by the census man that the belief in Satanic influence is still very plausible.

This is the year for State censuses, half-way between the counts of the Federal Government. As a rule, the actual enumerations have now been completed, tabulated figures are just beginning to dribble from the various central offices, and from one locality after another rises the regular quinquennial howl of protest against the accuracy of the results, whatever they may be. A large proportion of the Massachusetts towns and the southern counties of Minnesota are among those registered as actually losing population; while Milwaukee and Portland (Oregon) are leading at present in the complaint that they are not credited with all the gains they have really made. Milwaukee admittedly had 285,315 residents in 1900 and Portland 90,426; now the State authorities give them respectively only 312,954 and 111,000. "Only 22 per cent. gain," sigh the Oregonians, while the idea that Milwaukee has added only 9 per cent. to its population in five years is too ridiculous for discussion. Des Moines, though a much smaller city than either of these complainants, has succeeded in obtaining a partial recount, and thereby raised its population at a stroke from 74,174 to 75,428, which not only entitles the city to be mentioned hereafter in the class of those "of 75,000 or over," but automatically increases the salaries of the mail carriers.

Arguments against the correctness of a given count are never lacking. First, and perhaps simplest, one can go out and discover persons who were not counted. Some of them will almost surely be persons of great consequence, whom the canvassers for the Social Register or even "Prominent and Progressive Men" would not have thought of skipping. Their omission, therefore, gives the chance for ridicule. "If they didn't see George W. Binks, what in the name of goodness could they have seen?" After thus casting a whimsical doubt on the competency of the enumerators, a more serious argument is presented in the shape of a computation based on the city directory. Milwaukee's directory, for instance, contains 24,637 more names this year than it did in 1900. "Is it possible," asks the publisher of this work, "that I should have found over 24,000 of the 27,000 people who are all the increase given us by this census?" After the directory argument come the ratios of school population, the number of new buildings put up, the postal receipts, the registration and vote, and, finally, the "careful estimates of conservative citizens."

It certainly does not behoove any city which, like New York, has had its noses counted this summer, but does not yet know how many were found, to make light of protests of this kind. We may be making one almost any day. If the State census should give this metropolis a paltry 200,000 gain, for instance, the welkin would be made to ring, without doubt. Boston, too, is anxiously awaiting an announcement of her growth, and would not take a disparaging showing in silence. A peculiarly reproachful tone is adopted when a census taken by the State itself has failed to do justice to its own communities. This summer wrangling, while perfectly natural and to be expected, is really a phenomenon of not a little import.

Population is, of course, a peculiarly tender point. Every city of 25,000 maintains a "Forty-Thousand Club," every city of 75,000 a "Hundred-Thousand Club"; Chicago has, we believe, a "Three-Million Club." And the census-taker can, with a single line of figures, blast or exalt the reputation of any of these praiseworthy organizations. But the notion that the function of official statistics is to aggrandize somebody or something has a far wider prevalence. What are a good proportion of the attacks on the Government's crop service but very thinly veiled assertions that the crop reports exist for the special purpose of getting the farmer high prices for his products? It is easy to trace the same doctrine into still further implications. Would Carroll D. Wright, for instance, have been applauded by the Republican Administration as a good and faithful servant if his famous report on "Wages and the Cost of Living," issued on the eve of a Presidential campaign, had shown that wages had not kept pace with the cost of living? No one has charged the deliberate falsification of statistics in the generality of the Government's work, yet the fact remains that the output of the various statistics-producing bureaus is regarded as a legitimate asset of the party in power, as much as the third-class postmasters.

If he is actuated by improper motives, the maker of statistics certainly has large indirect powers. It is not purely sentiment that makes Milwaukee fight against reduction from twelfth city to fourteenth, and Portland cling to her place as forty-second. But though we argue that such and such figures must be wrong, no one can say positively what they ought to be without doing the work over again, and that is usually out of the question. So the critics of the census are themselves vulnerable. One Milwaukee paper, which seems to be little concerned over the possible recount, asks: "Why would it not be a wise precaution to have the City Council pass an ordinance requiring the counters to find 350,000 people, flat? Or how would it do to decide by vote what the population of Milwaukee shall be?" Often ways almost as preposterous have been adopted to "make things come out right" by statisticians who knew beforehand what the result ought to be.

THE SAFETY OF SUBMARINES.

The discussion of the safety of the modern submarine has lately been raging on both sides of the Atlantic since the series of accidents of the last three or four months. In these mishaps, skeptics as to the usefulness of the submersible torpedo boat have seen a distinct limitation of the powers of such

craft. They even hint at radical defects not yet discovered. The makers of the boat which sinks evenly on its own keel eagerly point out that the accidents have all occurred on vessels which dive headforemost when descending; and they have a very strong case. In England, two weighty authorities, Sir William White, for many years chief constructor of the British navy, and Capt. Bacon, R. N., who has lately been in charge of the English submarine tests, have been discussing the recent accidents; Capt. Bacon having read a striking paper on "The Causes of Accidents to Submarines and their Salvage" before the Institute of Naval Architects.

Capt. Bacon affirmed that dread of danger on submarines is far greater outside the King's navy than within. There is reason for this. When an accident does happen to a boat, the entire crew is generally lost, and under circumstances all the more distressing to the public because death in this new form permits of free play of the imagination. Yet the sufferings of the *Farfadet's* crew as they knocked hopelessly against the sides of their steel coffin and felt their air gradually giving out, were, after all, only what happens to hundreds of miners, of whose entombing and slow suffocation people read without unusual perturbation. In a navy, men are accustomed to take chances. A certain number meet with violent deaths every year, even in time of peace. There were 70 accidents to ships in the British navy in 1903 which cost lives in 27 cases; in 1902 there were 93 accidents, which resulted in 106 deaths. What counts is not so much the danger arising from the storing of great quantities of energy in an easily available form; the true measure of the peril is the skill required and the adequacy of the appliances used in emergencies. Capt. Bacon thinks that his service has done very well; its submarines have covered more than 30,000 miles with their own engines, and have had but three fatal accidents, of which only two may be properly regarded as peculiar to the nature and functions of the submarines, the third being due to an inexcusable violation of a perfectly simple regulation. Hence he reasons that submarine service is not exceptionally dangerous.

Of the two most serious English accidents, the court which investigated the *A8* disaster could find no reason for that boat's fatal dive to the bottom. The *A1* was sunk because water entered the boat after she was struck by a steamer, and this overcame the reserve of buoyancy which in this Holland type of boat seems to be altogether too small. The *A8* might have been saved had it been possible to close her hatch in time as she plunged. The entrance of water was also the reason for the loss of the French boat *Farfadet*, and of the Russian *Delfin*, which went down in the Baltic. It is not generally known that the American submarine *Porpoise* dove 120 feet to the bottom on the admission of water into her hull, and was almost miraculously saved from the fate of the *Farfadet*. These experiences may have led Rear-Admiral Melville to go on record to the effect that "the diving principle is wrong for a submarine boat. With such a form of construction you destroy longitudinal stability." Rear-Admiral O'Neil was quick to see that the admission of even a little water would overcome the small margin of reserve buoyancy. Collision, Capt. Bacon points out, ought to be avoided at any cost, because of inevitable leaks. In the case of the *A1*, the water found its way in under the conning tower, which will probably not occur again, owing to the adoption of a water-tight hatch at the base of the tower. In this English expert's opinion there is no excuse whatsoever for gasolene explosions. As to salvage operations, Capt. Bacon finds it not at all difficult to recover a boat sunk at a moderate depth; but to get her up in time to save the crew is another matter. This difficulty has led to the serious suggestion in Washington that our future submarines be built with strong eyelets at bow and stern, into which hooks could be placed by divers, thus permitting a derrick to lift the boat to the surface.

But even this arrangement presupposes the presence of divers and derrick. The builders of the Lake submersible boat claim that their boats do not need either. An advocate of this "submersible"—as opposed to the submarine or diving craft—makes in a letter to an English naval officer, recently published in the *Army and Navy Journal*, some very interesting statements about the relative safety of the two types. This anonymous expert, who has taken many dives in Holland boats, has always noticed a downward bow pull that increases with the speed and the depth of submergence. He does not think it possible to construct a diving boat which can be driven at a high rate when near the surface, on account of the difficulty of controlling it in a vertical plane. He explains that the submarine submerges by overcoming nearly all buoyancy through filling water ballast tanks until the centres of buoyancy and gravity are close together. When the boat is sufficiently "down by the head," she is forcibly submerged by going ahead under an electric motor and by means of a special horizontal diving-rudder gear. To control this properly and to keep the water-ballast tanks nicely adjusted requires expert skill.

According to its owners' claim, the Lake submarine sinks on an even keel through symmetrically disposed hydroplanes and great longitudinal stability. Moreover, it is asserted that, in the event of an accidental submergence owing to negative buoyancy, a drop keel can be released, and the craft thus brought to the surface automatically. Should this contrivance fail, the crew can at least escape through the diving chamber, which is watertight, and can be opened only from inside the boat when it is closed on the outside. Finally, the Lake boat appears still safer because it carries its gasolene in a superstructure isolated from the inner hull, in which have occurred the explosions, which Capt. Bacon thinks unnecessary, in boats of the other type. We have already pointed out that the French naval authorities, the leaders in underwater work, have definitely abandoned the submarine in favor of the submersible. We have not yet been able to find out, however, why the Lake boat so eagerly snapped up abroad never could get from our own naval authorities an adequate test. A board of American army officers has pronounced it the "nearest approach to absolute perfection known." But Congress or our naval authorities stick to the less safe type—a fact more striking in view of the Holland boat scandal in Congress of two years ago.

GERMANY AND ENGLAND.

The friends of peace in both England and Germany—which means also the friends of humanity, of education, of research, of progressive civilization—have awakened, none too early, to the need of counteracting the men and agencies that would embroil the two countries. There has been something like a propaganda of war on both sides. The *National Review*, for reasons of its own, has been for months harping on Germany as the one malignant enemy of England; while the London *Times* and the *Morning Post* and lesser Tory newspapers have given too frequent expression to the same idea. In Germany, of course, there have not been wanting army Hotspurs to give the English as good as they sent, in the way of threats, while a part of the press has equalled the English journals referred to in petty misrepresentation and nagging. Bad feeling was steadily being heightened by these tactics, and it was time that serious minds in either nation should set about showing what were their real sentiments.

Mr. Bryce's public statement on the subject last week must have a marked effect in both countries. He spoke not merely for himself. His deliberate utterance was made only after consultation with leading public men in both parties, and with others who stand for what is best in Great Britain; and he solemnly assured German inquirers that no English politician of standing, no leader in any department of English thought, had the slightest idea of a war with Germany, or could contemplate its

advocacy by reckless writers with anything but abhorrence and dismay. Such a voice must carry far.

On their side, enlightened Germans have been doing their part to frustrate the mischief-makers. After his visit to England last year, Professor Paulsen wrote an article in the *Rundschau*, deprecating the rash words too freely used in the press of either empire, and breathing the heartiest good will and most ardent love of peace. He was, of course, well fitted to speak for the learned world of Germany. Even more significant, however, is a paper by Professor Delbrück in the August number of the *Preussische Jahrbücher*. Delbrück is precisely one of those professors whom the English Teutophobes have accused of wishing to "educate" Germany up to the point of attacking England. But what does the implacable enemy say? Why, that an Anglo-German war could have but one issue—"ruin for victor and vanquished alike." He goes on: "I venture to say that the greatest misfortune that could befall Germany, next to a defeat in a war with England, would be a victory over England—indeed, one might say that a victory over England would be a still greater misfortune for us than a defeat." His reason is that all other countries would at once unite against Germany. He roundly affirms:

"Nothing is more false than to suppose that amongst German well-educated people and at the German universities real hostility against England is nurtured, as is declared far and wide to be the case by the harrying press in England, and, as I have heard from English friends, is in reality believed in England. Expressions about this alleged hostility that are repeated in England are in great part misrepresentations or pure and simple untruths, which the English press refuses to rectify."

Taking up the specific allegation that Germany is now aiming at "the supremacy of the North Sea," Professor Delbrück disposes of it in (as it must seem to the English Jingoes) the most heartless fashion. There can be no such thing, he affirms. Supremacy in the North Sea is, strategically, only a part of supremacy in the Atlantic Ocean. The latter, England unquestionably has. Germany could not hope to dispute it now, or for many years to come. Hence the cry of endangered supremacy in the North Sea is simply an artful diversion on the part of the *National Review*. It knows that none of its readers would believe it if it said that the Germans were preparing to beat the English at sea, so it limits the peril to the North Sea, where the Emperor is to build "special fleets," etc. But Delbrück tears the straw out of that bogey. Supremacy at sea means supremacy in all parts of the sea.

After the recent meeting of the Society of Friends at Leeds, a public letter was sent to the "Friedensfreunde" in Germany. In it there was the strongest repudiation of the efforts of "certain politicians and editors, in your country as well as ours, to sow the seeds of distrust between us." Not simply as Quakers, but as citizens, the Society desire to give Germans the most solemn assurance that, no matter what irresponsible writers or speakers might say, anything like an unprovoked attack upon Germany by England was absolutely impossible. These statements were commented upon in a friendly spirit by the German press; the *Norddeutsche Allgemeine Zeitung* remarking that all such advances would be hailed in Germany with outspoken satisfaction. Evidently, it is just as easy to call out international good feeling as craftily to provoke international enmities.

Let it not be imagined, however, that all this will have any effect upon the Jingoes, except to exasperate them. What do they care for mere professors? How much respect have they for the exponents of religious sentiment? With Hamlet, they regard all thoughts that are not bloody as nothing worth. They are the only true patriots. In them alone resides the gift of far-sightedness. All the secrets of strategy and world-policy are locked up in their capacious brains. So they will doubtless go on as before. It is one of the terrible things about those who plot and plan for war that they snap their fingers at the men whom, in all other provinces of life, the nation would be disposed to follow. The Bryces, the Delbrücks—why, any naval lieutenant big with "strategy," or the most insignificant wielder of the journalistic "we," is entitled to brush aside their opinions, their advice, their warnings, as of no account. But the demonstration has been made. If anything were needed to accentuate the madness of a war between Germany and England it would be the clear proof which we now have that the thinkers, the scholars, the real publicists of both nations regard the causes of difference and friction as infinitesimal, compared with the reasons for a hearty and fruitful friendship.

THE ALIENS ACT.

LONDON, August 9, 1905.

The Aliens Bill will seemingly, by the time this letter reaches New York, have become the Aliens Act, 1905. No measure of less immediate importance but of more significance as a sign of the times, has ever been passed by the Imperial Parliament. It is the outward manifestation of a new spirit; it is the outcome of a widespread belief, the strength of which is proved not more by the action of the Government than by the inaction or acquiescence of the Opposition, that some check ought to be placed on the hitherto unrestricted flow of foreigners into England; and this belief itself is the offspring of changed circumstances and of new sentiments. The time has passed away when both philanthropists and politicians accounted immigrants as accession to the strength of the country. Men already imagine that the world is too small; you may love your neighbors, but you may easily have too much of them, especially if they are paupers. "The fewer the better cheer," is growing into a maxim of popular statecraft. If this is so at the beginning of the twentieth century, how will civilized nations regard the influx of foreigners at the end of the twenty-first, or of the twenty-second century? The inquiry excites painful misgivings. The civilized world is clearly coming face to face with a most serious problem, and one who notes the current of opinion may, without being a pessimist, dread the approach of even an apparent conflict between patriotism and philanthropy. These are not times when any man would readily depart from the traditional maxims of public spirit and humanity; and the Aliens Bill of 1905 marks changes in English policy and opinion which it is difficult to notice without some apprehension.

First, the bill introduces a revolution in the traditional policy of England. This country has hitherto welcomed the arrival of foreign settlers. Whether we may accurately talk of a "right of asylum" is an inquiry of academical interest, fit for the discussion of professorial jurists or for subtle examination by any Minister who is a master of logomachy rather than an effective leader of men. But if we set aside verbal quibbles or refinements, one must admit that all sorts and conditions of men have, for many generations, been allowed to settle in England, and that the children of such settlers have, in virtue of their birth, become subjects of the British Crown, and, as far as descent goes, have been entitled to the full rights and privileges of Englishmen. Nor can any one deny, either, that free immigration has been a benefit to the English people, or that this freedom is curtailed by the Aliens Bill. The measure, therefore, is, in principle at least, a revolution in national policy.

Secondly, the Aliens Bill is, for good or bad, part of a movement for the protection of British industry. The bill is, indeed, supported by many persons who honestly repudiate a protective tariff, but it certainly commends itself to every consistent Protectionist. Mr. Chamberlain's fiscal policy does not enlist my sympathy, but no one can deny to him the possession of several high qualities not often found among modern English statesmen. One of these is the habit of speaking out his mind with reckless clearness. His position with regard to the Aliens Bill has been made as clear as day. He lays little, if any, stress upon many of the objections taken to the free admission of foreigners. He supports the bill because it is a step in the direction of Protection. He argues that if the principle be admitted that the working classes must be protected by law against competition with the labor of underpaid foreign immigrants, the conclusion will soon be drawn that the English workman must be protected from competition with goods made abroad by underpaid foreign laborers. Restraint on free immigration will lead, he conceives, to restraint on free importation; if the interests of English workingmen demand interference with the free immigration of laborers, it

also, holds Mr. Chamberlain, justifies interference with free trade.

Thirdly, the bill, and still more the debates to which the bill has given rise, betray and stimulate some alarming alterations of public opinion. This country still, for example, desires to provide an asylum for political refugees; but sensitive sympathy with the wrongs of exiles fleeing from oppression at home, which fifty years ago was entertained by all classes of Englishmen, and especially by our artisans, has lost much of its intensity. Nor is this change of feeling hard to explain. The modern exile smells too strong of dynamite. Assassination savors more of murder than of warfare, and is an arm used as often against the best as against the worst of rulers. The course of events, too, has increased the sense of international obligation, and the dogma that "crime is local" is now felt to belong to a barbarous age. But a change which may be justified may nevertheless beget new evils. It would be a bad day for England, and for the world, if the mass of the English people became insensible to the presumption in favor of foreigners who resist oppression, or if English workingmen ceased to admire heroes such as Garibaldi. It excites some serious fears to find that when Mr. Atherley Jones, a Radical of the old school, protests against any measure by which political refugees might be excluded from our shores, he still meets, indeed, with some support, but is clearly felt to be speaking the language of a bygone age.

The debates, again, on the bill, combined with other circumstances, raise an uncomfortable suspicion that zeal for religious liberty has waxed somewhat cool. The ardor with which the Liberals of 1830, who had inherited the best ideas of the eighteenth century, preached the doctrine of toleration, had by the middle of the nineteenth century produced the most salutary effects. No class gained more from this popularization of toleration than did the English Jews, and no country was more amply rewarded than was England for the gradual opening of all careers to our Jewish fellow-citizens. Of the violent anti-Semitism which has embittered public and private life throughout the Continent, we have in England, one is thankful to say, known little or nothing. It is impossible, however, not to notice (though the matter is one which an English writer must touch upon with extreme reluctance) symptoms of a slight though ominous change of popular sentiment. Of recent years anti-Semitism has on rare occasions —and only, it is true, in one or two parts of the United Kingdom—led to acts of public and oppressive violence. A disagreeable warning has been given that toleration is a virtue which does not always command popular sympathy, and that the national executive must be prepared, at every moment, to check with instant severity any inroad made by mobs on each man's right to perfect religious freedom. Boycotting takes its most odious form when it is combined with persecution. There is, however, something in the tone of the day which assuredly suggests that the Aliens Bill of 1905 may be found to stimulate sentiments of racial and religious hostility. No doubt the bill does not originate in anti-Semitic fanaticism, but the constant reference to the evil of admitting to England Polish and German Jews has an ugly sound.

The defenders of the measure are perplexed how to deal with this topic. They express, no doubt with sincerity, their abhorrence of religious intolerance. They pay deserved tributes to the lavish and touching generosity with which rich Jews support their poorer co-religionists and prevent the necessity of their applying for parochial relief. Yet apologists for the bill are almost of necessity placed in this dilemma: if the Aliens Bill does not restrict the immigration of German or Polish Jews, it will fail to meet the wishes of such English workmen as desire a change in the present law. If it does restrict the settlement of Jewish aliens who are admittedly supported, or found employment, by English Jews from the moment of their arriving in England, then the intimation, sometimes thrown out, that Jews will not practically come within the operation of the bill, is misleading. In any case, it is very difficult to believe that the measure, even as it stands, will not do something, though one hopes not much, to stimulate or sanction anti-Semitic sentiment among the poorer members of the community. The practical effect of the measure must be very small, but its moral effects may be considerable.

Here we touch on the weakest point of this bill, as of many other proposals now laid before Parliament. As a law it must be ineffective. If it is to attain its end, its provisions must receive vast extensions; but as a precedent and an example it may in the long run have vast and most dubious results. It inaugurates a thorough-going revolution in the traditional policy of the country; it marks a step on the path which leads towards Protection; it may, especially if it becomes the parent of more stringent measures, stimulate a form of religious intolerance which is abhorrent to every liberal-minded Englishman. The English public have not yet mastered the elementary truth that the main importance of laws lies in their effect upon public opinion.

AN OBSERVER.

Correspondence.

VENEZUELA CONCESSIONS.

TO THE EDITOR OF THE NATION:

SIR: In your paper of July 20 you had a notice of the dispute between the Bermudez Company and Venezuela. I was more or less connected with Venezuela from 1853 to 1890; spent much of my active life there; travelled over it from the Atlantic to the Andes, and the Caribbean Sea to the basin of the Essequibo River; knew its people, its politics, and its history. I think it will be found that every contract, or concession, issued from the ministry of "Fomento" (which department has control of all interior development), winds up with a clause to the effect that all disputes as to the operation, or interpretation, of this concession shall be decided by the Supreme Court of the republic, and shall in no wise become the subject of any diplomatic or international interference. I have the exact wording of this clause somewhere among my papers, if it is of interest to you.

Concessions have, I think, invariably been accepted with this agreement, fairly stated, and I do not see how the Government at Washington can take any action—at least, so long as it treats diplomatically with Venezuela as a civilized, independent Power. The remedy lies deeper.

Very respectfully, your obedient servant,

J. B. AUSTIN.

SANTA BARBARA, CAL., August 5, 1905.

HOT BREAD.

TO THE EDITOR OF THE NATION:

SIR: I was born and raised in Vermont, on cold bread. I can remember that even the raised biscuits for the ladies of the Sewing Circle were always allowed to cool before being offered to the guests. I was for several years a sufferer from dyspepsia. Very soon after circumstances had led me into the habit of eating hot bread one or two times a day, I recovered from the dyspepsia. This is a lovely *non-sequitur*, I know; but I don't offer the fact as a serious argument for hot-bread eating, as "P. Q. R." does his mortality figures for the cold-bread habit, in the *Nation* for July 27. I do think, however, that well-made hot bread is very wholesome.

J. C. D.

August 8, 1905.

TO THE EDITOR OF THE NATION:

SIR: In the *Nation* of July 27, 1905, is a letter headed "Hot Bread," in which the question is asked, "whether it is not hot bread that is responsible for the too early taking off of the population of the South?" In the Columbia, Mo., *Herald* for July 28, 1905, this question is asked, "Is it because of hot biscuits or despite hot biscuits that Missourians are born more numerously and die less rapidly than the citizens of other States!" The question comes at the end of a paragraph headed, "Why It Is Better to Live in Missouri," and beginning:

"Hot biscuit is one reason—indeed it is several. Bread is the staff of life. Man may live on toast, crackers, cornbread, crullers, anything into which cereal enters as the chief constituent. Mere living, however, does not satisfy the Missourian. He insists on hot biscuit. Three times a day is his accustomed average, though by the perversity of cooks and because of other reasons he does not always attain the average. The editor of a great Eastern magazine visited the home of a rural Missourian this month. The editor had been born in Maine and brought up—'raised,' in the Missouri vernacular—in Massachusetts. The good housewife thought to please her guest, so beside the usual hot biscuit she placed a plate of light bread—or simply bread, as he called it. It was observed, however, that the editor ate only hot biscuit. 'While I am a New Englander,' he said in explanation, 'my soul loatheth that light bread.'"

Yours truly,

S. T. U.

COLUMBIA, MO., August 5, 1905.

Notes.

The seventh edition of that excellent and most handy compilation, 'The International Directory of Booksellers and Libraries, and Bibliophile's Manual' (Rochdale, Eng.: James Clegg), will be ready for publication in October next. The scope is more comprehensive than the title, as lists of publishers, learned and scientific societies, theological colleges, book-illustrators, and

noms de plume revealed, are supplied. The renewal is prompt, only two years having elapsed since the sixth edition.

With keen delight we welcome a new edition of Mr. Arthur H. Norway's 'Naples, Past and Present' (Methuen & Co.), a work almost beyond praise. Scholarly, trustworthy and beautifully written, learned but never dull, it fulfils and more than fulfils its professed object of serving "not as a guide, but as supplementary to a guide." History, religion, legend, folk-lore, art—nothing is omitted; and so vivid are the descriptions that, as we read, we can almost see the figs blackening in the sunshine, and hear the scent-laden breezes rustling through the myrtle groves. Unquestionably, the next best thing to visiting Naples is to buy this book. So excellent is it that we are strongly tempted not to criticise the one thing criticisable. Truth, however, compels us to remark that the proofreading of the "List of Illustrations" appears to have been very careless. It contains such solecisms as "Porta Capuano," "Strada di Tribunali," and "Vittorio Emmanueli"!—mistakes, be it noted, which find no counterpart in the body of the work. *That* is all which could be desired.

Mr. John Bigelow's 'Life of Benjamin Franklin' (Lippincott) has reached a fifth edition, and is issued as "revised and enriched." Since the first appearance of this entertaining work, distinguished as it was by using the Autobiography for the first time, many new discoveries have been made concerning Franklin's career. As editor of Franklin's writings, Mr. Bigelow enjoyed an unusual opportunity for obtaining items, more or less important, that had escaped the notice of previous editors. Some of this material is embodied in his new edition of the 'Life,' and much has been omitted as unsuited to a running account of the man's career and work. So far as the additions depend upon documentary evidence, they certainly enrich the volumes, and it is a pity that the editor did not confine his attention to such matters. Unfortunately, he prides himself upon a belief that Franklin wrote the speech which has long passed as a composition of Jonathan Shipley, and he regards this as the most important addition to the 'Life.' The evidence he submits is not conclusive, although it is interesting to see how he has used a few sentences in different letters to support his case. There is no good reason for believing that Franklin more than suggested certain points or arguments, and the speech attained too wide a circulation and notoriety to permit the question of authorship to be disputed. Some portraits have been added, and the inclusion of so many letters of Franklin and his friends makes the volumes a storehouse for readers and investigators.

In this connection we note the first issue, by an English publisher, of Franklin's Autobiography, with an account of his later life by William Macdonald (London: Dent). The text is, of course, that used by Bigelow, and the editor seeks to describe Franklin as the "complete citizen—of his city, his country, and the world." The task is superficially done, and is marred by the strong prejudices of the writer. In outward appearance it is the most satisfactory of all editions of the Autobiography.

A new edition of A. K. McClure's 'Our Presidents and How We Make Them' has been published by Harper & Brothers. The illustrations consist of portraits of twenty-five Presidents and of the author, whose politico-journalistic career is well known. The book, with its full record of platforms and votes, is brought down to the present time, and includes the Roosevelt-Parker canvass of 1904. The author's running account of the contest itself, as in other cases, is marked by impartiality. All these summaries, if not very critical in tone, are readable and to the point.

'The Men Who Made the Nation' (Macmillan), by Edwin Erle Sparks, is an outline of United States history from 1760 to 1865 on a new plan. It consists of short biographical sketches of a dozen men about whose lives the events of our history have grouped themselves, beginning with Franklin and ending with Lincoln. These lives are written entertainingly, and illustrated with many reproductions of contemporary prints, sketches, facsimiles, and caricatures. The author has confined himself to political men, most of whom in their time held high office, but his list also includes Horace Greeley, whom, as a journalist, he regards as a maker of that public opinion which was to determine the fate of slavery. A good many pages are given to Robert Morris, "the financier of the Revolution," and, on the whole, thanks to the author's lively style, we get, in a very small compass, a better history than many a historian with a more ambitious method might have produced.

Having already referred to the new and beautiful reprint of 'Purchas His Pilgrimes' (Glasgow: MacLehose; New York: Macmillan), we need say little in announcing the publication of the third and fourth volumes. The narratives embraced by this instalment of the work relate to the East Indies, and contain, besides their record of seafaring experience, a good deal of information about the court of the Great Mogul. The names of Sir Henry Middleton and Nicholas Downton are familiar to all who have examined the early letters of the East India Company, while Sir Thomas Roe's journal has recently been edited for the Hakluyt Society. The writings of these and many other pioneers of Eastern trade or diplomacy who come within the range of 'Purchas' possess a special degree of interest at the present time.

'Memoirs of a Royal Chaplain, 1729-1763' (John Lane) contains a series of letters from Edmund Pyle, D.D., to his friend and former tutor at Cambridge, Dr. Samuel Kerrich, with liberal annotations throughout by the editor, Mr. Albert Hartshorne. Pyle (1702-1776) was an adherent of Bishop Hoadly, who helped him to the chaplaincy about 1740, and to other preferments; he was Archdeacon of York and Prebend of Winchester from 1756. A man of the world and of his time, his interest was in the politics of Church and State: art, science, and literature make little figure in his epistles, and Wesley and Methodism are beneath his notice. He writes with no waste of words, with great frankness, and with pretty full and accurate information, as to a large range of externals; so that the letters are valuable for the display not of a specially elevated or attractive clerical character, but of the facts and feelings of that age from the point of view of a minor ecclesiastical politician. Of jealousies and of "graft" there is a plenty, and of deeper currents little or nothing. "The poor-spirited old man of Lambeth" (Archbishop Potter), he tells us in 1747, had twice asked and been refused audience; "at length he obtained it, but had better been without it," for George II. called him "a man of a little dirty heart," whereat the heart is supposed to have broken. Mr. Hartshorne seems to have the English affairs of the eighteenth century at his fingers' ends, and explains or enlarges whatever his author left scanty or obscure. He also furnishes a short sketch of Pyle, a long one of Kerrich, and an index of twenty pages.

The somewhat undignified title of 'Johnny Reb and Billy Yank' (The Neale Publishing Co.) represents an exceedingly well-written and good-tempered account of experiences in the Confederate ranks during the whole of the civil war. Mr. Alexander Hunter, clearly of admirable social and personal antecedents, was carried away by his impulses (or principles) when a very young student of the University of Virginia, and he did his best, first in the infantry and then in the cavalry, to make it uncomfortable for the Army of the Potomac. That he wasn't killed as well as seriously wounded seems to have been no fault of his own, and his adventures, which covered a wide range, are vividly as well as modestly told. It is a brilliant military autobiography by an intelligent enlisted man; and it would have been better for the Lost Cause had he and more of his equals been commissioned. Mr. Hunter is fairly entitled to his views as to the failure of the Confederacy, and he briefly summarizes the causes thus: Mr. Davis as President and his favorites as generals; the imbecility of the Confederate Congress; the death of Stonewall Jackson; giving Early an independent command; the irrational management of the War Department; the failure to arm the slaves, with freedom as their reward. Per contra, the producing power was not materially depleted for fighting purposes, and, except "President Davis's rows," there was no dissension among the Southern leaders, as was conspicuously the case at the North. Mr. Hunter thinks the Army of Northern Virginia would never have been vanquished had not the United States navy maintained a sealing blockade. The index is far too meagre, and there are many lapses in the proofreading of proper names.

'Southern Writers,' edited by W. P. Trent (Macmillan), is a volume of selections designed primarily for school and college classes in the South. The editor deprecates the inference that it is to be regarded as "a sectional product in the unpleasant sense of that term"; the literature of the South is part of the history of the South, and as the one is studied, so should the other be. The volume is intended to furnish supplementary reading and information which teachers can use in connection with other work. The editor modestly speaks of his task as having proved "not inconsiderable." As he has managed to get into his volume, in addition to the selections, sketches of more than eighty writers and public men (George Washington and Jefferson Davis are both on his list), we should be inclined to apply a stronger term. There are three periods—first, the literature of the Colonies (1607-1789); second, the literature of the Old South (1790-1865); third, the literature of

the New South (1866-1904). Poe is treated as a Southern writer, by virtue of his Maryland ancestry, though he was born in Boston and was not, in any true sense, a local writer. The book is open to the criticism that it tends to foster the provincial illusion that the larger the number of names the greater the repute of the locality. For reference it is valuable, and appears to be well done.

Princeton University has, all these years, been without a guide-book, except so far as a two-volume history, more than twenty years old, may be so regarded. Mr. John Rogers Williams has now supplied this lack in 'The Handbook of Princeton' (The Grafton Press), which in very good taste describes most of the interesting objects and places of patriotic association in that university town of Revolutionary memories. The continuous growth of the great institutions makes it difficult to keep the record strictly in accord with the conditions, but, except in one or two very minor matters, the accounts here given are accurate and sympathetic. The book is fully illustrated for the eye of the absent. The reader might prefer a more copious index, and the writer probably regrets that he, or the Grafton proofreader, allowed the types to speak of Jonathan Edwards as a great physicist (p. 126), when he must have meant metaphysicist.

The series of "Persian Historical Texts," happily inaugurated in 1901 by Dawlatshah's 'Tadhkiratu 'sn-Shu'ara,' or 'Memoirs of the Poets,' published by Professor Browne of Cambridge (Eng.), the general editor of the series, finds a worthy continuation in the 'Tadhkiratu 'l-Awliya,' or 'Memoirs of the Saints,' by Faridu 'd-Din 'Attar, edited by Reynold A. Nicholson, lecturer in Persian in the University of Cambridge. This Iranian mystic of the twelfth and thirteenth centuries is, perhaps, best known by his pantheistic poem of the "Mantiqu 't-Tair," or "Bird-Parliament," edited and translated in French by Garcin de Tassy and abridged in English verse by Edward FitzGerald; but far more important as a history of Persian esoterism is his 'Memoirs of the Saints.' This treatise contains in the majority of the manuscripts seventy-two biographies of eminent Sufis, supplemented by some twenty-five lives of mystics of a later period. The volume under consideration includes forty of these biographies, the remainder being reserved for the second portion of the work. Treatises on Sufi philosophy are only too scarce. The 'Ssufismus' of Tholuck is antiquated, and Palmer's 'Oriental Mysticism' is extremely rare, so that almost the only books accessible are three brief studies by Ethé, a dissertation by Frank, and the chapters by Pizzi and Browne in their histories of Persian literature, while the single Iranian text generally available is Whinfield's edition and translation of Shabistari's 'Gulshan-i-Raz,' or 'Rose-Garden of Mystery.' The present volume, therefore, is a most valuable contribution to our knowledge of one of the chief systems of Oriental mysticism. It is much to be hoped that the series, which is admirably printed in the Beirut type, will ultimately include some of the more modern "tadhakir," such as the 'Haft Iqlim' or the 'Atash Kadah.' Al. lovers of Oriental literature will wish the series success.

Volumes xxiii. and xxiv. of the New Jersey Archives (First Series) are respectively a calendar of New Jersey wills and kindred papers, recorded or unrecorded (1670-1730), and preserved at Trenton; and a further body of extracts from newspapers chiefly of New York and Philadelphia, touching New Jersey affairs (1672-1765). The volume of abstracts of wills possesses much value from a personal and genealogical point of view, and has prefixed an elaborate introduction by Mr. William Nelson, corresponding secretary of the New Jersey Historical Society. It is thoroughly indexed, as is also volume xxiv., which even more strikingly embodies the social customs and conditions of the period. Here we see the foreign slave trade in active operation, with landings and sales on the Delaware. And an advertisement of such a sale of fresh importations in May, 1762, contains this notice: "It is generally allowed that the Gambia slaves are much more robust and tractable than any other slaves from the Coast of Guinea, and more capable of undergoing the severity of the winter seasons in the North American Colonies; which occasions their being vastly more esteemed and coveted in this province and those to the Northward than any other slaves whatsoever."

Nothing is more striking in volume x. of the sixth edition of 'Meyer's Grosses Konversations-Lexikon' (Leipzig: Bibliographisches Institut; New York: Lemcke & Buechner) than the increased space accorded to Japan. As compared with Italy, which gets 44 pages (inclusive of 12 on the literature), Japan has 25 (with 5 of these devoted to literature and art); and the Russo-Japanese war is still to be treated in its own alphabetical place. In the fourth edition of Meyer, 1887, the respective spaces were: Italy, 52; Japan, 16. There is no pro-Russian bias visible in the statement of the relations of the two countries antecedent to the war. There is an unusually attractive collection of maps. The article on Canalization calls for one of the Kaiser-Wilhelm Canal, and the map of Kiel and its harbor shows the eastern end of this national waterway, while a general map records the whole German system. Under Cameroon and the Cape, African interests are catered to; Japan and Russia touch in maps of the island Empire and of the Caucasus, while Germany's intervening hand appears in Kiaochau Bay and the city of Tsinglau. Italy calls for diverse maps. Cairo and Jerusalem along with Karlsruhe and Carinthia are cartographically depicted. Finally, some delicately colored plates illustrate the article on Ceramics.

Pari passu with the foregoing and from the same publishers proceeds 'Meyer's Hand-Atlas,' with parts 13-18. Maps of North America, of the Dominion, of the United States in two sections, and of the Philippines occur, among others, in this instalment; and one of Sweden and Norway, with Denmark, has a timely interest. Add a map of Japan, and one of London and its suburbs, from Harrow to Barking and from Bromley to Tottenham.

Attention should be called to a delightful résumé to be found in a recent issue of *Science* of the argument against the theory of evolution. The writer in *Science* has taken the trouble to reduce to exact form this counter-position as it exists in the mind of a professor in the Drew Theological Seminary, as set forth by him in a recent article, and as usually taught, doubtless, in that institution and others of the same class. It is a masterpiece of delicious unreason, and should be preserved, by those who are interested in logic, as a specimen of the lengths to which human inconsecutiveness can go.

The July number of the *Mayflower Descendant* (Boston) records the speedy appearance, with Houghton, Mifflin & Co.'s imprint, of Mr. Morton Dexter's work, 'The England and Holland of the Pilgrims,' which was originally undertaken by the late Rev. Henry M. Dexter, was completed by Prof. F. B. Dexter of Yale, and has been rewritten by the present editor. He, by the way, has had a hand in photographing, copying, and translating the *Mayflower* marriage records at Leyden and Amsterdam. One may see in this July number the Dutch script of the record for Degory Priest and Isaac Allerton, with printed text and English version. Six others will follow, one monthly.

The first number of a German journal devoted to the study of modern English words, entitled *Bausteine*, has just been received. The editors are Leon Kellner and Gustav Krüger, and the enterprise has the support of the Neuphilologischer Verein of Vienna. According to the plan announced a year ago, the scope of the journal includes the following divisions: long articles on the vocabulary of single writers and of separate departments of knowledge and on the use of separate words, the explanation of difficult passages in English books, a bibliography (in charge of Dr. Brotanek), reviews, and book notices, and, finally, a department of questions and answers. The principal articles in the first number, both in German, are by Dr. Kellner on "Suggest, Suggestive, Suggestions," and by Helene Richter on "Chatterton's Rowley-Sprache." The first impression of the new journal is decidedly favorable: the treatment is scientific, the proofreading (a matter of special importance in a journal of this kind) is careful, few errors having been noted, and the mechanical execution is excellent. English readers will rejoice over the use of Roman script, and all students will heartily endorse the index which will be included in the final *Heft* each year. The subscription for the six parts that will form the year's issue is 18 marks, and the publishers are the Langenscheidtsche Verlagsbuchhandlung of Berlin.

In the annual report of the Essex Institute (Salem, Mass.) for the year ending May 1, 1905, we read of the acquisition of a copy of Hawthorne's 'Fanshawe,' a great rarity, and an autograph letter by the same writer—oddly enough the first to come into the Institute's possession. More important is the announcement of the actual printing of an index to the first 40 volumes of the Institute's Historical Collections, and that the initial volume of the Rev. William Bentley's Diary, filling 550 pages, is in the hands of the printer. This thesaurus has long been known to antiquaries. It is the product of a mind at once full of book learning and interested in a great variety of subjects for observation and study. It extends from the close of the Revolution to Dr. Bentley's death in 1819, and is for Salem a sort of family Bible. His eccentric character is pictorially portrayed in the July

number of the Institute's Historical Collections, as well as by reprints of Judge Waters's historical East Church address in 1868 and of the remarkably graphic and humorous address of Miss Marguerite Dalrymple, given from memory without notes in 1897, when this lady was in her eighty-seventh year.

The British Museum was visited in 1904, according to the annual blue-book just issued, by nearly a million people, of whom 226,323 were students. Among the more important additions to the Library were sixty-seven English books printed before the year 1640; and to the series of incunabula, or books printed before 1510, fifty-eight foreign examples. Among the noticeable accessions to the manuscripts is Philip Massinger's drama "Believe as You List," written throughout in the author's own hand; almost the only extant holograph drama by any of the great Elizabethan writers. Add the autograph of Keats's "Hyperion," already published in facsimile. Other autographs of historic interest are "Memorandum, by Lord Wellington, on the Campaign in the Peninsula in 1811, drawn up for the English Government at the end of the year, and written wholly in his own hand," and "Letter of Benjamin Franklin to P. Collinson on the advantage of free trade."

The meeting of the British Association at Cape Town and Johannesburg, the third held outside of the mother country in the more than seventy years of its existence, promises greatly to advance our knowledge of South Africa, as the majority of papers and addresses will present scientific subjects from the South African point of view. Prof. G. H. Darwin, in his presidential address, proposes to consider evolution in the world of matter as distinct from the world of life. Sir William Crookes is expected to lecture on diamonds, Dr. Haddon on the anthropology of the country, Col. Bruce on the causation and prevention of stock diseases as well as on the sleeping sickness; others upon the evolution of gold production, the geologic history of the Victoria Falls of the Zambesi, etc. At the joint meeting of the geologic and geographic sections Prof. W. M. Davis of Harvard is expected to take part. Not least interesting or useful will be the work of the educational section, which, though of recent institution, is already firmly established. The president, Sir Richard Jebb, will show the growing importance of university education as a factor in the life and development of the nation, with special reference to the conditions which exist in South Africa. Other subjects are rural education as applied to colonial life, the higher education of women, and the important question of native education. The burning question of the day in Johannesburg does not seem to be approached except in two papers on the life history of colored laborers in the Transvaal. We must not omit to record among the distinguished company bound for the Cape Dr. J. A. H. Murray, chief of the Oxford English Dictionary, who, not without a wrench, we must believe, thus takes his first real holiday in a quarter of a century.

—The Library Board of the Virginia State Library has done well in publishing the 'Journals of the House of Burgesses of Virginia, 1773-1776, including the records of the Committee of Correspondence.' This is an admirable beginning of a plan that contemplates a full issue of as many of the Journal records as can be found, and will prove a most valuable addition to the legislative and personal history of Virginia. Many documents and proclamations are used to illustrate the general course of events, and a full index makes the record easily available for the investigator. The editor, John Pendleton Kennedy, State Librarian, has performed his task with judgment, and the result is highly creditable to the State. The original publications are very rare. Mr. Kennedy tells us in his preface that there are copies of the Journal of 1773 in the Library of Congress and in that of the Massachusetts Historical Society; of the Journal of 1774, an imperfect copy is in the Library of Congress; "the Journal of 1775 was never printed in full," and of the epitome in pamphlet form copies are in the British Museum and in the Library of Congress. No session of the House of Burgesses was held in 1776, though two attempts were made to obtain a quorum. Hence the five hundred copies of the volume now printed make these Journals for the first time accessible to the general public. The minutes of the Committee of Correspondence, with the letters received by this Committee, follow directly the Journals for the years 1773, 1774, and 1775, respectively; but they are not entirely complete. These minutes and letters have been printed in the Calendar of Virginia State Papers, volume viii. (Richmond), 1890, under the authority and direction of the then Secretary of the Commonwealth and State Librarian, and it contains letters from Alexandria, Dumfries, Williamsburg, Fredericksburg, and Baltimore not found in the volume of Journals.

—Mr. Kennedy quotes in his preface the noteworthy resolutions of the House of Burgesses of March 12, 1773, offered in Committee of the Whole by Dabney Carr (as Jefferson informs us), and reported to the House by Richard Bland, chairman of the Committee of the Whole, appointing the first Committee of Correspondence and Inquiry appointed by any colony for "correspondence and communication with our sister colonies." Mr. Kennedy reproduces, also, from a broadside in the Library of Congress, the important association entered into by eighty-nine members of the House of Burgesses and others against the use of tea and other East India commodities, except "saltpetre and spices," on May 27, 1774, and suggesting a general congress; this document will also be found in both Wirt's and Henry's 'Life of Patrick Henry.' He omits, however, from the preface and from the minutes of the Committee of Correspondence the important action taken by "25 of the late Representatives legally assembled by the moderator" on Monday, May 30, 1774, after the dissolution of the House by Lord Dunmore. This is given in the Calendar of Virginia State Papers, volume viii. (pp. 52, 53), and is referred to in the letters written next day to the Committees of Correspondence of North Carolina and of Maryland. Besides other action, this meeting called "the late Representatives" to meet on August 1, which convention (that is, the House of Burgesses under another name) appointed delegates to the first Continental Congress, and adopted both non-importation and non-exportation agreements after a time specified. The Journals of the House of Burgesses end with the meeting of June 24, 1775. Their virtual continuation is found in the Journals of the Virginia Conventions of July and December, 1775, and May, 1776. The volume is beautifully printed by the Colonial Press of Richmond, and with it is supplied an enlarged print of the coat-of-arms of the Colony, with the ancient motto "En dat Virginia quartam," and beneath a view of the Virginia Council Chamber. A photolithographic facsimile of the last three entries precedes the title-page.

—The essential character of war is vividly brought out in Richard Barry's 'Port Arthur: A Monster Heroism' (Moffat, Yard & Co.), the sum of his observation as a correspondent during a considerable part of the siege. The wonderful, almost suicidal, feats of courage, inspired by patriotic duty, which transform a people whose daily life, even in camp, is one of gentleness and serenity, divides his attention with the physical suffering that springs from the state of war. The very latest and most effective appliances for destroying life were in deadly operation for months on that tongue of land, and thousands upon thousands were killed and wounded. "Wounded" loses its significance where the meaning of war is not comprehended by personal observation. Frequently, as before Port Arthur, to be wounded implies far more than temporary incapacity or, indeed, the loss of a limb. For many, happily not for the majority, but still for hundreds, it meant to lie on the field between hostile fires, with no possibility of relief, until slow destruction under a torrid sun or in bitter cold ended life. The Russian slopes were strewn with forms riddled with bullets and mangled by shell, many impossible alike of rescue in life or burial in death, and along parts of the lines the living were in the closest proximity to the putrefying corpses. The killed were happier than such wounded. The Japanese army, to which Mr. Barry was accredited, won from him the highest and most sympathetic regard. The sentinel who had rebuffed him under a misapprehension, would not be pacified until he had accepted tea and a cigarette in token of forgiveness. Gen. Kodoma, the Chief of the General Staff, granted him a happy interview. Gen. Nogi, commanding before Port Arthur, extended frequent courtesies. Mr. Barry seems to have received what he fully reciprocated, hearty good will. An army without a guardhouse, officers and men alike without profanity, regiments equally zealous, whether drawing by hand the most enormous ordnance taken into the field, "playing at children's games to the chamber music of women, as gentle as girls," or transformed into demigods of war, are his constant admiration. "You should see them fight!" is one of his exclamations when description fails. He seems to have fully appreciated the decision of the General Staff, that correspondents may have privileges but have no rights, and, acting on that doctrine, he took full advantage of the situation. Not strictly a well-written book, this is nevertheless full of the vitality of the field, and the impression that it gives of a record made on the spot is heightened by the numerous illustrations from the author's own camera.

—The series of "Temple Biographies" (Dutton) has for its latest volume 'Thomas Harrison, Regicide and Major-General,' by Mr. C. O. Simpkinson of Balliol College. During the past three or four years considerable interest has been shown by English historians in the Fifth Monarchy men, and particularly in their uncompromising leader. Mr. Dugald Macfayden, the general editor of this series, goes farther than any other modern when he says of Harrison's followers: "It is due to them to recognize that they held, with zeal which shames our listlessness, an ideal which for purity and splendor is, when compared with those for which our generation gives its strength, as a Matterhorn among mole-hills." Such language, we submit, is not near enough the truth even to be passable rhetoric; but, all extravagance of preface-writing aside, it is well for an age which willingly admits the strength of Cromwell's character, to understand the nature of his relations with colleagues like Rainsbrough, Harrison, and Powell. Long before Robespierre sought to bring in the reign of reason and universal benevolence by the guillotine, the Fifth Monarchy men had demanded the execution of Charles I., because his life stood between them and the attainment of their desire to establish God's kingdom on earth. One interesting feature in the programme of these extreme Radicals is that they would have disfranchised the ordinary Christian altogether, choosing their parliament from the ranks of the godly, and thus placing ultimate power in the hands of those who had been "gathered" into a select pale. The distinction between Church and World, always in the forefront of Christian thought, has never been drawn more tightly than it was in England between 1647 and 1655. That Cromwell suffered himself to be driven towards regicide by the left wing of the Independents is hardly less certain than that, on becoming convinced of their wrongheadedness, he used his might to break down their organization. In Harrison himself is found a singular combination of traits. He certainly impressed many of the hard-headed among his contemporaries as being a man of piety and real enthusiasm for the lofty ideals which he professed. Yet he had a craving for pomp and display, laid his hands on money with the promptness of a ward politician, and was not particularly scrupulous as a party manager. His credentials to fame and influence were activity, great personal courage, and the possession of a clearly outlined policy. No one else was so active in bringing Charles I. to the block, and, as the chief regicide, he was honored by the special hatred of the Royalists. It does not require a literary education, which Harrison lacked, to save a man of shrewd sense from running into a vagary like that of the Fifth Monarchy programme, and the leaders of this sect seem to us disqualified by their lack of mental balance from holding a high place among the irreconcilables of history. But their presence in the England of the Great Rebellion furnishes a useful standard by which to measure the development of radical thought under revolutionary influences, and the personal virtue of firmness saves from contempt the most impossible of their projects. Mr. Simpkinson's 'Life of Harrison' is scholarly and sympathetic, without being marred by the parade of extenuation.

—M. N. E. Dionne's 'Champlain' in the "Makers of Canada" series (Toronto: Morang) is a highly eulogistic life of the great explorer and colonizer. French Canada honors the founder of Quebec as it honors no one else among the laymen of the seventeenth century, and this reverence, at once natural and creditable, gives its chief color to the present memoir. Among all the pioneers, none is more respectable than Champlain. He was not only religious, but moral, and the Hurons, long after his death, looked back to his personal habits as constituting a standard of rectitude and decency. For M. Dionne, Champlain is also a champion of the faith, the convinced ally of Jesuit missionaries, and one who had determined that the French part of the New World should be untainted by heresy. In his striking panegyric of the art of navigation, Champlain himself said: "This is the art which won my love in my early years, and induced me to expose myself almost all of my life to the impetuous waves of the ocean, and led me to explore the coasts of a portion of America, especially those of New France, where I have always desired to see the lily flourish, together with the only religion, Catholic, Apostolic, and Roman." This passage, emphasized by the erection of Notre Dame de la Recouvrance, will suffice to explain why French Canada looks upon Champlain as far more than a mere navigator and writer of voyages. For material, M. Dionne has gone chiefly to Champlain's own writings and to the reports of the missionaries. Designed as a contribution to a popular series, we do not meet in this book with any long discussion of disputed or technical points; but M. Dionne takes time to consider large issues such as the expediency of Champlain's attack upon the Iroquois, and is not prevented from breaking a lance at intervals with Faillon. For us the most interesting portion of the narrative is concerned with the taking of Quebec by the English in 1629. M. Dionne, who is a special authority on matters relating to the local annals of Quebec, furnishes some pointed details concerning the situation which existed when the town surrendered. "The population of the whole colony in July, 1629, was divided as follows: inhabitants, 23; interpreters, 11; clerks, 14; missionaries, 10; domestics, 7; French, arrived from the Huron country, 20. . . . Since the year 1608 there had been only seven births, three marriages, and forty deaths. One man had been hanged, six had been murdered, and three drowned." Into the subject of Champlain's voyages we are unable to enter, nor can we recapitulate his services to the New World; but these and all cognate topics are dealt with by M. Dionne with both sympathy and information.

—Another aid to teachers and students of English constitutional history is furnished by the 'Select Statutes, Cases and Documents' which Mr. C. Grant Robertson has recently brought together (Putnams). This sort of compilation was begun many years ago by Stubbs in his 'Select Charters,' and has been carried forward past the mediæval period by Professor Prothero and the late S. R. Gardiner. Mr. Robertson's volume, which has grown out of his own lectures on Constitutional History at Oxford, begins at the Restoration and comes down to the first Reform Bill. Among existing works, the one with which it comes into closest comparison is the 'Select Documents' edited by Prof. G. B. Adams and H. M. Stephens. The concluding portion of the latter work covers the same ground which is covered by the first part of Mr. Robertson's book, where documents like the Act of Uniformity, the Test Act, the Act of Union with Scotland, and other measures of similar importance are printed. There is less abridgment in the present work than in Adams and Stephens, while a totally new feature comes in with the section devoted to cases like the Trial of the Seven Bishops, the impeachment of Sacheverell, the case of Sir Francis Burdett, and Stockdale *v.* Hansard. Altogether, thirty-two of these cases, beginning with Skinner *v.* the East India Company (1666) and closing with Bradlaugh *v.* Gossett (1884), are given. Besides the documents which are printed at full length, others relating to the period since 1832 are included under the form of an abstract—for example, the Municipal Corporations' Act of 1835, the County Councils' Act of 1836, and the Parish Councils' Act of 1894. Mr. Robertson adds very few notes of his own, and such as he supplies are brief; but as the book will chiefly be used by teachers in close conjuncture with their own lectures, the paucity of comment does not call for adverse criticism. The most novel feature in a collection of this kind is the introduction of legal cases. "No apology, I take it," says Mr. Robertson, "to-day is necessary for allotting in a volume of this kind . . . a considerable place to cases in constitutional law. The part played by the law courts in defining, extending, limiting, even creating constitutional law, machinery, and rights, is explained and justified in the leading authorities, and the argument need not be repeated. Certainly a student who had studied the period in question and was ignorant of the leading cases would have a very partial, unsatisfactory, and misleading knowledge of his subject, both as regards historical and philosophical principles and historical matters of fact." With this view we heartily agree, and are glad to see reports of the leading constitutional cases included in this useful repertory of documents.

THE ADMINISTRATION OF TROPICAL DEPENDENCIES.

The Far-Eastern Tropics: Studies in the Administration of Tropical Dependencies. By Alleyne Ireland, F. R. G. S. Boston: Houghton, Mifflin & Co. 1905.

The interest of the American people in the Philippine Islands has much declined since 1898, when patriots of the spread-eagle type were rejoicing that the United States was at last about to emulate the European monarchies in becoming a Power colonizing and ruling beyond her own limits, and when not a few philanthropists and clergymen were assuring us that the right way to deal with domestic difficulties—the right way, for instance, to reform corrupt city governments—was to assume new national responsibilities which would so stir the spirit of the nation as to bring about an improvement in

every sphere of public activity. But though this interest has declined, though these happy results have not yet revealed themselves, though the ordinary citizen thinks little about his tropical subjects on the far side of the Pacific Ocean, still the fact remains that the United States is responsible for the Philippines, and sees no present prospect of escaping from that responsibility. It becomes, therefore, a matter of practical urgency to know how to deal with the islands; and all the light which competent observers can throw upon the problem ought to be gladly welcomed. It ought to be welcomed all the more when it comes from a writer who stands outside United States politics, and cannot be suspected of manipulating facts or suggesting arguments in favor of or against what is called an Expansionist policy.

The book before us makes a contribution to the solution of this problem which has the merit of being unconnected with party politics, and which has the further advantage of being concise—so concise that readers who would be repelled by a fuller and more elaborate treatment may find time to peruse it. Mr. Alleyne Ireland tells us in his preface that he is "a British subject, who was in 1901 appointed Colonial Commissioner of the University of Chicago for the purpose of visiting the Far East and preparing a comprehensive report on colonial administration in South Eastern Asia." This report is to be a very large affair. It is now being prepared, and will be published in America during the next four years. Meantime Mr. Ireland gives us, in this volume of 426 pages, a sort of preliminary survey of the field which his large treatise is to cover. It is written in a broad and popular way, being a reprint of a series of articles which appeared in the London *Times* and of another series which appeared in the (New York) *Outlook;* and is a group of brief "studies of various phases of British, American, French, and Dutch colonial administration and policy." Beginning with Hongkong, British North Borneo, Sarawak, Burma, the Federated Malay States, and the Straits Settlements, all of which are British, he proceeds to French Indo-China and Dutch Java, winding up with four chapters on the Philippine Islands. Statistics, bibliography, and tables from the recent Philippine Census find a place in the three appendices.

Mr. Ireland is an effective writer, clear, vigorous, and direct, putting his points in a broad way; and though he has the summary manner of the journalist, with some carelessness and laxity in the use of words, he is free from most of the faults one is apt to find in a journalistic treatment of large and difficult subjects. He belongs to the school which some would call anti-sentimental, or even anti-humanitarian, but which he would no doubt describe as being the school which sees facts as they are, and considers that native races must be improved and native territories developed in the interests of the world at large, with slight regard to the wishes of the natives themselves. This point of view, however, which is often presented with brutal frankness by those who desire to hurry on the process of exploiting tropical territories, is not offensively obtruded in these pages, which may be read with pleasure as well as with interest by those who desire to find in small compass an outline of the experiments tried by four different nations (in what is almost the same kind of work) in the various regions we have already mentioned.

It is impossible to summarize here the descriptions given of the various methods of administration that have been adopted in these regions, or even to show how the three problems most constantly recurring have been dealt with. These problems are that of securing a revenue sufficient to pay for the internal development of the country by public works; that of using natives for administrative purposes under the control and supervision of Europeans; and that of finding a due supply of labor for agricultural and mining operations. That Mr. Ireland judges the English to have been most frequently successful in handling these and other matters, need not be attributed to any partiality for his own countrymen. The English have had far more experience in colonial administration than any other people. They have had Indian dominions for a century and a half, West Indian dominions for an even longer period, and East Asiatic dominions for a century. It is true that the Dutch acquired territories in Java before the English possessed any tropical territories, but the sphere of Dutch action has been far less wide. Spain had a longer experience and a more extended one than either of these Teutonic nations; but as Spain was almost uniformly unsuccessful either in raising her subjects or in acquiring their loyalty, or in making the most of her dominions for economic purposes, and as her colonial career has now been closed, there is little except warning to be drawn from the record of her conquests and her failures. France has, according to Mr. Ireland, turned over a new leaf in Indo-China, and is now governing her possessions there is so efficient a way that they are rapidly gaining prosperity and have become self-supporting. This, however, is an affair of the last few years. The examples which it is really instructive for America to study are those afforded by England and by Holland. Of these, those best worth studying because they present most resemblance to the conditions existing in the Philippine Islands, are the Federated Malay States, British North Borneo, the principality of Sarawak, and Java.

British North Borneo is a territory with a population of about 175,000 persons, nearly all uncivilized natives, though there are a few Europeans and more than 12,000 Chinese scattered over 31,000 square miles. It is worked under a charter by a British trading company under British protection, with a power reserved to the British Government to require the abandonment of any part of the proceedings or system of the company which they disapprove, and with a prohibition of any trading monopoly. Otherwise the company is autocratic. There is a governor, appointed with the approval of the British Government, who rules the country through officials, the higher among whom are of course Europeans. Native chiefs are permitted to remain and to deal with their subjects, under the supervision of the officials. The country seems to be peaceful, and the people contented, for their customs have not been disturbed and they are secured against gross injustice and oppression. But the company has, in Mr. Ireland's opinion, not done enough to develop the resources of the country. It does not trade, but tries to pay a dividend to its shareholders out of taxation, and revenue will not be elastic until much more has been done to open up communications and to bring in industrious immigrants from China or Japan. His view is that the company had better have itself entered upon commercial enterprises, and that it has failed to make the most of the country because it has been constantly hoping to sell out to the British Government, as the Niger Company did some years ago, upon terms advantageous to the shareholders.

The Federated Malay States consist of some native principalities on the Malay peninsula, behind the (British) Straits Settlements. They are a British protectorate, but one far more directly controlled by the home Government than is North Borneo. The British Government, which possessed colonies hard by in the Straits Settlements, was led by the disorders and misrule which existed in these independent Malay States, and especially by the need for repressing piracy, to extend its influence over them by placing residents at the courts of the native Rajahs. This process began in 1874, and now these States, with an area of 26,300 square miles and a population of 800,000, are practically ruled by the British residents, under the direction of a resident-general.

"Each State is governed by a State Council composed of the Sultan, the British resident [who is virtually master of the situation], the secretary to the resident, a number of Malay chiefs, and one or more prominent Chinamen to represent the interests of the Chinese community. As the members of the Council hold their seats by appointment and not by election, and as no law is submitted to the Council for enactment until it has been approved by the Governor of the Straits Settlements and the Colonial Secretary in England, there is here no greater independence of legislation than is enjoyed in a British Crown colony" (p. 118).

Mr. Ireland goes on to speak in warm terms of the excellence of the small British staff which practically administers these principalities, while interfering hardly at all with the social customs or the religion of the people, or the position of the native nobility, and he adds:

"British rule has given the native in the Malay States security for life and property; it has abolished slavery and the exaction of unpaid labor; it has provided free education and free hospital treatment and medicine for all; it has established permanent land titles; it has exterminated piracy; it has put an end to the recurrent scourges of smallpox and cholera; it has constructed over a thousand miles of metalled road; it has built *out of current revenue* three hundred thousand miles of railway, which carried nearly four million passengers in 1902, and earned in ten years a revenue of over $7,000,000; it has (perhaps unwisely) left the native practically untaxed (raising revenue mainly from an export duty on the tin extracted by Chinese miners and from opium, spirit and gambling licenses paid by Chinese); it has raised the revenue of the States from $400,000 in 1875, to $22,500,000 in 1902; it has in the same time increased the foreign trade of the States from $1,500,000 to $127,000,000; it has kept the peace, and maintained the law" (p. 120).

Our author becomes even more dithyrambic in his praise of the administration of Sarawak, that remarkable principality in Borneo which was founded by the late Sir James Brooke, a young Englishman, who, after some military experience as an officer in the East India Company's service, had

gone out to Borneo with the hope of doing something for the people. He was led on till he became Rajah, and ruled for twenty-six years the dominion now ruled by his nephew. It is a benevolent autocracy, with which the British Government in no way interferes, though, of course, claiming the right to control foreign policy in return for the protection which it guarantees against foreign aggression. The account given of the paternal administration of this region of 50,000 square miles and about 500,000 people is extremely interesting. It is conducted by a few Europeans; the native chiefs are consulted and guided rather than driven; the relations between natives and Europeans are friendly; and the country is prosperous and peaceful.

Mr. Ireland comes last to the Philippines, and has severe strictures to pass on the policy followed by American administrations there. He comments on the folly shown in encouraging Aguinaldo, treating him as an ally and asking favors of him before it had been determined whether to retain the Islands. He is surprised that no attempt should have been made in the earlier years of occupation to ascertain what expedients other nations had employed in their tropical possessions, and to profit by the experience those nations had acquired. He criticises the examination for admission to the Philippine civil service, pointing out how low a standard of attainments it fixes compared with the examination for the British Indian [and Colonial] civil services. He condemns the mode of governing the Islands by a commission, holding that in countries in a backward political condition it is far better to put one man at the head, to whom the natives, accustomed for many centuries to no kind of government except a despotism, may look as their ruler; and he contrasts the results of having a commission at Manila with the results achieved by the one-man government of Gen. Leonard Wood in Cuba. He argues strongly against the control exercised by Congress over legislation for the Islands, and complains in particular of the limitations by act of Congress of the area of public land which may be sold to a corporation to 2,500 acres, and of the refusal of Congress to reduce the Dingley tariff rates upon articles exported from the Islands to the United States.

"Shorn of any real authority to determine independently the measures best suited to the needs of the Islands, compelled to legislate with one eye on the American public and the other on Congress, driven to adopt an apologetic tone in regard to all measures which are likely to arouse public sentiment in the United States, the Philippine Commission can neither command the respect of the people nor carry on its own work according to the plain needs of the situation. It has been stated frequently that, as a matter of fact, Congress has sanctioned every Act submitted to it by the Philippine Commission. This is perfectly true, but it is not due to Congress adjusting its mind to Philippine legislation, but to the Philippine Commission adjusting its legislation to the mind of Congress" (p. 211).

Mr. Ireland advocates the introduction of Chinese labor into the Islands, rating low the industrial capacity of the native Filipino; and he thinks that the American Government has begun at the wrong end in taking so much pains about education and spending so much money upon it. In his view it is far more important to stimulate economic development both by bringing in efficient labor and by constructing roads and other public works. The capital mistake, in his judgment, has been to apply to the Philippines ideas of policy conceived to be sound for America herself.

"A high tariff, an extended system of education, the exercise of political rights by the greatest possible number of the people, the exclusion of contract labor, and the application of the American navigation laws, all of which appear to have the approval of the American people as component parts of their home policy, have been transferred wholesale to a country which is separated from the country of the ruling power by every circumstance of climate, race, and civilization. The task which has been undertaken is, in fact, to make an American out of a Filipino" (p. 252).

It need hardly be said that our author does not expect success in this task. That there is some truth in his criticisms and his prognostications of the failure of a policy which thinks that instruction is sure to make semi-civilized people, long accustomed to indolence, become industrious, and to fit them for self-governing institutions—this may be admitted. The English have found that the natives of India are making a very slow progress, if any progress at all, towards that capacity for working a representative municipal system which they have tried to introduce. Nevertheless, here and elsewhere, Mr. Ireland strikes us as being rather too sweeping in his views, and rather too confidently positive in his expression of them. Still, his chapters on American administration in the Philippines, and the lessons he draws from what has been done by the English in some of their colonies (not in all colonies, for the English too have their failures) and recently by the Dutch in Java, for the Dutch have reformed the faults of their former administration—these things are well worth the study of all who desire to see the responsibilities undertaken so hastily and lightheartedly in 1898 discharged in a spirit and by methods creditable to the American people.

FIVE NOVELS.

Love's Cross-Currents. By Algernon Charles Swinburne. Harper & Bros. 1905.

The Breath of the Gods. By Sidney McCall. Little, Brown & Co.

Mrs. Darrell. By Foxcroft Davis. Macmillan.

The Lunatic at Large. By T. Storer Clouston. F. M. Buckles & Co.

A New Humanity; or, The Easter Island. By Adolf Wilbrandt. Translated from the German by Dr. A. S. Rappoport. London: Maclaren & Co.; Philadelphia: J. B. Lippincott Co.

There are few nowadays who do not need to be reminded that Mr. Swinburne once tried his 'prentice hand on fiction. Some forty years since, the attempt counted as a youthful indiscretion, since it is always indiscreet to write outside one's *genre* until it is certain what one's *genre* precisely is. But now it is forty years on, and Mr. Swinburne's tradition is fixed as firm as Sappho's or Tennyson's, and could not be confused though Mr. Watts-Dunton were to persuade his friend to resurrect half a dozen sketchy novels. Genealogy apart, the story of 'Love's Cross-Currents' is commonplace enough. Mr. Swinburne describes a situation rather than a progression of affairs, and the single incident of the book, a death by drowning, brings about no reversal and no dénouement. The epistolary novel is always a strain on the attention; and elaborate as Mr. Swinburne has made these letters, the most careful reader is left with a feeling of mystification. If an explanatory prologue is held to be a weakness when it is made an essential part of a drama, what is to be thought of a novel whose introductory chapter is a key without which the reader could not hope to follow the drift of the story? Mr. Swinburne had better have written out the whole in the style of his "Prologue," and avoided this "compromise between a story and a play."

It is a most uncomfortable family to which he introduces his readers. Five cousins are first complicated by the caprices of their parents. Following the parental example, the two girls of the family marry in haste, and soon discover a marked preference for the cousin to whom they are not united. But the Cheynes and the Harewoods, with their fluctuations of sentiment, are but the puppets of the protagonist Lady Midhurst, who is aunt or grandmother of the group. The pastime of her old age is to embroil her kinsfolk, and her favorite exercise to appear as the god from the machine and avert any unconventional consequences. Her letters to the young people are a series of cynical platitudes, seasoned by advice and suggestions that might bring a blush to the cheek of Chesterfield. As a love story, the book is entirely ineffective. What interest there is lies in the motives and machinations of this elderly relative, and the reader must be gifted with unusually acute sympathies if he is to keep up with the caprices of the younger correspondents. No young people ever wrote such elaborate letters, no aunt ever made mischief with so little to gain by her intriguing, and the intrigues of a clever old lady can seldom have had such barren results. The style is not peculiarly Swinburean, but it is naturally more vigorous, more telling than is common with writers of modern fiction. There are half a dozen stanzas of poetry in Mr. Swinburne's weaker manner.

A comprehensive review of 'The Breath of the Gods' would presuppose many months and years of sojourn in Japan. Are the Japanese phrases scattered throughout the book accurate? Is it a true picture of the land and its people? In short, is the local color as correct as it is startling? Confident answers to these questions are possible only to a traveller and a psychologist. Readers less well endowed will have to make, so to speak, a comparative study in local color, and argue from the known to the unknown. Thus, when we see that the American minister and his wife, daughter, and secretary are all conceivable American characters, we incline to think that the four principal Japanese personages, the despotic old *kerai* with his subservient wife and ideally beautiful and perfect daughter, and the great lord whom the daughter marries, may also be lifelike. But then the exaggeration and obvious caricature displayed in portraying the two Frenchmen, only distinguished by their differing component parts of sensuality and cunning, make us wonder whether the au-

thor really does see true where race prejudices are involved. The motto of the whole book might be said to be "Banzai Nippon," and every Japanese virtue, beauty, or charm seems to the author vastly superior to the same quality elsewhere. This may be the case, but the arguments are not convincing; indeed, the more glowing the descriptions, the less we believe them. Small obvious inaccuracies also tend to shake our faith. The Chinese poet Toemmei may be correctly quoted, but Burns certainly is not. The flora of Japan may be as glorious and sweet-smelling as we are led to believe, but "scented goldenrod" for an American herb sounds no less anomalous than "dumb perfumed music." Interiors in Tokio may be as the author paints them, but in Washington it is scarcely usual to have a grand "coming-out party" on a "white duck floor covering." Yuki's obi-domès and adzuma-coats may be true to life, but one starts to read of a "little French dressmaker on her knees beside" the American girl on the night of her first ball, with her mouth full of pins, to complete the toilet—pins so necessary, indeed, that the débutante on hurrying down stairs calls back: "Do not attempt to sit up, madame. Yuki is to stay all night and will help me with the pins."

To quote from memory one of Andrew Lang's criticisms, we feel that so much of the local color of which we can judge is wrong that we hesitate about pinning our faith to that which is unfamiliar. When, furthermore, we see that the author revels in tall talk and wallows in sentiment, reminding us vaguely first of "Les Précieuses Ridicules" and then of Marie Corelli, we feel that we need not afflict our souls over the verisimilitude of Yuki's death. In the novel, she loves a young Frenchman, but marries an old Japanese; she then becomes an incarnation of loyalty to her husband and her country, yet incurs the suspicion of the one and risks the welfare of the other in order to shield her quondam lover in illness; she has every reason to live for her land and the patriotic work she is doing, and yet she dies without exonerating herself so that her "sacrifice" may be complete. To the Occidental mind it all seems Much Ado About Nothing. But as, putting aside the truth or improbability of the story, the book is interesting in all parts and thrilling in some, we may read it with all the greater satisfaction because we give it the benefit of the doubt.

'Mrs. Darrell' does not leave on the mind any very salient impression. The story is slight, the characters shadowy, and the style, except for a strange abundance of *non-sequiturs*, exceedingly commonplace. Though occupied, we might even say obsessed, with the "smart set" and their doings, the book is in itself entirely without distinction. We follow Mrs. Darrell from Washington to India, from India to London and back again to Washington, without mustering up much interest in her love affairs, real and imaginary. She fancies herself in love with Reginald Darrell, elsewhere called "Jack," and discovers in a short time that she really loves Hugh Pelham "with all her soul, her mind, her heart," though the author reassuringly tells us at the end that "their unfortunate attachment had been in the highest sense elevating." Her husband dies, and while her Bayard of a lover is in Africa and represented, or rather misrepresented, by a bullying Scotch solicitor, the terrified and impecunious widow all but consents to marry the villain of the piece, the typical unscrupulous and godless millionaire from the West, with his well-known mysterious fascination for women. The villain is exposed by the lover of his own daughter, who figures as secondary heroine, and Mrs. Darrell marries the virtuous Pelham. There are just two good characters in the book—the heroine's old Virginian father, and a Washington "grande dame" of advanced years, but perennial youthfulness. We have met them before in various places; still, as old friends they are doubly welcome in an otherwise dull book.

The 'Lunatic at Large' is not at all probable, and not very edifying, but it is certainly well written and entertaining. Readers will be almost sure to smile at the wit, and laugh aloud at some of the escapades of the escaped lunatic who gives the book its title. How the impecunious London doctor ever induces the head of a respectable private asylum to receive a patient without explanations of any sort, and apparently at a merely nominal fee, we are never told. But it is essential to the story that he should do so, as the doctor is thereby enabled to enjoy with a pseudo-lunatic friend the foreign trip prescribed for and doubtless defrayed by the hero. This is, however, not unmixed enjoyment either during its course or at its close, for the two conspirators return to find that the real lunatic had escaped from his asylum shortly after their departure. His escape is effected with such cleverness, and his subsequent career with the German Baron whom he partly bearleads and partly leads astray in London and at the seaside, is so full of real wit and ingenuity that we are not wholly unprepared for the climax. The simple-hearted and forgiving Baron heaps coals of fire on his head by extricating him from his last dilemma, and the hero completely vindicates his restored sanity. Probably even the most just-minded person will regret that it is the sane, slow-witted German and not the quick-witted ex-lunatic who marries the utterly impossible but distinctly attractive Lady Alicia à Fyre, especially as the dialogue between her and the hero is the best thing in this extremely readable book.

In Helmut Adler, the leading character of Wilbrandt's novel, figures the engaging Nietzsche, drawn portrait-wise as to both personality and teachings. Modern European fiction, as the translator observes, abounds in the gospel of Nietzsche. A score of authors, in a score of novels, are busy with the themes of the ape-man, the over-man, the god-man. We were worms, we are apes; the over-man among us is to arise and evolve a race of god-men. Helmut Adler, in a night of agony at his wife's coffin, brings forth ideas which are to redeem humanity. To an island he will repair with a few chosen ones, and found a race of true men, noble, but, above all, strong. No advocate he for "equality-mongers." "Our idea will have nothing to do with the mass. . . . It aims . . . at a selection." Equality means simply an encouragement to the weak to live—the perpetuation of the ape: "sentimental pity with the eternal worthless." One of the fiercest of Helmut's quarrels, indeed, is with the nephew who proclaims his uncle a Socialist. Equally to be crushed is the doctrine of self-obliteration. Helmut's other chiefest clash is with the vegetarian hermit, who is "always talking his slave-morality, his feminine virtues—renunciation, abstinence, meekness, disgust of life: all this is good for slaves and cripples, but not for man." "My idea," Adler cries, "is not the 'release,' the liberation of the masses, but their enchaining through the might of the Spirit, through the power of the Elect! Dominion of the great ones, of the noble over the ape-men." "Our great misfortune, Christianity!" he exclaims. "It is changing the world into a vast hospital." Disgust for the ape-man, and aspiration, are the requirements for those who are to work with him, the self-constituted Phœnix who shall rejuvenate humanity.

Disciples are not lacking to Adler. When his published works shall have procured the funds, the island is to be bought, and then—"perhaps after thousands of years—the half-man will become a complete man." Opium and madness, however, overwhelm Adler; the apostle of strength succumbs to the least distinguished of weaknesses; and over this wreck sounds out a song from the heart of Schweitzer, his friend, doctor, and disciple—the song of the Easter Island as it now comes to him, clear and ordered:

"Much renunciation and a little hope; nothing more. That each person should begin with himself; each one, of course, being a whole crowd in himself; a crowd of inherited traits, qualities, impulses, weaknesses. Well, that each one should found amid this crowd of characteristics an *aristocracy*—that is not the word exactly; that he should pick out from this crowd a selection; copying, of course, the noblest examples, of the most enduring, of the best, of the most humane; and that he should guard this 'inner island' from the world, cultivating it and tending it with deepest affection; and so developing all its qualities to the full; not by pursuing a life that is half-life, shut out from the world, . . . but living a life full of activity, of eagerness, of love for the very living; . . . then one must seek the other; these 'Easter Islands' must find out each other, they must grow larger and larger—in the midst of the world itself. . . . Perhaps in ten thousand years there will develop from this concentration of the best a better humanity!"

Thus are embodied in the different characters varying philosophies. Westenberger is the recluse, returning to nature; Adler the preacher of the New Humanity, with his mad, bad, not all ignoble ideal of a world of strength and achievement, where should be no room for the weak or the pacific—or even for the good, the nice, the well-behaved. Bergmann, the flighty musician, may well stand for the world-spirit, gayly dispelling the shades when they threaten too seriously, yet himself shaken into manhood at the last. Emil is the spirit, let us say, of the nether-world, in whom the truth has no part—the moral shadow; Malwine, the woman element, patronized by her father, Adler, as nice, neat, and young-lady-like, but "ego-less," with "nothing for the Easter Island"—in reality the moral buttress of the family.

If the book is doctrinal and the doctrines heavy, it is not therefore a heavy book. On the contrary, there is so much sincerity in each point of view, combined with so much lightness of pen, that it is even absorbing reading; the way is tortuous, indeed, but not slimy.

FISKE'S CHESS IN ICELAND.

Chess in Iceland and in Icelandic Literature. With Historical Notes on Other Table Games. By Willard Fiske. Florence, 1905. 4to, pp. x., 400.

The late Professor Fiske was a man of many interests, not the least fruitful of which has been his devotion to the game of chess. In his early life he had taken an important part as player, organizer, and author in the development of American chess, and in his latest years he devoted much of his time to the advancement of chess in Iceland. From this latter activity arose his interest in the history of chess and other games (readers of the *Nation* will remember an able series of letters on "the origin of chess," which he contributed to this paper in the summer of 1900), of which the present book is the ultimate result. It is cause for sincere regret that Professor Fiske died as the last sheets were passing through the press, but fortunately so little remained to be done that Prof. Horatio S. White and Messrs. George W. Harris of Cornell and Halldór Hermannsson of Reykjavík have been able to complete the volume in the form its author intended it to take.

In attempting to give an account of the contents of the work, the reviewer is placed at some disadvantage by its unconventional arrangement. For this, Professor Fiske apologizes in his preface; it has resulted partly from changes of plan and the pursuit of new researches that suggested themselves as the book grew, and partly from the eccentric method of composition by which each sheet of print was sent to press as soon as sufficient copy was completed. The former precludes all considerations of proportion, the latter leads to numerous repetitions and modifications of opinion in the light of new information. Originally Professor Fiske merely intended to reprint two old magazine articles of his own upon Icelandic chess in history and literature. These, however, proved on examination inadequate in the light of modern knowledge, and they were accordingly amplified by the addition of further notes and references. While making these hasty additions, Professor Fiske came across references in dictionary and saga to the long-obsolete Icelandic game of *hnefatafl* or *hnottafl*, and turned aside to endeavor to solve the question of what it was, or at least to clear the ground by showing what it was not. Since lexicographers had identified it in turn with nearly every European boardgame, his investigations took the form of an inquiry into the nature and history of each of these games, and he began to collect and describe the literature of the subject so far as it was accessible to him. So absorbing and fruitful did this investigation become that the original plan receded into the background, and he saw that if he were to complete the treatment of Icelandic chess and the elucidation of the nature of *hnefatafl*, a second volume would be necessary. This he has not lived to write, but it is possible that such material as he had already collected may eventually appear in the Cornell publications relating to Iceland for which Professor Fiske has left provision.

Iceland obtained its knowledge of chess from England towards the end of the twelfth century. Professor Fiske has no difficulty in establishing a close intercourse between the two countries at the time, and gives a list of noted Icelanders who had studied in England in the latter part of the century. Any of these may have been the first to introduce the game into Iceland, where the game soon took a prominent place in popular favor. Transcribers and editors of the older literature added definiteness to the vague references to table games by substituting *skáktafl* for the colorless *tafl* or already forgotten *hnefatafl*, and players soon elaborated an extensive terminology At a later time the isolation of Iceland led to curious modifications in the rules of the game, which Professor Fiske explains at length. It is only in the course of the last century that Icelandic players have begun to adopt the ordinary European method of play.

Since *hnefatafl* has been variously rendered draughts, merrels, fox and geese, and tables, Professor Fiske next proceeds to investigate these games in turn. Before any identification could be accepted, it was necessary to show not only a resemblance in the method of play, but also the possibility of the game having reached Iceland sufficiently long ago to satisfy the evidence of the early sagas. Professor Fiske had no difficulty in showing that none of these games satisfy the conditions. The slight information we possess as to the nature of *hnefatafl* shows it to be a game in which one player with a number of pieces attacked his opponent's *hnefa*, while the opponent possessed in addition to the *hnefa* a number of pieces by which he endeavored to frustrate the attack. The only game that we know which appears to answer to this description is the Welsh *tawlbwrdd* (often translated throwboard, but in the first element of which Professor Fiske rightly sees the Latin *tabula*); from a passage in the 'Ancient Laws of Wales' ([1841] p. 436) it appears to have been at least a similar game.

The earliest authority for European boardgames is the magnificent MS. 'Libro del Acedrex' of Alfonso X. of Castile, written about 1283, and now preserved in the Escurial, near Madrid. This work not only treats of chess and various methods of using the dice, but adds a long section on the game of *tables*, and on other games, of which the most interesting is a group bearing the generic name of *alquerque* (=the Arabic *al-qirq*). Professor Fiske obtained access to a copy of this MS. too late to make full use of it, and his sections on draughts, merrels, and fox-and-geese need some revision in consequence.

In draughts (checkers) he sees merely "a greatly simplified chess, apparently devised in Spain during or before the thirteenth century." While this date and the country of origin are probably correctly stated, the arguments by which it is sought to establish the chess-ancestry of draughts are unconvincing, and unsupported by any available evidence. It is one of the difficulties in tracing the pedigrees of European board games that they received in mediæval Latin new designations upon the model of the classical *ludus latrunculorum*. Thus the Arabic *shatrang* (except in Castilian and Portuguese) became *ludus scaccorum* (*scaccus*=a chessman), the Arabic *qirq* became *ludus merellorum* (*merellus* = a coin or counter), the Arabic *nard* became *ludus tabularum* (*tabula*=the backgammon man). *Ludus dominarum* is a similar name, in which *domina* will mean the draughtsman, a use almost certainly derived from the chess term *domina*, used at first for a second queen obtained by the promotion of a pawn, and ultimately for any queen. There is considerable evidence to show that draughts is a development of an old form of merrels or *alquerque*. In Catalan it was formerly called *marro de punto* (*marro* is still Catalan for merrels, and *punto* is the name of a square of the chessboard); in Sicilian it was formerly *marrella*, while one of the varieties of *alquerque* in the Alfonso MS. shows the same method of capture, and the rule of "huffing" an opponent's man when it has omitted to make a possible capture.

So, also, fox-and-geese, admirably as it is treated here, has a closer connection with merrels than Professor Fiske suspected. It appears in the Alfonso MS. among the *alquerque* games as *de cercar la liebre* ("catch the hare"). In England, in the household accounts of Edward IV. (1461-1483) we find one for the provision of "two foxis and 46 hounds of silver overgilt" for two sets of "marelles." Fox-and-geese, in some varieties, appears to agree in part with the description of *hnefatafl*, but Professor Fiske is able to show that this game, now called in Icelandic *refskák*, is of later introduction into the island than chess.

To judge from many passages in the literature of the Middle Ages, the three most popular indoor pastimes of that period were chess, merrels, and tables. There still exist a large number of MSS. of the XIVth and XVth centuries in Latin, French and Italian, which contain collections of problems in these three games. Professor Fiske gives extracts from some of these, but at the same time repeatedly expresses his regret that he had not been able to make fuller use of them. His work, however, loses less by the omission than he imagined, and, after a careful study of these MSS., we have discovered no new information of material importance.

Of these games, merrels, or morris, is a very old and widely spread game. Professor Fiske quotes from an early Arabic work a passage establishing its existence in Medina as early as the VIIIth century. As Arabic scholars agree that *qirq* is not an Arabic word, its ultimate origin still remains to be discovered. Alfonso X. describes several varieties of it, and it appears to have been especially popular in the Middle Ages in France and England. From the latter country it came to America with the earliest settlers, though, apparently, the American variety that is now usual, the twelve men's morris, is unknown on the continent of Europe, and almost obsolete in England. In the latter country merrels has fallen in public esteem, and is now chiefly met with in rural districts, where it is played under a variety of local names.

The third of these games, tables, is the subject of the largest portion of Professor Fiske's book. The whole section is replete with evidence of patient and accurate scholarship. Professor Fiske has established the fact that "tables" was a generic name for any game played upon the backgammon board, and that it included a large number of varieties. He has recovered the rules of many of these varieties, and shows that the ordinary English game of backgammon is identical with one of the games described in the Alfonso MS. Spe-

cially full is the account of the Icelandic game *kotra*—a name derived from *quater*, one of the throws of the dice; indeed, he has left but little for the future investigator to discover in the history of tables in Europe. The outstanding problems relate to the ancestry of its Arabic forerunner, *nard*, and its connection with classical games that required the use of dice. But before this can be done it will be necessary for some student to make a careful study of the mass of information relating to Roman games that has hitherto not been used.

There is only one work with which Professor Fiske's book can be compared. It is more than 200 years since Dr. Thomas Hyde of Oxford published his 'De Ludis Orientalibus,' the earliest and still the most scholarly and reliable work upon Oriental games. What Hyde did for the East, Professor Fiske has now done for the West, with at least equal skill and patience. It is fortunate that, when this long-neglected corner of the history of civilization came to be written, it should have fallen into the hands of such a man as Professor Fiske, who combined the necessary practical skill in games with the linguistic and historical knowledge that has enabled him to deal scientifically with his authorities. The history of chess is still obscured by the unhistorical spirit of its earlier historians; Professor Fiske has spared this group of board games from a like reproach.

The Interdependence of the Arts of Design: Six Lectures delivered on the Scammon Foundation at the Art Institute of Chicago in 1894. By Russell Sturgis. Chicago: A. C. McClurg & Co. 1905.

Mr. Sturgis's first lecture deals with "Modern Judged by Ancient Art" as regards representation and sentiment; the second, with the same comparison as regards decorative effects; the third, with the industrial art in which form predominates, and the fourth, with those in which color predominates; while the fifth and sixth lectures are devoted, respectively, to the use of sculpture and painting in architecture.

The book, which is somewhat profusely illustrated, bears otherwise the traces of its origin, and reads rather like the slightly revised report of extempore talks than like a formal treatise; the text tending to become a sort of running commentary on the pictures, enlivened by a broad culture and a much wider knowledge of the subject than find room for expression, but rather incidental and inconclusive, containing many interesting hints and excursions, but with no course of reasoning pushed very far. It is as if the speaker had relied on his store of learning for his matter and his lantern-slides for suggestion, and had found so much to say that very little of it got itself said completely. He treats the matter of many volumes in the space of one without the rigid selection that would be necessary to make a few truths entirely clear. Something of this effect is, doubtless, due to the temperament of the lecturer as well as to the form of the lecture, for Mr. Sturgis is always inclined to see at least two sides to every proposition, and to feel that in art and criticism nothing is unqualifiedly true. Probably he would be quite content that his lectures should be found stimulative, and would disclaim the intention of being formally instructive.

Of course, Mr. Sturgis's inconclusiveness is only relative, and there are certain pretty definite conclusions to be found in these lectures, as that, for instance, modern art has gained little over the old in expression and has rather lost in decorative beauty; that it has gone farthest in the observation and record of external nature; that in the minor arts it does better with color than with form; that it can produce fine statues and paintings, but is uninventive in pure ornament, and the like. And even where he is inconclusive he is suggestive, which is perhaps better. The lectures must have been valuable to the students for whom they were primarily intended, and may be read by others with pleasure and profit.

There is one point incidentally discussed by Mr. Sturgis, which we venture to pick out for comment—hardly for criticism. In describing Oriental damascened work in metal, he alludes, in passing, "to the fortunate possession by the Arabic-speaking people, as also by the Chinese and their fellows of the Far Orient, of a system of written characters which are beautiful in themselves," and goes on to say: "It is easy to see that it is of immeasurable benefit to the decorative arts in Japan, in China, and in the Moslem East, that their written characters, which replace the letters of our alphabet, are capable of such exquisite treatment." Now that this has been said so often is, in itself, some proof that it is true, and its truth as regards the minor decorative arts is patent; but it is at least curious that great figure designers always seem to prefer the most rigidly plain lettering, and that all attempts to construct decorative variants of our Roman alphabet have been the work of ornamentalists, never of great figure painters. Even any marked irregularity of lettering seems always to have been intolerable to the great figure designers, with the single exception (of course a very significant one) of the designers of Greek coins. It would almost appear that Ruskin was right, and that the great masters of the figure valued their lettering for its ugliness as a contrast with the beauty they dealt in, were it not that they evidently took great pains with its proportion and spacing, and that certain Renaissance inscriptions are, in fact, delightful to look at in themselves and apart from their surroundings.

We believe that what the great figure designers have cared for in neat lettering is not ugliness contrasted with beauty, but one kind of beauty contrasted with another—formality, rigidity, and angularity contrasted with freedom, grace, and curvature. The Greeks designed the figure so severely that they did not need the contrast of formality in their lettering, but they did enjoy the contrast of angularity with curvature, and seem to have made the forms of their letters as angular as possible. The formality of our Roman alphabet is so valuable as a contrast to the rich curves of free figure designing, and as an escape from the over-luxuriance that would come of marrying cursive lettering to such design, that it is far finer for the purposes of a fully developed art than any Oriental alphabet. Imagine the inscriptions on the frescoes of Raphael or Michelangelo replaced by Arabic or Chinese, and ask yourself if the loss of appropriateness and the right kind of beauty would not be greater than the loss of intelligibility. Often enough the inscriptions are there, we believe, more for the delight of the artist in the effect of them than for any necessity of explanation. Imagine an Arabic inscription on a Greek coin, and ask yourself whether the undeniable beauty of the letters would not be too insistent, too distracting from the beauty of the figure sculpture, whether it would not be out of place and intolerable. The fact seems to be that the Arabic characters are so beautiful that they must be themselves the principal subject of any work of art in which they appear; and even the more rigid and formal characters of the Chinese and Japanese are ill adapted for subordination to fully matured figure design. If the Oriental ornamentalist is fortunate in his alphabet, the great European designers of the figure have been no less fortunate in theirs.

Scandinavia. By R. Nisbet Bain. Macmillan. 1905.

The First Romanovs. By R. Nisbet Bain. Dutton & Co. 1905.

The literary activity of Mr. R. Nisbet Bain is attested by the appearance in quick succession of two volumes on northeastern Europe, whose titles we cite above. The book on Scandinavia, which is a contribution to the Cambridge Historical Series, takes up the political development of Denmark, Norway, and Sweden at 1513, and follows it to 1900. At the present moment, when the eyes of the world are fastened upon the "sovereign State" of Norway, Mr. Bain's last chapter will probably be read with the greatest interest, for therein he discusses the relations of Norway and Sweden since 1814. From this date forward Norway has sought to secure full political equality with Sweden, and, as the Act of Union was ambiguously worded, there has been perpetual friction over the meaning of the Constitution. The present crisis, however, may be said to date from 1880, when the radical irreconcilables gained control of the Norwegian Storthing, and made the position of conservative mediators like Frederick Stang untenable. From 1884 to 1889 the radicals under John Sverdrup had a ministry of their own; but as the responsibilities of office made Sverdrup less anxious to dissolve the Union, his party fell apart, and at last became demoralized by the split which arose in 1887 over the church organization question. With the radicals who triumphed in 1891 and 1897, Mr. Bain has little sympathy, and flatly styles Viggo Ullman "a professional agitator." His general attitude towards the Norwegian patriots or secessionists may not unfairly be deduced from the first sentence of the preface, where he says: "The political history of Scandinavia is the history of the frustration of a great Baltic Empire." In the early part of the sixteenth century, all the main tendencies seemed to be pointing towards the attainment of that unity which would have made Scandinavia a leading power, and which was frustrated by the unfortunate ferocity of Christian II. in ordering

the "Blood-bath of Stockholm" (1520). The last vestiges of union are now being shattered by Norwegian ambition.

"The treasonable coquetting with Russia," says Mr. Bain, "of ultra-Radicals like Björnson and Ullman, who have gone so far as actually to propose the virtual cession of two ice-free ports to that power, is eloquent of Norway's suicidal tendencies. With Russia at her very door, an independent Norway would be far more dangerous to Sweden than an independent Ireland would ever be to Great Britain. Nor can it be fairly said that Sweden has not endeavored to meet half-way the views of her sister State as regards foreign representation."

This passage will serve to indicate Mr. Bain's point of view in dealing with the current political situation. For the rest, his epitome of Scandinavian annals is clear and well arranged, giving about equal prominence to Denmark and Sweden.

'The First Romanovs' is a work which covers less ground than is traversed in the Scandinavian volume, and is marked not only by a greater fulness of detail, but by greater concentration of purpose. Here Mr. Bain seems almost to support a definite thesis, for in tracing the fortunes of the Romanoffs from Michael, the founder, to Peter the Great, he gives to a single family the credit of having created Russia. His inference would be that at this moment the country is quite unfit for constitutional government, as it is understood in western Europe. Bishop Creighton, after his return from the coronation ceremonies, was at some pains to point out the absurdity of applying English standards to Russia, and Mr. Bain is even more distinct when he says:

"It is an indisputable historical fact that Russia owes everything to the Tsars—her prosperity, her greatness, her empire, her very existence. The Tsars have made many mistakes, and the mistakes of an autocracy must always be more glaringly obvious than the mistakes of any other form of government; but any impartial critic, taking a broad historical view of the one hundred and ninety-eight years [*sic*] during which the Romanovs have held sway, must admit that no other European dynasty has so conscientiously, and on the whole so successfully, done its duty."

As Michael Romanoff became Tsar in 1613, we find it difficult to account for Mr. Bain's chronology in the foregoing passage, for 292 years have, by our arithmetic, elapsed since then.

Mr. Bain's description of the anarchy which preceded Michael's accession forms a picturesque starting-point for a defence of strong government.

"Rarely," he says, "has any European country been in such desperate straits as Russia was in 1613. The Swedes occupied all her Baltic provinces, as well as Novgorod, her commercial metropolis. The Poles held all her western and most of her central provinces. Savage hordes of Tartars and Cossacks swarmed in every direction, leaving a smoking wilderness behind them. In the extreme north, thousands of native freebooters and vagabonds pillaged, burned, and slew. In the extreme southeast, Zarucki, the last of a long line of pretenders, aimed at carving out a kingdom of his own on the Volga. From every quarter of the Tsardom came tales of woe."

Three centuries later, the last sentence is almost equally true, and Nicholas II. has enough before him if he would realize Mr. Bain's conception of what, in the light of history, a Tsar should be.

It must not be inferred, however, that this book is a panegyric of absolutism, or that it minimizes the importance of men like Matyeeff, Nikon, Pososhkoff, and Vasily Golitsuin. Roughly speaking, the first half is devoted to Michael, Alexius, and Sophia, the second half to Peter the Great. Political in the main, the narrative is interspersed with interesting chapters on the social and religious life of old Muscovy, as well as with a detailed account of Peter's administrative system. Mr. Bain is one of the few Englishmen who can write on Russian and Polish subjects from a first-hand knowledge of native sources, and the present volume is in many respects the best he has given us.

Napoleon: The First Phase. Some Chapters on the Boyhood and Youth of Bonaparte: 1769-1793. By Oscar Browning. John Lane. 1905. 8vo, portraits.

Mr. Browning informs us in his dedication that this, his latest book, has been inspired by the work of Lord Rosebery, his lifelong friend; hence his title. Unfortunately the choice suggests comparison, and, if there is little to choose in the historical value of the two books, in every other respect the "Last" is immeasurably the superior of the "First" Phase. Lord Rosebery has a personal and interesting style, and, whatever his subject may be, Napoleon or Pitt, bibelots, horse-racing or passive resistance, there is generally both matter to amuse and to instruct. With Mr. Browning the case is far otherwise, and in his present book he does not even attempt to excite our interest by furnishing us with new facts on Napoleon's youth, contenting himself with summarizing briefly from other writers, and chiefly from the admirable works of Masson and Chuquet. His publisher, Mr. John Lane, does not imitate his author's proper candor in this respect, but presents the reviewer with a typewritten Literary Note in which it is stated that "This period of the Emperor's life has never before been attempted in detail." The fact is, as Mr. Browning himself is perfectly open to admit, that Chuquet, Masson, Jung, Nasica, Coston, Libri, and others have long since explored this field; what he offers being merely matter equivalent to two or three magazine articles extracted from them.

There is one feature of the present work that might in a novice be passed over, but which in an official expositor of modern history at one of the great universities of the world creates little less than amazement. Carelessness, to use no more unpleasant word, is the predominant note of the book. At nearly every page the reader with any nicety of sense as to the use of the English tongue is offended by the Gallicisms into which the use of French authorities leads the writer. Thus, to note a few instances, we have "polygon" for "range," and are told that Louis Bonaparte slept in a cabinet—a remarkable feat. And we get even beyond Gallicisms into a sort of no-man's land between French and English fit only for the creators of Volapük and other international tongues, in which we find French soldiers crying "victorie," and a committee of the French Government described as the "Councel Éxecutif Prouisoire." Among many similar mistakes that constantly irritate the reader, a few more may be noted. Thus, we are told that the Corsicans vowed the Bonaparte family to "eternal execution"; we are confronted with the word "cameraderie," more suggestive of photography than friendship; we find such a well-known name as that of Bourrienne nearly invariably misspelt, and we are introduced to such strange and incorrect forms as the Countess *of* Potocka. This feature of the book is the more noteworthy because a somewhat similar quality is apparent in Mr. Browning's judgments. His description of Saliceti as "cold and petulant" may conceivably be only a vague effort at epigram, but his statement that Pozzo di Borgo "eventually succeeded in crushing Napoleon" can only be described as nonsense. Pozzo had influence, and it was wielded against the Emperor, but to ascribe decisive importance to it is what no recognized authority has done or is ever likely to do. A similar symptom appears in the less strong case of the flight to Varennes. Mr. Browning describes this as "the most important incident of the Revolution," but one may suspect a prejudice arising from his own acknowledged competence on that special topic—for Mr. Browning has done good work in earlier days, but, alas, whereas of the books on Napoleon the *last phase* is better than the *first*, with Mr. Browning it is just the other way about.

Early Dutch and English Voyages to Spitsbergen in the Seventeenth Century. Edited with notes, by Sir Martin Conway, London: The Hakluyt Society. 1904. Pp. 80, xiv, 189. Illustrated.

This addition to the valuable library of reprints of rare documents concerning exploration and the history of navigation, which the Hakluyt Society has given to the world, comprises historical papers relating to the Spitsbergen whale fishery, together with an introduction and explanatory notes, a bibliography, and a very full index.

The group of islands collectively known as Spitsbergen was discovered and named in 1596 by Jacob Hendrikzoon Heemskerk, who, with Jan Corneliszoon van Ripp and Willem Barentz, as pilot, were seeking, by direction of the States-General, in two Dutch ships, for a passage through the Arctic seas to China and Japan. This same Heemskerk later earned great fame in the Dutch navy by his courage and ability in action off Gibraltar. The next visitor to these shores was Hendrik Hudson, who was exploring in 1607 for the Muscovy Company of London. He visited the east coast of Spitsbergen and examined several bays, but in reality added little to geographical knowledge. However, the reports brought back by this expedition of the great number of whales frequenting this coast led directly to the establishment of the Spitsbergen whale fishery, in which the fleets of most of the then maritime nations contended for the mastery during many years.

With that nonchalance in disposing of newly discovered lands characteristic of the time, English, Scotch, and Dutch rulers furnished their subjects with patents of monopoly in the fisheries of Spitsbergen, while interlopers claiming the freedom of the seas disregarded impartially the conflicting claims of all others alike. At the head of the whaling profession in those days stood the Biscayans, who took service now with one, now with another party, when they were not foraging on their own

account. The trying out of blubber took place on the shores, since the whales frequented the bays and inlets, and the Dutch headquarters at Smeerenburg is said to have harbored, during the height of the fishery, a summer population of 20,000 men. The huts, try works, and other outfit were left behind when the fleets departed for the winter, and the first comers in the spring frequently destroyed the property of this kind belonging to their rivals. As a measure of protection, a few attempts were made to leave a small number of men over winter, as watchmen, but in several cases these unfortunates perished miserably of cold and scurvy. Gradually the whales diminished in number, or forsook the bays which had been their resort, the whalers kept to the open sea in pursuit, the shore fisheries dwindled, were at last abandoned, and the Arctic calm once more prevailed where for years rivalry, rising to the point of bloodshed, had been almost the rule.

The scattered documents bearing on this episode in the commerce of Europe have a sociologic as well as an historic interest. In this volume, Sir Martin Conway has brought together the narrative of Hessel Gerritsz (1612), entitled 'Histoire du Pays nommé Spitsberghe'; that of William Heley and his associates, relating to the troubles at Spitsbergen in 1618; the journal of seven seamen left at Spitsbergen in 1633; of Jacob van der Brugge and his party, who wintered at Smeerenburg in 1634, and fortunately survived; and the journal left by the party which took their place the following winter, and were all found dead on the return of the ships—together with several chapters descriptive of the quarrels of the whaling parties among themselves, from contemporary documents. All these were well worth preservation, and are illustrated by facsimile title-pages, maps, and sketches. The publication is in the well-known form adopted by the Society, to which students of history, geography, and adventure are under serious obligations.

BOOKS OF THE WEEK.

The Elements of Railway Economics

By W. M. ACWORTH. Cr. 8vo, cloth, 70 cents.

"An intelligent man, if he will apply his mind for a few hours to the study of this little book, may have a clearer understanding of the problem of railway rates than is now manifested by . . . and by most of our public speakers and newspaper editors. . . . The American people stand in especial need of its lessons, and their need has never been so great as it will be during the coming years."—*The Evening Post, N.Y., May 8, 1905.*

READ

HUGO MÜNSTERBERG'S

The Eternal Life

Memoirs of Henry Villard

JOURNALIST AND FINANCIER

1835-1900

Two volumes, with Portraits and Maps, $5.00 *net*. Postage, 35 cts.

An autobiographical record of the varied and romantic career of the war journalist who subsequently became a power in the financial world, and carried the Northern Pacific Railroad to completion. Full of incident and valuable for its reminiscences of Lincoln and other prominent men of the time, as well as for its descriptions of important battles of the Civil War.

"A book of extraordinary interest. It is written with great ability, in a clear and flowing style; it details with perfect candor the incidents of a great career; it is an admirable report of great events, all of which the writer saw, and a large part of which (after 1870) he was; it exhibits the rise and growth of a rich and powerful personality and a character at once remarkable for its simplicity and its variety."—JOHN WHITE CHADWICK, in the *New York Times* Saturday Review.

"This posthumous autobiography of the late Henry Villard is a work of exceptional interest."—*Commercial and Financial Chronicle*, November 12, 1904.

The Usual Summer Educational Numbers

OF

THE NATION

Will be issued this year on August 31 and September 7

and will reach the professors and teachers in all the leading colleges and academic institutions in the country. Four thousand extra copies of each issue will be sent to persons interested in educational affairs in addition to those sent to regular subscribers, and as there will be different lists for each of the special editions, advertisements should be inserted in both of them in order to reach the entire list.

The first issue will be sent to teachers of English, Literature, Languages, History, and Economics; the second number going to those teaching Philosophy, Physics and Chemistry, Mathematics, and Natural Sciences.

Copy for the first of these numbers should be received by Tuesday, August 29, and for the second by September 5.

THE NATION

Publication Office, 206-210 Broadway, New York City.

The Best Issues of the Fiction Season

Mr. Robert Herrick's
The Memoirs of an American Citizen

Crisp, straightforward and strong, this book not only holds the reader steadily, but leaves plenty behind it to think of and talk about. It is a study of the making of a Senator of the United States.

Illustrated from drawings by F. B. Masters. Cloth, $1.50

Mr. Maurice Hewlett's The Fool Errant

BEING THE MEMOIRS OF FRANCIS-ANTONY STRELLEY, ESQ., CITIZEN OF LUCCA

carries its reader along in a lively series of picaresque adventures as far removed in time and place from present-day cares as well can be. "Whimsical, vagrant, purely fanciful, utterly charming," says the *Chicago Tribune.*

Uniform with "The Forest Lovers," etc. Cloth, $1.50

NOW READY

Miss Robins's A Dark Lantern

"Written by an extraordinary clever woman, and animated by passion and truth, it is a book no discriminating reader can afford to leave untouched."—*Boston Herald.*

3d Edition. Cloth, $1.50

Barbara's At the Sign of the Fox

"In sharp but smiling shafts at the foibles and artificialities of modern society, in a rarely delicate humor, in a wholesome love of out-of-doors and all God's creatures, human or unhuman, and, above all, in the gentle preachment of a very sane and beautiful philosophy,—in all the qualities, in short, that made the excellence and charm of 'Barbara's' other books, her new one will not be found wanting."—*The Globe.*

By the Author of "The Garden of a Commuter's Wife."

Second Edition. $1.50

John Heigh's The House of Cards

is a striking novel; unusual, its very construction original; its types intensely modern and portrayed with a charm that comes from the combination of a certain cynical humor and an undercurrent of sweet and true sentiment.

Cloth, $1.50

Mrs. Banks's The Little Hills

is full of quaint, half-forgotten, old-time fragrances; as her "Oldfield" suggested lavender and briar-rose, so this leaves behind it the sweet odor of spice-pinks. "It is perfect in its 'Cranford' way."—*Boston Herald.*

Cloth, $1.50

Mr. Jack London's The Game

"Nothing Mr. London has written is better than this brief yet tremendously forceful story."—*Times-Union,* Albany.

Illustrated in colors. Cloth, $1 50

TO BE READY IN SEPTEMBER

Miss Beulah Marie Dix's
The Fair Maid of Greystones

is a story of the period she has made peculiarly her own by reason of the vivid truth of her narratives, of which the best known is "The Meeting of Christopher Ferringham."

Cloth, $1.50

Mr. Emerson Hough's
Heart's Desire

tells with delightfully spontaneous drollery the stories of how various things first came to the little Rocky Mountain town of "Heart's Desire." Love and the Law, Art and "the littlest girl from Kansas," are but a few of them.

Illustrated by F. B. Masters. Cloth, $1.50

Mr. John Luther Long's
Heimweh, and Other Stories

carries in every page that delicate touch, that appreciation of many hidden mysteries which has lent to his writings —as in "Madame Butterfly"—the exquisite thrill of longing for something too beautiful for this earth.

Illustrated. Cloth, $1.50

Mr. Eden Phillpotts's
Knock at a Venture

is as if he had taken the cream of the rustic Devonshire episodes of his best novels and given us a complete book, racy, quaint, and full of the romantic charm that seems a part of the ryve soil of Dartmoor.

Cloth, $1.50

THE MACMILLAN COMPANY, Publishers, 64-66 Fifth Avenue, New York

The Nation.

NEW YORK, THURSDAY, AUGUST 24, 1905.

The Week.

As we go to press, peace still hangs in the balance at Portsmouth, owing to the Japanese claim which we have elsewhere argued to be unwarrantable. Upon a deadlock, the President has once more stepped upon the scene as *deus ex machina*. "You refuse," he is reported in effect to have said to Russia, "to surrender Saghalien, to pay indemnity. Never mind. Saghalien is, you must admit, in *de facto* possession of the enemy. Now let Japan weight that counter in the adjustment as heavily as she will, on condition of restoring the island. The total payment on this account may prove to just about equal that of the indemnity, when both sides should be satisfied. If not, ho for arbitration on the proper sum." Happy thought!

In the Czar's proclamation of a Russian National Assembly, we witness merely the natural and inevitable result of the political forces which have long been at work in Russia. They have come to this expression sooner than they would have done but for the great break-up due to the war, but they were bound to come one day. Self-sufficient autocracy is passing away. The governed are to have something to say about the government. It is easy, of course, to point out how far the Czar's proposals are from full representative government. The people are to elect delegates, but the latter, so far as now appears, are to have only a sort of consultative and veto power. But it is the beginnings which count in political revolutions. The first step once taken, the others follow. It is obvious that the Russians themselves regard the Czar's manifesto as their induction into the methods of free government. In spite of Tolstoy's mystical warnings, they are tasting liberty and finding that it is good. That the process of passing from the old to the new régime should be slow, is probably best. Sir Donald Wallace has forcibly insisted upon the need for some sort of interregnum between autocracy and constitutionalism. This makeshift Assembly may provide it. And when we are tempted to think the old order too long in passing, let us remember, as Villari reminds us, that the English Revolution was forty-nine years in coming full, that the French lasted from 1789 to 1815 (or 1871), and that of Italy from 1821 to 1870.

Speaker Cannon has been able to obtain only the vaguest idea of what was done at the reciprocity conference in Chicago. "They had a conference on something," he says, but what did it amount to? Nobody of importance was there—that is, no eminent stand-patter. Of course, Gov. Cummins and ex-Senator Harris of Kansas attended, but they must be indulged in little fancies like that. Eugene Foss of Boston was present to tell of the strenuous work of Senator Lodge for reciprocity; but Foss is merely another crank. Douglas was made Governor of Massachusetts on a platform demanding freer reciprocal relations with Canada, but, of course, Mr. Cannon is not concerned about that. It is doubtful, also, whether the Speaker ever heard of Gov. Elrod of South Dakota, who now joins Gov. Cummins as a disciple of the "Iowa idea." "I am a protectionist," he declares, "but such a protectionist as those at the Chicago Convention. . . . I believe in a protection which means ultimate free trade." He sees no other result of any successful policy of international trading, and thinks that the tariff schedules must be modified at once to meet new conditions. Perhaps Mr. Cannon will be surprised to learn that Gov. Elrod was the candidate of the "old" Republican organization against a "radical" party man, and that tariff insanity is not supposed to run in the family.

Mr. Foss did well to expose at the Chicago Reciprocity Convention what he called the "bunco game" which Senator Lodge played upon Boston business men. The latter sought out the Senator in Washington, and got from him profuse pledges of assistance in the matter of the Newfoundland reciprocity treaty. Later, however, they called upon Secretary Hay, who "mildly intimated his surprise at the confidence the committee reposed in the good intentions of Senator Lodge." Mr. Hay was not so easily fooled. He had accurate information, and knew who was doing his reciprocity treaties to death. The late Secretary had a pretty talent for sarcasm, and, if we are not misinformed, used often to exercise it at Lodge's expense. Indeed, his "surprise" at any one's being taken in by that gentleman was not always "mildly intimated." Those who have heard him discourse on Lodge's heroic defence of the makers of bogus jewelry, know what a provocative to laughter—and to scorn—was lost to the world through his remarks being private.

Having failed in its efforts to induce the Cuban Government to pass a bill to admit American rice on more favorable terms, we hope the Administration at Washington will lend no countenance to the wild talk about this being a deathblow to Cuban reciprocity, if not to Cuban independence. The Cuban Congress was entirely within its rights. Our Congress would certainly look queer in railing at it for refusing to reduce customs duties. President Palma, too, was acting as a Constitutional Executive when he declined to put pressure upon the Congress of Cuba in order to get the bill passed. It is even stated that, in addition to the urgency of our Minister, Mr. Roosevelt himself wrote Palma a letter urging the passage of the bill. The Cuban President might have replied that, in Havana as in Washington, it was sometimes impossible for the Executive to make Congress do as it was bid. Anyhow, it is no case for reproaches, much less threats. The self-governing Cubans have done what they thought was for their best good. Let not the result be to restore Borrow's old picture of "insolent Yankees swaggering at the Havannah; with the air of saying that they would come and take the country when they got ready."

It seems to be taken for granted that there will be Federal control of insurance simply because Senator Dryden, representing New Jersey and the Prudential, urged it upon the President last week, and Mr. Roosevelt did not say him nay. But there are several lions in the way. One of them is the Constitution, as interpreted by several decisions of the Supreme Court. They have denied the power of the United States to interfere with insurance companies chartered by a State. The President's own Commissioner of Corporations, Mr. Garfield, in his report of last December, specifically declared that "the decisions of our courts regarding insurance" make it highly doubtful if Federal regulation would be legal. Even Senator Dryden admits that the weight of judicial opinion is heavily against his bill, but he thinks there is "an even chance" that the Supreme Court might be induced to reverse itself. He reports the President as willing to approve the bill and throw the matter into the courts. Thus we see what a mistake Mr. Bryce made in excluding the Constitution of the United States from his classification of "flexible" Constitutions. The correct theory is that it can be flexed "while you wait."

President Roosevelt felicitously expressed his obligation to the banner Republican State when he remarked that he had 500,000 reasons for esteeming Pennsylvania. It is painful to report that 60,000 of those reasons were worse than

null and void. The second canvass of the registration lists in Philadelphia brings the number of fraudulent names up to 60,083, or more than one in seven of the voters listed last fall. This amazing total fully confirms every charge made by those "slanderers of Philadelphia's fair fame" whom the city so long refused to listen to. The first canvass made by the police brought to light only 31,749 illegal voters, the second added 28,334, and changed the totals in all but twelve wards. Thereupon, the utterly discredited Republican City Committee comes to the front again with the bland assurance that it will take the work in hand now, and outdo all others in purging the registration lists. As the Republican *Press* remarks, this will mean "plenty of work for the leaders. James P. McNichol will have to show that there are more than 4,000 fraudulent entries on the voting lists of the Tenth Ward; 'Charlie' Seger will have to beat the 3,000 record of the Seventh, and Sheriff Miles will have to do better than 3,700 for the Thirteenth, etc." How many of the names stricken out were real "phantoms," pet dogs or canary birds, the lists as now published do not show. "Removed," "never lived there," "not citizens," "no such number," "dead," and "not known," do not tell the whole story. Yet the difficulty of making the test is shown by the number of dismissals from the police force for neglect of duty and disobedience while it was in progress, and the number now awaiting trial, which is larger than ever before in the history of the city. But Philadelphia's history contains few events more important than this wholesale disinfection of the electorate.

Of all paradoxical ways of accounting for the final downfall of J. Edward Addicks, the most extraordinary is to say, as the Delaware dispatches do, that he has "lost the support of the Union Republican organization"—as if the Union Republicans ever had any other aim or object than the support of Addicks, and there remains any reason for the existence of their organization now that he is "down and out." As well say that the Protective Tariff League has lost its interest in the Dingley bill, or that the Society for Foreign Missions will no longer try to spread the gospel. When an association is formed for one and only one specific purpose, and it abandons that purpose, it is, to all intents and purposes, dead. Addicks, of course, may continue his "great campaigning" from now till doomsday; the only argument which ever won a vote for him is no longer available, now that the sheriff is levying on his property. The really interesting question about Delaware politics remains. The two Republican wings will now flap together, we are told, and Delaware will have two Republican Senators—if the Democrats do not capture the Legislature. But what will the voters do at the next election if nobody is prepared to buy them? Habits of years are hard to break.

The lower branch of the Georgia Legislature, by a vote of 106 to 6, has passed a bill which abolishes the battalion of negro troops in the State militia. It is expected that the Senate will also pass the measure, and that Gov. Terrell will approve it. The discussion in the House indicated the strength of the colorphobists in Georgia. Mr. Land, the author of the bill, said that, under the Dick National Militia law, it might conceivably become necessary for white troops to associate wih negro troops, and that "the easiest way to get rid of the question was to muster out the negro troops." Mr. Wright was more direct. He was opposed to giving any negro officer the chance to outrank a white officer under any circumstances. Mr. Felder favored the bill because the existence of negro troops in the State "kept white boys from entering the military service." Representative Hall, one of the six who opposed the measure, pointed out the danger of the State's losing the annual Federal appropriation of $25,000 if the colored troops were mustered out simply because of their color. Further, he said that these negro soldiers had in no instance failed to come up to the standard in efficiency and conduct, and that there was not the remotest danger that they would ever be put into white regiments. Mr. Stovall supported Mr. Hall in the statement that the negro troops were made up of the best of their race in the State. But the bogie of "equality," once raised, sent the bill through with a rapidity and unanimity that should have pleased even the Rev. Thomas Dixon, jr.

In the anthracite war of 1902, the price of peace was advanced by the consumer of anthracite coal in the form of higher prices for that kind of fuel. It is some compensation to learn that the three-year treaty of peace concluded between operators and miners has worked well. It is not reassuring to remember, however, that the labor agitator who lives on trouble is pointing significantly to the date—March, 1906. Before that time comes, it is to be hoped that arrangements may be made to continue the present *modus vivendi*. The axis of the present agreement is the Board of Conciliation. This body consists of six members, three representing the miners and an equal number the operators. The anthracite region is divided into three districts, and in each district a representative of the majority of the workers, who *ipso facto* is a union leader, is chosen to the Board. Before the Board of Conciliation considers a complaint, it exacts evidence that the parties litigant have first tried to settle the difficulty between themselves. Failing such settlement, the Board hears and passes on the complaint, referring all tie votes to a referee, Mr. Neill, United States Commissioner of Labor. The Board also declines to act on a complaint in case of a strike or lockout while the case is pending. Since June, 1903, there have been 141 grievances filed, 10 by the operators and the remainder by the workers. Of these complaints, 19 were wholly and 3 partially sustained, while 11 were mutually settled, and 3 were compromised. Of the remainder, 28 were not sustained, and 46 were withdrawn, while the other 31 cases are pending. In only 17 cases did a deadlock ensue which required an appeal to the referee. The tribunal in question has apparently prevented sudden interruptions of mining, and has brought a large measure of tranquillity and prosperity to the anthracite district. Its benefits have been too pervasive to be forgotten, and any interruption of industrial peace by agitation for a universal eight-hour day or further exclusive recognition of union miners would be a public misfortune.

A recent Census Bulletin confirms the long-established fact of a progressive decline in the natural growth of population in the United States. As early as 1820 the tendency towards a slackened rate of increase was noticed. The same tendency is operative in Great Britain, and normally follows a progressive rise in the economic standard of living. Professor Wilcox, who analyzes the census data in the recent Bulletin, points out that the exact birth-rate for the United States is not known; yet he regards the proportion of children to the total population, and especially to the women of child-bearing age, as "an approximately accurate and significant clue" to the natural growth of population. Since 1860 the ratio of children to women of child-bearing age has shown a decrease with every decennial census. For children under five years of age, the decline in the ratio between 1860 and 1900 has been from 634 to 474. (It is noteworthy that between 1890 and 1900 not a single State in the North Atlantic division took part in the decrease.) Among the negro population also the proportion of children is far less in 1900 than in 1880. Confirmation of the general theory that the decline in the birth-rate is consequent upon a rising standard of living, is the newly attested fact of the larger families born to mothers of foreign stock, the difference being almost two to one in their favor as compared with native Americans.

It is fortunate that the court of inquiry was able to determine so precisely the cause of the terrible explosion

on the *Bennington*. We have here no insoluble mystery. One of the boilers was ignorantly and recklessly handled and blew up, that was all. But the disaster cost the navy more men killed than did the entire war with Spain. Of the men immediately responsible, all are dead. Yet the court very properly brings home the ultimate responsibility to the young ensign, C. T. Wade, who neglected to check off the work of his careless subordinates, did not make the tests of the safety of valves and boilers required by the navy regulations, and in general showed himself "negligent in the performance of his duty." The court of inquiry, therefore, recommends that he be tried by a general court-martial. This is well. In no other way can discipline in the navy be maintained. Yet it is undeniable that other questions lie behind. Responsibility for the *Bennington* calamity has to be pushed still further back. Who was responsible for placing this young and incompetent officer in charge of the *Bennington's* engineering? Has the amalgamation of line and staff so depleted the numbers of competent engineers that the Department has no recourse except to entrust costly machinery and invaluable lives to ill-trained men? That is the large question which presses upon Secretary Bonaparte for inquiry and report; and unless and until it be seriously considered, the lesson of the *Bennington's* long list of dead will not have been taken to heart.

Assistant Secretary Loomis admits that he is to resign; but he adds that he is to "go abroad"—that is, to have a diplomatic appointment—or, at least, that he "hopes" to do so. The trifling formality of the President's acquiescing does not present itself to Mr. Loomis's mind as an obstacle. He is only concerned about the exact country where he is to be sent. It certainly ought to be a land where the people cannot read. Any nation whose citizens are able to understand the true bearings of Secretary Taft's report on Loomis could not but feel insulted to have such a man sent to it as minister. And possibly even President Roosevelt will at last get tired of hearing Mr. Loomis announce himself as indispensable to the public service.

President Roosevelt's recent exposition of the Monroe Doctrine at Chautauqua is received in South America with evident annoyance. The *Prensa*, an influential journal at Buenos Ayres, reflects the sentiments of the progressive, self-respecting republics in our Southern Hemisphere. Their feelings are similar to the indignation an honest, law-abiding citizen would express if he were notified to pay his debts by a roistering and fighting frequenter of the village tavern. Of the imaginary evil which the President mentions, viz., European interference in America, the *Prensa* quietly says there is "not the slightest danger." Nor does that journal fail to point out how far the Roosevelt formula departs from the Monroe Doctrine. "President Monroe only stated that the United States would not tolerate European territorial conquests, while Mr. Roosevelt assumes it to be a duty to compel South American nations to fulfil their obligations." These ungrateful South Americans also repudiate their ever having recognized the "Doctrine" in any guise, and this unilateral exposition of its contents they pronounce not only unwarranted, but humiliating to themselves. They even go so far as to say that the President's real motive is not so much to protect South America as to increase the prestige of this country as a World Power. Instead of seeing in the President's deliverance a guarantee of peace, they regard it as a menace. It is fortunate that Argentina is strong and stable enough to prevent her being the object of the "Doctrine's" activity. But some of the little cripples among the South American republics will get their ears boxed if they don't look out.

Lord Curzon's final resignation is an event of great significance both for India and for England. He breaks with the home Government on the great issue of civil control of the military. Lord Kitchener, like every general, thinks it irksome and intolerable that his plans should be passed upon by civilians. He wanted to enlarge the Indian army and make it ready to meet Russia on the Afghan frontier, and went over the Viceroy's head to the Secretary for India. That official, Mr. Brodrick, at first consented to give Lord Kitchener a free hand, but, upon the solemn protest of the India Government, accompanied by a threat of instant resignation from Lord Curzon, retreat was made, as usual, and a form of compromise patched up. Even this, however, Curzon now charges that the Balfour Ministry did not live up to honorably, and accordingly he throws up his office in disgust. This abrupt termination of so distinguished a service as Viceroy must cause a great shock of surprise and distrust in India, while in England it will be received with something like consternation. It is such a fine illustration of Balfour's contention that no one but the Tories can manage colonial and foreign affairs successfully! For so able a man as Balfour is, he seems to have a singular talent in repelling able lieutenants. One after another they have dropped away from him—Sir Michael Hicks-Beach, Lord George Hamilton, the Duke of Devonshire, Lord Milner, and now Lord Curzon—leaving him surrounded by a set of mediocre Ministers and administrators whom Lord Rosebery was not far wrong in calling a "series of transient, embarrassed, and, I may add, astonished phantoms."

As we surmised, Germany has an explanation of the "personal" loan by German bankers to the Sultan of Morocco, but it throws a comic light upon the character of that potentate. According to the story, he approached Germany with a demand for something very like blackmail. To be sure, he had agreed to an international conference for the purpose of regulating his affairs, but many of his proud subjects were rebelling at the notion of foreign interference, and, really, there was nothing to do but buy them off. Unfortunately, the Moroccan Treasury was low, the monarch's privy purse had not a piastre in it, and, therefore, if Germany would be so kind, etc. In this view, the German loan was simply a kind of righteous bribe to prepare for the great work of civilization in North Africa. But it was for this sort of thing that France and Germany were on the verge of war!

M. Yves Guyot, in a paper read before the Statistical Congress, revived the moribund "standard man" long enough to speculate about his consumption of food. Starting with the assumption that such a standard was to be found in the military or naval services, he compared the official rations with the average consumption of the civilian classes. The amazing difference which he discovered between these two totals, so far as France was concerned, led him to propound two alternative conclusions. Either the masses are starved in order that the army and navy may be well fed, or the soldiers and sailors are systematically overfed and pampered by the State. The similar comparison which he proposes for every country in the world would be a complicated matter, but it is easy to follow his reasoning in some of the familiar lines. For example, if we take a few of the agricultural products, which are necessarily used fresh, and therefore neither exported on any large scale nor stored from year to year, we can ascertain easily about what the *per-capita* ration should be. But it gives perplexing results. The 59 eggs a year of the average American old enough to eat eggs seem a meagre allowance, but the 390 quarts of milk uncommonly generous. One-third of a can of sweet corn a year is almost incredibly little, considering the apparently lavish use of this article of diet. But which of us eats 2¾ watermelons a year, the number that the census shows to be raised for every inhabitant more than five years old? Our civilian American does not seem, at any rate, to have so well balanced a bill of fare as the soldier.

A PREMIUM ON AGGRESSION.

"*Convey* the wise it call," and *indemnity* is as good a name as any other for the last booty to be wrung from the defeated. It is not the magnitude of the Japanese demand which the Russians resent, but the pretence; and their feeling will sooner or later be shared by all thinking men, and by nations not blind to the consequences of Russia's yielding this point in the negotiations for peace. M. de Martens had no difficulty, the other day, in exposing from historical examples the innovation now sought to be established as a part of international law. No precedent can be found for payment of an indemnity during a war still undecided, and still fought by the losing party on foreign soil. The case is really much as if Japan and the United States should come to blows in the Philippines—as may yet happen—and, on our being worsted and deprived of all but the last island of the archipelago, "indemnity" should be exacted over and above American evacuation. It is true that the islands are nominally American soil, but neither in fact nor in our national consciousness are they any more a part of the United States than Mantchuria is a part of Russia. We could relinquish them, indeed, with a profit, and would that we might. But to pay "indemnity" for their being taken from us, even for our own fault, with the war confined wholly to that distant scene and never directed against this continent, would rouse the old American sense of humor which Dewey and McKinley and Lodge and Roosevelt and Taft have nearly extinguished.

Russia, in other words, is not *in extremis*, is not hostilely occupied except on an insignificant margin, can spare for her steady national existence the fleets she has lost in Eastern waters, and comes to the conference as Japan in fact comes, to consider how best to end a drawn game. Both nations would gladly be spared any further expenditure of blood and treasure; and Japan could have been gratified if she had been content to have her victories confirmed, and had not aimed to make Russia pay all that her humiliation has cost her opponent. "Get out of here," said Japan with reference to Mantchuria and Korea, "that I may replace you." After Port Arthur, Liao-Yang, Mukden, and the naval overthrow in the Korean Straits, Russia stands ready to get out and to retire within her own boundaries. If Japan can extort other territorial concessions looking to her security against a repetition of clashing, well and good. To expect reimbursement for all her outlay in deliberately providing for this success, is either childish or monstrous.

Nor does it make for peace. "Indemnity" will, if secured, leave the new Russia as permanently hostile a neighbor as the old—and *popularly* hostile, as opposed to the greed of expansion in the ruling classes which brought on the present war. When we consider the Tsar's essentially peaceable disposition, we may feel assured that his consenting to a conference was an act of conscience fairly to be called national, in confession of the utter needlessness of the embroilment with Japan. It has been attended by the concession of the beginnings of self-government in his Empire, amid an awakened public consciousness full of hope if full of doubt, and ready to surge in any direction that will make manifest the new national spirit. "Indemnity" will reconcile the Russian people to a war thrust upon them by autocracy, and will give them their first sense of being really attacked by a foreign enemy. The ranks will be filled, the carnage will go on, tribute will not be paid. On the other hand, any adjustment short of tribute will find favor, and will bequeath no such rancor as to prevent the Russians and Japanese from being on good terms hereafter.

The indemnity extorted by the Germans in Paris was a guarantee of peace, no doubt; but peace in the sense of non-collision between the two countries. The true peace which results from neighborly regard and abandonment of ambitious designs, is yet far off. Have armaments been diminished on either side of the frontier? Might not the present relations between France and Germany be fitly described as a truce? The milliards were a penalty, moreover, for the Second Empire's having declared war, wickedly and groundlessly. The novelty of Japan's demand lies in the fact that she, no matter with what provocation, *began* the war, struck the first blow—struck it without warning, as a savage nation may do, and yet with the utmost deliberation, as a sequel to years of secret preparation. This is what other nations must face if they sanction it as a part of the international code. We know, of course, Japan's plea that her first blow was defensive, and the war a defensive war. So said the South when it fired upon Sumter. There is no richer field for casuistry than a defensive war. Napoleon III. used this pretext in declaring war against Prussia, which, after Sadowa, had grown too weighty for the European equilibrium. Any war can be so construed, by a Power desirous to pick a quarrel, and will be if the hard-and-fast line is not maintained between those who attack and those who repel.

Let the Japanese justify their pretensions of being champions of peace in the Orient. Grant that, by superiority in bloodshed on land and sea, they have established their claim to recognition among Christian nations by Christian Majesties and Presidents. Let them pose as the benefactors of Russia in having given to her outworn social fabric a shock that precipitates the dawn of freedom. But let them distinctly be told that all their pacific protestations are but cant so long as, having originally assaulted Russia, they press for "indemnity." This highhandedness is not going to be dropped by a military Power flushed with successes it dared not dream of, and provided (supposing she gets it) with millions of sweat money to be immediately put into fortifications, arms, and ships of war in *majorem gloriam Nippon*. Mankind will take warning.

RECIPROCITY AT CHICAGO.

The late reciprocity convention now in session at Chicago afforded a capital commentary on Secretary Shaw's recent tariff utterances in Virginia. The Secretary said that on the tariff issue the Republicans appeal to the producer with the promise of high prices for his products, while the Democrats appeal to the consumer with the guarantee of lowered cost of living. It could very conclusively be shown that the latter is the more fundamental consideration. The gathering of the Reciprocity Convention itself supplied the proof. For, while the policy of free trade or a revenue tariff is capable of reducing prices to all consumers alike by creating a more abundant supply of all articles of consumption, the protective policy, by creating an artificial scarcity of certain kinds of articles only, is of necessity a policy of discrimination. If it caused the same relative scarcity of all articles, what each producer gained in selling he would lose in buying. But in practice it makes some articles relatively more scarce than others, and thus it puts high prices into some producers' pockets, while it is incapable of helping other producers at all. The forgotten producer has begun to cry out, and thus the Secretary's creed proves not worthy of all acceptation, even among producers themselves. Of what avail is it to the wheat-grower, who must sell at the world's level of prices, to know that the sugar-grower gets, through the tariff, a higher price than could otherwise be had? How much ought it to console the shoe manufacturer, whose market is limited by the duty on hides and materials, that the iron baron or the wool-grower is being enriched by the tariff? The old tariff umbrella is not large enough to cover all producers—to say nothing of consumers—and the cry for reciprocity is a sign that those producers who are getting soaked want to come in out of the rain.

There are various kinds of reciprocity, whether secured by treaties granting mutual concessions or by the device of dual tariffs. Such a reciprocity arrangement as that secured by the Hawaiian sugar growers inured to the exclusive benefit of that island. They supplied only a part of our entire demand for

sugar. The price of the article was determined by the cost of the most expensive part of the supply imported. Reciprocity produced in this case no reduction in price to the American consumer. It also deprived the Treasury of millions of revenue. The benefit primarily went to the Hawaiian sugar planter. This is the type of reciprocity that the producer is ready to shout for. But opportunities of this kind are rare. Even if one were found, it could be taken advantage of only by giving some foreign country the analogous opportunity of collecting what is practically a bounty from our consumers.

On the other hand, where reciprocity is a mutual lowering of duties in competitive products which leads to both an enlarged market for producers and lower prices to consumers, it is doubly welcome. To be sure, its advantages are only a partial instalment, on a begrudged plan, of what free trade would give. It suffers also from injecting into the revenue-producing machinery an uncertainty of yield which a consistent tariff for revenue only would avoid. But small favors in tariff matters are thankfully received. The dread of the word "reciprocity" and the conjuring with the spirit of retaliation under the name of a "dual tariff" were both discreditable to the Chicago convention. The dual tariff, or the maximum and minimum system, means tariff wars as often as it does mutual concessions. Witness the late unhappy struggle between France and Italy. Until some method is found of getting something for nothing, the more hopeful way of obtaining relief from the tariff burdens is not to cringe to the tariff barons or the Trusts, but to smite them both under the fifth rib.

The speeches and resolves of the Chicago convention must be hailed as, on the whole, a blow at the feet of clay of the image before which the stand-patters grovel. Gov. Cummins bore emphatic testimony to the crimes committed in the name of protection—its senseless and selfish extremes of the present day being, as he said, enough to make the fathers of American protection stare and gasp. And the deliberate and formal utterance of this representative body of Republicans, as the great majority of them were, gives the lie direct to the complacent assertions of Dingleyites joined to their idols. It puts on record the fact that American industries "can no longer depend upon the home market"; that the export trade is "vital" to this country; that the present attitude of the United States is "antagonizing foreign nations whose good will we desire"; and that Congress ought at once to set about making "concessions" (polite for reductions) in our existing tariff which can be made "without injury to industry, trade, or the wages of labor."

All this is well, but the delegates, if they had looked closely, would have seen that a maximum and minimum tariff is, in intent and effect a threat. Buy from us, or we will hit you over the head. Now, commerce never thrives on anger. Getting a nation wrathful is the worst of all ways to make it take more of our goods. Look at the object-lesson writ large for us in the Chinese boycott. From the merely commercial point of view, the Chinese are foolish. They are glutting their passions at the expense of their own pockets. But does any such consideration ever deter an enraged people? Yet we propose, with the harmful effects on our trade of Chinese enmity visible to all the world, to go on and make better customers of France and Germany by first making them angry with us too! So far have we got from the sound philosophy and the commercial sanity and wise statesmanship of Sir Robert Peel, who said that the only effective way of meeting higher tariffs abroad was by lowering tariffs at home.

Furthermore, it is altogether probable that the real lords of the tariff think of this whole "dual-tariff" plan as merely one device more with which to stave off the demand for reducing duties and further to fool the revisionists. The latter have been fed on the east wind of "reciprocity" lo! these many years; now let them fatten on the equally filling diet of a dual tariff. Years may elapse before such a tariff can be got through; years more before it would ever be applied within the discretion of a protectionist President. In the meantime, the snugly ensconsed and reassured beneficiaries of the Dingley tariff will go on exacting the uttermost farthing from their fellow-countrymen, while almost giving away their goods to the foreigner. The plain truth is that the Home Market fanatics and the high and dry protectionists all around do not intend to yield anything whatever. Nothing can be got from them by fair words. They think themselves all-powerful in the Senate; they control the Republican party; they have intimidated President Roosevelt; so why should they be asked to give up one penny of the bounty they get under the name of protection? It is all very well for Chairman Payne out in Manila to talk pleasantly about lowering duties on Philippine goods; but the high priest of the stand-patters, Speaker Cannon, at once lets it be understood that nothing of the sort can be done, and that if Congressman Payne does not leave off his nonsense, he may find on his return that another man is to be at the head of the Ways and Means Committee. In a word, talk as they may about one resort or another to deceive tariff reformers, those who are enabled by the Dingley act to levy taxes upon the people have no notion of surrendering a particle of their private gain through public law.

Argument is wasted on unblushing greed. The case for tariff revision is overwhelming, but the only reply of the fortified protectionists is, "Well, what are you going to do about it?"

THE WOOL TARIFF ONCE MORE.

In the *Quarterly Journal of Economics* for August Mr. C. W. Wright publishes a paper on "Wool-Growing and the Tariff since 1890," which presents all needed facts and figures on the situation during the last fifteen years, and demonstrates once more that the duties on this raw material are both futile for aiding the wool-growing farmers and harmful in burdening the consumers. Mr. Wright sets forth his results in matter-of-fact terms, and in no way intimates whether he is a protectionist or free-trader. But his very moderation makes his conclusions the more convincing. He proves beyond doubt that the wool tariff has been powerless to prevent the decline of wool-growing in the heart of the country, and has not been necessary to bring about its advance in the trans-Missouri grazing regions.

The abrupt changes in the duties on wool under the Wilson and Dingley Tariff acts have served unintentionally as experiments to demonstrate these facts. The Wilson act, in 1894, put wool on the free list—the one radical and fearless change made by that Senate-manipulated measure. The Dingley act in 1897 restored the duties to the rates of 1890. Under the McKinley tariff we had a period of high duties from 1890 to 1894—virtually the same as through the whole preceding period from 1867 to 1890; then free wool from 1894 to 1897; then high duties again since 1897. The free-wool experiment of 1894-97 was not allowed to remain in operation long enough to work out its full results. It happened to coincide with the general depression that followed the crash of 1893, and so never was in effect under normal conditions. Time enough was not given for the manufacturers to accommodate themselves to the new conditions of freedom, and the full effects on manufacturers and consumers were never tested. But so far as wool-growing is concerned, some important facts were plainly established. In the first place, it appears that wool-growing in the agricultural region of the North—that is to say, anywhere from the Atlantic seaboard to the Missouri River—will be carried on to a certain extent without any duties at all, and, on the other hand, will not be stimulated beyond that extent even by the highest duties which the most fanatical protectionist has ventured to propose. When wool was admitted free in 1894, wool-growing in

this region declined. Part of this decline was doubtless due to the abolition of the duty. Part of it was due to the general business depression. At all events, the number of sheep fell sharply. In the North Central States (Ohio, Michigan, Wisconsin, Illinois, and adjacent States) the number fell from 12 millions in 1893 to 6½ millions in 1898. But—and this is the striking fact—high duties have not restored the number. In the North Central region there were in 1904 actually *fewer* sheep than in 1897; and the same is true of the other agricultural States, North and South. As Mr. Wright says: "There are now, after eight years under the duties of the Dingley tariff, fewer sheep than at any time throughout the period when wool was admitted free!"

The explanation is simple: the farmers find other things more profitable. Wheat, corn, cattle, the dairy pay better. Production in these has advanced; whereas, notwithstanding the stimulus of the tariff, wool-growing has declined. A certain number of sheep can be kept by the farmer virtually without expense, nay, with advantage to his land. Mutton grades of sheep pay best in this way; especially as, in recent years, fashion has increased the demand for those kinds of wool which come from the mutton sheep. But beyond the number which will thus be maintained, sheep-raising and wool-growing do not pay as well as wheat, corn, and cattle; and no tariff will help the case. As Mr. Wright says, the period of distress in the trying years 1893-97 taught the farmer this lesson thoroughly. Under the duties of the earlier period, before 1894, there had been brave attempts at sheep and wool, not merely as by-products of the farm, but as independent sources of profit. But the period of stress put an end to this, and the revised duties under the Dingley act have been absolutely without effect.

On the other hand, in the great grazing regions beyond the Missouri River—in the arid district where agriculture is impossible without irrigation, and where almost all of the land is suitable for ranching only—wool-growing is able to maintain itself without the tariff. Here, and here only, we have an independent sheep industry; not a by-product of general farming, but sheep (or cattle) as the sole products of the land. And here the number of sheep actually increased during the period of free wool! The number of sheep in the Northern Rocky Mountain region was 4,400,000 in 1893, and 6,300,000 in 1898; in the Southern Rocky Mountain region it was 7,200,000 in 1893, and 7,300,000 in 1898. In the Northern region there has been a further growth since 1898; the number of sheep being 11,600,000 in 1904. In the Southern region there has been neither growth nor decline; the number of sheep is now practically the same as in 1898. Montana is now the most prosperous of the sheep-growing States. There, sheep-ranching on free Government land pays. It would pay under any circumstances, as is proved by the steady increase during the period (1893-97) of free wool and business depression. It pays better, of course, when the price of wool is made higher by the tariff; but the tariff is not necessary for the maintenance or even the prosperity of wool-growing. It simply adds so much to the profits, ample in any case, of the sheep-ranchers.

In other words, with free wool, we should have no revolution in the industry. The farmers would continue to keep sheep very much as they do now—more for mutton than for wool—but without great change as to numbers. The ranching States would doubtless have less sheep than they have now; but the experience of the free-wool period shows that they can hold their own on a great scale without any tariff help. There would very likely be some shifting from sheep to cattle in the West, and pretty surely some cutting-down of the present high profit of the sheep-ranchers. The imports of wool would increase somewhat. They are already rising, even in face of the duties, for the country simply cannot produce enough wool for its consumption. With wool cheaper, cotton and shoddy would be used in less degree. One of the remarkable facts noted by Mr. Wright is the actual decline during recent years in the use of wool *per capita* in the United States; a clear consequence of the high price of wool. In sum, nobody would lose, except a small knot of trespassers on the public lands of the West; and the consumers would gain.

But—and here's the rub—the protective system would be deprived of one of its greatest shams. The wool duty is held forth as the shining example of benefit to the farmers; it stands for their share of the largesses of all-inclusive paternal care. That it is in fact practically of no consequence to them does not prevent it from being paraded and lauded and clung to. It enables the wool manufacturers to secure what *they* want in the way of duties, after granting to the growers what these are supposed to need; and it makes for cohesion in the whole protective scheme. It has no economic justification, but it has surprising political strength. It will probably hold its own for some time to come; and then—who knows?—will topple over with a crash, and bring with it a reconstruction of our whole tariff system.

FLURRIES OF REFORM.

"Senator Mitchell seems to have been a victim of one of the waves of reform which are now sweeping over the country." This explanation of the conviction of Senator John H. Mitchell of Oregon is offered by his counsel, John M. Thurston, formerly United States Senator from Nebraska. Mr. Thurston also asserts that, but for the statute of limitations, "many leading men in Montana and other Western States might have been company for Senator Mitchell in his trial." None can dispute the correctness of Senator Thurston's statement. In the West, eminent citizens, zealous in religion and politics, have abetted these land frauds with the same pride and enthusiasm with which, in the East, gentlemen of similar standing have joined swindling syndicates, and looted insurance companies. In fine, the illegal traffic, especially in timber and mineral lands, has been so lucrative as to be highly respectable. The common excuse for Mitchell, heard on the streets of Portland, Seattle, Tacoma, or wherever a friend volunteers to stand up for him, is that he is no worse than thousands of others. He suffers because his misdoings came to light at a time when people were excited about honesty. "Look at your sweet Depew," cries the Mitchell apologist; "he is Senator from the Vanderbilt railways; look at Dryden, Senator from the Prudential Insurance Company and the Public Service Corporation of New Jersey; look at the Pennsylvania Railway delegation in both branches of Congress, and then confess that your Eastern moralists are merely posturing when they condemn poor Mitchell for lending a friendly hand to the land companies."

Moreover, the great land companies, mining companies, and lumber companies are, like our blessed railway and insurance companies, substantial concerns, the backbone of business, controllers of many votes. "There is something to be said," remarked Mr. Thurston gravely, "for the big land companies of the West, in spite of the manner in which they are alleged to have procured their lands. These big land companies have been one of the principal factors in building up the Western country. Especially is this true of the lumber industry." The inference is easy, indeed obvious. The man who helps these beneficent institutions to get what they want, is a philanthropist. To call Senator Mitchell or Depew a hoary-headed old rascal is both unjust and cruel. Neither of them has inquired too harrowly into the technicalities of law or morals; their eyes have been fixed on higher things, nobler aims. Each has been devoted to those mighty commercial interests which are the true soul of a commonwealth; each in his own courageous, though somewhat careless, way has been an advance agent of prosperity.

To convict of crime, or even to censure severely, a man who has sacrificed whatever of conscience he ever had to the god of material success is, in these days, like stoning the prophets. And

yet a considerable number of us are in a mood to do just this. In the last two or three years, public sentiment has been deeply stirred, and men who call themselves practical are seriously asking whether wholesale debauchery of legislatures, boards of aldermen, and electorates is not too heavy a price even for so precious a boon as the largest insurance society on earth, the most extensive railway system, unlimited franchises for trolley lines, the most powerful lumber company, or the richest gold mine. The revelations of venality in Missouri, the uncovering of frauds in the postal service and in the Department of Agriculture, the scandal in regard to Justice Warren B. Hooker, the colossal knavery in the management of the Equitable, and the wide discussion of "tainted money" have set men to thinking that the Ten Commandments, though antiquated, may, after all, be a fairly safe guide in both politics and business; that in the long run dishonesty is not always the best policy. As Mr. Thurston naïvely puts it, "There is at present an epidemic of reform among the people of the United States, and their efforts appear directed toward men in the Government service." This, as Mr. Thurston generously admits, "is not to be condemned."

Neither is it to be accepted as evidence of a political millennium. Our citizens are somewhat stirred just now, but, as Mr. Thurston and Senator Mitchell are well aware, they will quiet down again. Patience to wait till a squall of reform has blown itself out is, as Senator Thomas C. Platt has more than once noted, a cardinal virtue in the politician who lives by graft. He and time can wear away the stoutest army that ever rallied to the banner of reform. The fact is significant that the conviction of Senator Mitchell was procured only with much difficulty; and, but for the firm backing of President Roosevelt, the prosecuting attorney, Mr. Heney, might have failed entirely. Apparently, the popular rage is fully satisfied with one "victim," for the jury has split in the case of Representative Williamson of Oregon. In our own virtuous State, public indignation did not remain at white heat long enough to melt the Odell machine, and as a result Warren B. Hooker is still an ornament of the bench. Observers at Washington predict a similar result in future trials of postal thieves. Machen and one or two notorious offenders are in the penitentiary; but the Government is already dropping the indictments of those against whom the evidence is not absolutely overwhelming. Possibly some of the worst of the rascals, if they can stave off trial long enough, will go free.

Nor is there any way, so far as experience teaches, to keep civic courage always screwed to the sticking-place. We must get along either with waves of reform, or with no reform at all. Human nature being what it is, the man who directly and immediately profits by dishonesty will be always alert, while the man who is robbed indirectly, secretly, and penny by penny, will inevitably suffer periods of apathy. Eternal vigilance is the price that will never be paid. Yet no one but a hired advocate can argue that spasmodic morality is worse than none; that because we do not catch all cut-throats and plunderers, we should let all of them off; that Senator Mitchell should not go to the penitentiary because Senator Depew remains a dishonored member of many directorates. To fall into this cheap fallacy would be deliberately to subvert every principle of decency.

THE GOSPEL OF EFFICIENCY.

Within a generation political philosophy has drifted from its traditional moorings. The reaction in this country has not proceeded to the same lengths as in Great Britain. We have not dragged our anchors so far, but, on the other hand, our democratic cables were supposedly stronger than those of an hereditary monarchy. Political reasoning, two or three decades ago, was colored by a dominant set of ideas which are to-day regarded as anything but axiomatic. The thinking of 1870 was permeated with certain assumptions about fundamental personal rights which are to-day viewed with confessed skepticism.

English Liberalism had thriven on the earlier food. It had rescued more than one submerged tract of personal liberty from the flood of private interests. It had extended the suffrage by insistence on the right of the individual to a share in government. "One man, one vote," was the goal it set before itself. It had broken down abuses and had abolished hoary privileges which transgressed the liberty of the individual. It had done away with the attempt to hold English-speaking colonies by force of arms. It had striven to destroy slavery and the slave trade in other states; and, if it retained sway over inferior races, it had aimed, on the whole, at a mild and tolerant rule. In the United States the principle of equality before the law was held with even more fervor. The war amendments to the Constitution show how far this doctrine was pushed. Not only was liberty given the slave, but the ballot was placed in his hand. Out of our full-hearted belief in the universality of these doctrines, we gave quick approval to movements abroad that seemed to promise political liberty or national independence. So strong was this genuine feeling that our politicians notoriously traded on it. Each party outbids the other in expressions of sympathy for Irish Home Rule.

To-day, all these political ideas are frost-bitten. If John Stuart Mill or Charles Sumner could return to this world, he would be simply bewildered by the radical change in political thinking. To talk of human rights as a political datum, or even as a political end, is supposed to-day to be the mark of a speculative Rip Van Winkle. It is not free government or self-government that holds the stage, but what is called "good government." Administrative efficiency, not a spontaneous national life with growth and movement, is the idol of the hour. "Even the vestal fire of justice is apt to flicker out in the ideal commonwealth of the efficient." Instead of abolishing slavery in its own colonies and aiding to break up the slave trade, "John Bull-Cohen," as the Australians dub their sire, is to-day importing coolie laborers into the Rand at the instance of the Rand shareholders. Instead of universal suffrage, he is preparing his sons for universal conscription. Instead of free trade, he is flirting with retaliation, reciprocity, fair trade, food duties, and protection.

The same spirit or tendency rules here. Does Porto Rico want to be self-governed and not governed from Washington? "Civic fibre," so the Rev. Lyman Abbott tells them, is not to come from self-government, but from large crops. What Porto Rico needs is not autonomy, but a good sewer system. If most Republicans would speak their minds out frankly today, they would admit that the disfranchisement of the negro in the South does not worry them. Lincoln was backward enough to believe that no man is good enough to rule over another without his consent; but Secretary Taft tells the Filipinos, "Work, don't agitate," for the United States will brook no interference for some generations. And if there has been a suspiciously long lull in expressions of sympathy for "the most distressful country," is it not because we are dimly conscious that we have an Ireland of our own in the Pacific?

Whatever the common causes of the reaction in both countries, we in the United States were doubtless beguiled through our sympathies. Our abhorrence of Spanish misrule in Cuba was taken advantage of by unscrupulous politicians to let loose upon us the curse of Imperialism. We were besought not to fear taking up foreign responsibilities through "the craven fear of being great." Not only our fine altruism, but our latent avarice, was appealed to. When we had acquired subjects abroad, we were no longer without sinister "national interests." Humanitarianism first slew its thousands, and then greed its tens of thousands. We took up "the white man's burden," and then, as Mr. Dooley said, "we put it on the coon." Powerful financial interests long defeated any tariff concessions to Cuba, and

have prevented justice to the Philippines.

All this change had not gone far when both in England and here a philosophic support was sought for in a distorted application of the doctrine of biological evolution to national politics. The old idea of righteousness exalting a nation was pronounced pure fustian. There was no test of fitness but survival. Success became the touchstone of international politics. The ape and tiger qualities have consequently been unmuzzled both here and in Great Britain. Forcible aggression and the maintenance of race ascendency have characterized the British policy of Imperialism since 1884. Preparations are here making for running a similar course as regards this hemisphere. In 1875 the naval and military expenditure of the United Kingdom absorbed less than one-third of the total expenditure; in 1904 it absorbed one-half, and had risen in absolute amount to £72,153,000. In the United States, $62,500,000 approximately was spent in 1875 on army and navy, or less than one-quarter of our Federal expenditure. In 1904 $218,000,000 approximately, or over 37 per cent. of our Federal expenditure, went for the same objects. The spirit of Imperialism is the same here and abroad. It means immense outlay, war not peace, privilege not equality. All the philosophic disguises that may be invented cannot conceal the facts.

SURVIVALS OF AMERICAN COMMUNISM.

Some months ago in Iowa legal proceedings were begun to end the corporate existence of the Amana Society, whose remarkable settlement on the Iowa River is believed to be the largest and strongest communistic society now in existence anywhere in the world. The District Court recently handed down a decision confirming the Society's rights in every particular. "It is undisputed," says Judge Byington in his opinion, "that the donation of personal property and personal labor and the holding of property in common is a fundamental tenet of this faith. Render this impossible, and you destroy the ability to observe their religious faith. Deprive the Society of the right to acquire and hold real estate out of which to make a living, and you deprive its members of the means with which to make a living." Therefore, in carrying on its various secular occupations, the Community of True Inspiration—its official name—is neither exceeding its corporate powers as a religious body nor doing anything "obnoxious to a sound public policy."

America has been the field for so many social experiments in the past that it would have been a pity on more than one account for any of them, however fantastic, to be terminated by force. The decision which allows the Amana Society to work out its own salvation for the future, ought at least to direct attention to the survivals of communism in this country. All told, there have probably been considerably more than a hundred attempts to establish communistic villages here, nearly all of them before 1850. John Humphrey Noyes, who founded the Oneida Community of Perfectionists in 1848, himself enumerated 47 previous failures. England gave us the Shakers, who established themselves in the East in 1794 and the West in 1808, and still flourish with about 1,000 members. Germany sent, besides the Amana colonists, the Zoarites and the Harmonites, or Rappists, whose membership had dwindled in 1900 to eight, and who sold their property to a Pittsburgh syndicate and dissolved in 1903. The French Colony of Icaria, in Iowa, went out of existence in 1895. The Oneida Community itself became in 1881 an ordinary joint-stock company. The Amana Society's long and successful life during a period when nearly all similar enterprises succumbed, is therefore a most interesting phenomenon.

The judicial decision already quoted summarizes the present status of the Society. It has about 1,750 members, owns 26,225 acres of land worth about $40 an acre, 5,386 acres being under cultivation. Its crops are worth annually something like $75,000; the product of its woollen and cotton mills, fanning mills, and blacksmith shops is valued at some $325,000 a year; and its live stock at present is reckoned at more than $70,000. There are seven villages on the Amana tract, with 280 dwellings, 51 barns, 4 hotels, 7 general stores, 3 drug stores, 7 blacksmith shops, worth altogether about $400,000. In every case where a comparison is possible, these figures show a decided gain over those given by Charles Nordhoff, who wrote an account of the community in 1875. The population, for instance, has risen from 1,450 to 1,750 in these thirty years. In this respect, the community is unique, for all the others described by Nordhoff, if they have survived at all, have suffered heavy losses.

It has been the paradox of communistic effort in this country that those who cared least about it have succeeded best at it. Of all the elaborate social reconstructions attempted by the disciples of Fourier and Robert Owen, not one succeeded. The last non-religious colony, Icaria, whose founder, Cabet, allowed fifty years for the peaceful conversion of the whole world to communism, perished itself only a few years after the expiration of that period. Not only have the sole survivors been religious societies, but they have been societies which made the communistic features of their life a matter of entirely secondary importance. Prof. Richard T. Ely, writing two years ago of the conditions at Amana, observed that "the ideas which underlie rational democratic communism have but little sympathy in them." He speaks further of the way in which "communistic practices spring up unconsciously without any thought of social transformation." Nordhoff also pointed out that the Inspirationists were brought together solely for religious reasons. Once united in a congregation and desiring to avoid contact with the rest of the world, their next question was to get a living. Since some members did not favor a purely agricultural community, factories or workshops had to be built, and capital for these enterprises was not to be had except by sinking all private means in a common fund. These people had no theories about it when one of their leaders, under inspiration, declared for communal ownership.

The religious side is in all respects first. The Amana Society's woollens and cotton prints have a high reputation, but as the Society does not believe in strife, legal or physical, outsiders counterfeit their marks unprosecuted. The extreme simplicity of their life does not arise from poverty. "One might have a flute but nothing more," Nordhoff was told when asked about their recreations. They live up so consistently to their beliefs about marriage, which is discouraged but not prohibited, that when any member, no matter how prominent, marries, he or she is at once reduced to the "children's order." Two of their early leaders, Christian Metz and Barbara Landman, dared to marry, and, like naval officers reduced so many numbers, had to win their way back to the top, in this case by giving renewed evidences of spirituality.

Even from external evidence it is manifest that the residents at Amana do not rank social doctrines with religious. For instance, there is no effort to make the colony completely self-sustaining, like one of Fourier's phalanxes. What the Society does not itself produce, it buys freely from outside. It sends its physicians to college, and even abroad, to be educated, and, while they must give their services to members, it permits them to take paying patients outside. If a man has honey or vegetables to spare, his selling them for pocket money is winked at. Even the credits at the Society stores, arranged somewhat on the Bellamy system, are not uniform; certain members, like these same doctors, receiving $100 a year, while some of their neighbors, whose legitimate wants are conceived to be less, get as little as $40.

There is the best of object-lessons in all this of the way in which human institutions actually grow up. Everywhere, in the second quarter of the last century, were enthusiasts who knew exactly how society should be reorganized,

who not only could draw unimpeachable plans to the last detail, but were willing to sacrifice everything, and even suffer persecution, to see them in practice. One and all, these visionaries made abject and humiliating failures. But a dissenting sect of German immigrants, caring nothing about industrial problems and asking only to be let alone, comes across the water and blunders into striking success in the same field.

THE PLÉBISCITE OF THE NORSEMEN.

KRISTIANIA, August 5, 1905.

Norway is just now in a state of patriotic eruption more interesting to the seasoned traveller than even its fjords and glaciers. After the momentous action taken by the Storthing on the 7th of June, it was freely charged by Swedish writers that the sudden dissolution of the Union was the work of self-seeking lawyers who misrepresented their country. It is thus not surprising that the Riksdag insisted upon a decisive popular vote in Norway as the first condition of negotiations looking toward a formal recognition of the Union's defunctness. The Storthing has promptly accepted the challenge, largely in deference to the opinions of mankind at large, and has fixed upon the 13th of August as the day on which the electorate shall vote aye or no on the simple question of approving or disapproving what was done on the 7th of June. Thus is democracy vindicated in one of its strongholds.

In view of the uncertainties that beset prophecy, especially in the field of politics, it might perhaps seem more prudent were I to wait until the vote has been taken before writing a letter about it to the *Nation*. However, my object in writing is not to discuss the vote itself, but to offer a judicial comment upon the recent developments on which the plébiscite of Sunday week—already marked as henceforth a red-letter day in the Norseman's political calendar—will set the high seal of popular approval. For the only element of uncertainty in the horoscope is the size of the vote that can be brought to the polls. The middle of August is not a very good time for polling the people of Norway. Many of the well-to-do are away from home, fishermen and sailors are on the sea, herdsmen far up the mountains. Moreover, some evidently look upon the whole affair as a useless formality. But vigorous efforts are being made to bring out the vote, the papers are printing strong appeals, the chairmen of all the party organizations have united in a common address to the people, the women are making themselves heard, and the result will no doubt be decisive enough. It will tell the world what the Norsemen think about the main issue of the dead Union. It will show a virtually unanimous support of the Storthing and the Michelsen Government. For several weeks I have been reading papers of every stripe, and talking with people of all stations, and I have yet to find a real dissenter.

There are, indeed, many whose mood is anything but exultant, and who regret keenly that a satisfactory union with Sweden, on the basis of a complete sovereignty provided by the Constitution, could not have been effected. They do not like to think of little Norway standing alone against any of the great Powers that might cast a covetous eye upon it. Suspicion of Russia is bred in the Norseman's bone, as in that of the Swede. He really wishes to live on terms of amity and alliance with his brethren at the east, but he is firmly resolved not to live in a relation of dependence. He feels no bitterness toward the Swedish people, though he sharply criticises the dominant party in the Riksdag. No rancor is felt toward King Oscar, though regret is freely expressed that he should not have seen fit to spend more time in Norway. (The Constitution provides rather vaguely that the King "spends some time each year in Norway, unless serious obstacles prevent.") But all parties, from the Socialists to the extreme Right, are now agreed that the work of June 7 must not and shall not be undone.

On the whole, the dominant impression produced on my own mind—the mind of a bookish outsider who has long had a warm feeling for all three of the Scandinavian peoples—by the recent reading of numberless pamphlets, leading articles, open letters, and so forth, is one of admiration for the superb poise exhibited by the Norsemen under very trying circumstances. By a section of the Swedish press, that called *Stor-Svensk*, or Great-Swedish, which is the local name for Jingo, they have been deluged with abuse. Even by writers of repute, from whom one would expect a more calm and objective view of the matters in dispute, they have heard their public men, whom they trust and admire, denounced as traitors, rebels, madmen, and wretches dead to all sense of honor. They have read blustering talk of war and wild rumors of military preparation on the part of Norway. But thus far I have met with no venomous retort by a Norseman—nothing that could fairly be called bad-tempered. Their leaders are calm and conciliatory—the importance of future friendship is kept steadily in mind; but the calm is that of men who have come to a decision, and are prepared to stand by it. Among the derisive epithets hurled at them by the bellicose party in Sweden is one which means "fussy," but there is no fussiness discernible in their present temper. What one reads and hears everywhere is a quiet determination that the Union as it has been shall be no longer. This granted, the Norseman is ready to discuss all other questions in a tractable and conciliatory spirit.

As I write, there lies before me a little pamphlet consisting of five articles that have lately appeared in the Kristiania *Aftenpost*. One is by an ex-Councillor of State, another by a university professor, a third by a venerable clergyman, a fourth by an officer in the army, and the last by a prominent jurist. The clergyman's contribution takes the form of a short open letter to Swedish Christians. After speaking of the high hopes that thrilled the hearts of all Norsemen in 1903, when there seemed a fair prospect that the claims of Norway would at last be granted, he goes on to say:

"I know that many of you think we gave up hope too quickly; very well—I speak confidently and with full assurance—then forgive us the supposed wrong. Understand us and forgive us. Understand, you Swedish pastors, who love your country so ardently, as is now being made evident, that it is from great love to *our* country that we have acted, in doing what before God we believe to be right. . . . I do not wish to write much, but I wish to write from heart to heart. Let me close with these words: Give up the desire to rule over us, and you shall come to own us. Offer us again a brother's hand after the dissolution of the Union, and you shall have no more faithful friend than Norway. It is not in fear of war that I write—every drop of Norse blood is ready to be shed if we are attacked; not in fear of war, but in fear of the awful loss of things precious, especially of love between the two peoples of the peninsula. For we love Sweden and its people. You should know that. We love you in spite of your hard words, because we see through the words to the high heart of the Swedish people."

The officer writes an open letter to Swedish friends and comrades. After rehearsing the events that led up to the separation, he comes to the question of "honor," always a ticklish one for the military mind. "How," he asks, "can the honor of the King or of Sweden be hurt by the dissolution of an equal partnership, which one of the partners had found unsatisfactory?" He continues:

"We offered you our hand in sincerity, but you did not take it. We offer it again and ask for your friendship—not from fear—for we trust fully and firmly in the goodness of our cause, and rely confidently on that higher justice that rules the fate of men and nations; but because, as I have said before, we sincerely desire peace and good relations for the sake of the welfare and progress of both nations. Give us your hand and do it quickly, before the poison which is being spat out by small and short-sighted men shall penetrate to the heart and destroy our kindly feeling for your land and people and yours for us. To conclude: Believe what you will about us, but do not believe that we are so stupid as to make, under any circumstances whatever, an attack upon Sweden. But, if we are attacked, we shall defend ourselves as long as there is an arm in Norway that can handle a weapon, or a silver spoon that can be turned into money."

With such sentiments as this the press of Norway has of late been ringing. They represent beyond a doubt the feeling of the country. And, this being so very evident, how astounding it is to find in the Stockholm *Dagblad* such a deliverence as the following:

"Can it really be possible that there is one single Norseman who regards Norway's cause as just and could go to war with Sweden in honest faith that it is so? Of course the Norsemen are being misled and blinded by their independent professional politicians; but that they should be so to such a degree that they can seriously look upon their cause against Sweden as just, is quite too preposterous."

Or take the following, as a pendent to the clergyman's utterance quoted above. It is again from the Stockholm *Dagblad*, and emanates from an aged Swedish professor who is expostulating from the brink of the grave, he says, with his erring Christian brothers in Norway:

"Have we here in Sweden ever learned to regard Norway as a dependency? Or have the Norse youth been brought up in that belief? Has not Norway enjoyed a domestic freedom greater than that of almost any other country in Europe? Compare it with what Finland has endured. Can the trifling and for the most part purely formal limitations in the sphere of foreign affairs prove that Norway has been a dependency? . . . What a small thing is this consular question! Has there ever really been anything to complain of? . . . And then it is not unreasonable that the older brother in a family should have a

little the best of it, at any rate until the younger brother is full-grown."

These words show better than pages of learned exposition the nature of the causes that have produced the rupture between Sweden and Norway. Here is a Swedish gentleman, of high culture and the best intentions, making a most laudable effort to be fair, and—using language fit to make a Norseman clench his fist and tear his hair; comparing Norway with Finland, and implying that its freedom is the generous gift of Sweden; speaking of its foreign affairs as a trifling matter, and likening it to a little brother that needs to be managed until he is full-grown. And all this after solemn assurances that nobody in Sweden thinks or wishes to think of Norway as a dependency! The fact is, that the great majority of the Swedes, and especially those who take part in public affairs, do look and always have looked upon Norway as a sort of appendix to Sweden (I purposely avoid the use of a technical word). In the beginning they regarded it as an offset for the loss of Finland, a legitimate prize won by war and diplomacy. It was not legally a part of Sweden, but was thought of as a sort of autonomous province which chose to call itself a kingdom, and which it was expedient to let go its own way on account of the extreme touchiness of the Norsemen in matters of form. And this mode of thinking is so ingrained in the mind of the Swede that it has become as "natural" as the air that he breathes. He cannot understand why it should be so offensive to the Norseman.

Thus only can we account for the extreme heat of such a writer as Sven Hedin, who has an eminently scientific mind and is honored by all the world as an explorer. In an article recently contributed to the German periodical *Die Woche* he speaks of the Storthing's action as illegal, revolutionary, and horribly insulting to the aged and excellent King Oscar; of a long-desired sovereignty now finally won by seditious and unlawful means; of an epidemic madness that has seized upon an entire people, misled by a government of lawyers. And he is in great concern, not for the dignity and honor of Sweden, which has behaved so ideally during the crisis, but for poor little Norway drifting hereafter alone before wind and weather!

It is clear that such deep-lying differences of opinion as I have brought to view, with regard to the nature of the union between the two states, were no longer to be reconciled or patched up by compromise. It was necessary that the one side yield to the other, peaceably or under compulsion of defeat in war, or else that the Union be dissolved. For the Norseman repudiates the idea that he has been scheming to secure anything that was not his plain right under the law, or that he has been for years engaged, to quote a phrase of Hedin's, in "chasing the soap-bubble of sovereignty." He calls attention to the fact that Norway was a free and independent kingdom for some centuries before anything trustworthy is known of Swedish history; and to the fact that, in theory at least, it has never been anything else. He admits ruefully that, during the long Danish connection, owing to the temporary decadence of national spirit, the theory was reduced to a barren ideality; but he insists that the basis of the union with Sweden is not the ancient history of Norway, but the act of Union and the Constitution of 1814, the first sentence of which reads: "The kingdom of Norway is a free, independent, indivisible, and inalienable realm, united with Sweden under one king." He asserts that what he has aimed at in recent years was by no means the destruction of the Union, but the effectuation of a union such as the fundamental law of the land provides for. He declares, further, that if there was revolution in the proceedings of June 7, it was not of his making.

And up to a certain point it is difficult to evade his logic. Stated as briefly and unquestionably as possible, the course of the "revolution" was as follows: In May last a consular bill in which the country was well known to be greatly interested was passed by the Storthing and laid before the King by his Council of State, who were unanimous in its favor. The King vetoed it, as he had an unquestioned right to do. The Constitution provides that a vetoed bill shall be returned, and, if passed without change by three successive Storthings, it becomes a law notwithstanding the veto. Upon failing to secure the King's approval of their bill, the Government resigned, which was the natural and regular and indeed the only constitutional course for them to pursue. To have retained office under the circumstances would have been absurd and in a sense revolutionary, since the effect would have been to convert a constitutional Government into an absolute monarchy. At this stage of affairs the "regular" procedure would have been for the King to accept the resignation of his Council and form a new ministry that would take the responsibility of dropping the proposed bill. But no such men were to be found in Norway, as King Oscar well knew. So he declined to attempt the formation of a new Council or to accept the resignations of the old one. Thus government in Norway was brought to a standstill; wherefore the Parliament, as the ultimate source of authority in a free country, declared the throne vacant and proclaimed a provisional Government.

One sees that there is room for endless logomachy over the question, Who broke up the Union? There is surely much force in the contention of the Norsemen that the responsibility for the "revolution" rests not upon them, but upon the King and his Swedish councillors, who sought to prevent a free and independent people from managing their own affairs in their own way. To the charge of precipitation and of having deliberately planned the *impasse*, they reply that the question at issue was no new one; that for many years they had endeavored in good faith, by means of negotiations between the two Governments, to secure a mutually satisfactory consular law by which they could guard the separate interests of Norway, as the separate interests of Sweden have always been guarded by its consuls; that they had seen their efforts year after year thwarted by the Swedish politicians, until patience had ceased to be a virtue and become the sign of servility. It was necessary to bring matters to an issue or else to accept the hateful status of a dependency.

For the Swedish side of the controversy it is urged that, in the absence of explicit law either in the Constitution or in the Act of Union, the foreign affairs of Norway, and with them its consular business, were from the first left in the hands of the King, to be managed at his good pleasure; the theory being, of course, that if the Union was to be effective as against a foreign enemy, a division of authority in the conduct of foreign affairs was inexpedient. The Swede asks impatiently why an arrangement which was acquiesced in by Norway for some seventy years, and thus acquired something of the sanctity of law, should suddenly have become intolerable. To this the Norsemen are ready with their reply along two lines of argument. First, they say that their long acquiescence was a matter of convenience and of understanding with the King in his capacity as King of Norway, bound to take the advice of his Norse Council of State; that it was never in any sense an agreement or even an understanding with the Swedish Government; that in recent years, owing partly to changes in Swedish organic law, about which of course the Norsemen were not consulted, it has come about that the King, in his conduct of the foreign affairs of both countries, takes only the advice of his Swedish Council of State, which is in no way responsible to the people of Norway. Of this the Norseman justly complains. His second line of argument is that commercial conditions have greatly changed; that whereas half a century ago the consular question was of small importance, in recent years the foreign commerce of Norway has increased until it is about three times as great as that of Sweden; that the policy of the two countries as regards tariff on imports is very different, and that they have become to some extent competitors in the world's markets. The Norsemen say that, under such circumstances, the continued control of their consular business by their commercial rivals is intolerable and unworthy of a free people. Such a state of affairs, they declare, even if they should patiently submit to it a little longer, must inevitably be a constant source of ill-feeling between the two countries and hence an ever-present danger to the Union.

Summing it all up, I can see nothing but blindness and fatuity in those Swedish writers who treat the Norseman's consular question as a trifling matter and call him "fussy" for caring so much about it. They forget that, in political history, where the patriotic instinct is concerned, the great questions are usually trifles that happen to be symbolical. One thinks of the tea in Boston harbor, for example. The Norseman's national feeling is strong, and he has the same right to it that other people have to theirs. His value as a friend and ally of Sweden can not be increased by wounding his patriotism. To me it seems clear that, owing to the course of events and to radically different constructions of organic law not in itself explicit, the Union had become unworkable and a source of danger and weakness instead of strength. The well-wisher of both peoples may cheerfully say, Peace to its ashes!

But what of the future? one asks. Well, there are certainly hard problems enough in sight, but there is also a good prospect that they will be solved without a resort to arms. Sensible men in Sweden see plainly, through their wrath and regrets, that a war with Norway would be criminal madness. It would serve no purposes but

those of the arch-fiend. So there will be no war. There will be difficult, perhaps tedious, negotiations over the settlement of counts, over the tariff and what not. On all these matters the Norsemen will be very conciliatory and careful of Swedish susceptibility. In the end there will be a defensive alliance between two very friendly peoples, who will understand each other better and respect each other more than they have done hitherto. And as for the bugaboo of danger from without, one may predict with confidence that much water will run into the sea before the Muscovite bear, henceforth a sadder and wiser bear than we have been wont to think of, will be eager to lay his paw upon either Sweden or Norway. CALVIN THOMAS.

AN ARCHITECTURAL STROLL IN FRANCE.—II.

PARIS, August 7, 1905.

The reader of 'À travers la France,' by M. André Hallays, will not regret following him in his excursions, and will find many interesting pages, not only on historical monuments, but also on historical characters. On his way through Montbard, in Burgundy, he is forcibly reminded of Buffon. There are not many people, I am afraid, who now read Buffon's 'Histoire Naturelle' or his 'Discours sur le Style.' There are, however, in the 'Histoire Naturelle' many admirable descriptions; all that is remembered of the 'Discours sur le Style' is the proverbial maxim, "Le style c'est l'homme." M. Hallays says that, "of all Buffon's works, the one which has preserved all its beauty, all its life, all its freshness, is the park at Montbard; so much so, that there are probably more travellers bent on admiring these old trees than there are readers for the old works of the naturalist.

Buffon bought in 1744 the castle of Montbard. It was an ancient fortress which had often been inhabited by the Dukes of Burgundy. Buffon demolished the feudal castle, with the exception of a half-ruined tower where he had his "cabinet de travail," and a formidable donjon. He kept also the fortifications which surrounded the hill on all sides, and transformed them into terraces, on which he planted trees. "The gardens," writes in 1785 a visitor (Hérault de Séchelles, who became one of the Terrorists of the Convention), "are composed of thirteen terraces, as irregular as the house, from which one discovers an immense view, magnificent prospects, meadows, rivers, hills, and the whole town of Montbard." The park, which was bought by the town, is now a public promenade. There are no longer gardens in it, but the trees are admirable. At the foot of the donjon there is a column erected by Buffon's son with this inscription:

Excelsæ turri
Humilis columna
Parenti suo
Filius Buffon
1785.

This son of Buffon was an officer, married to Mademoiselle de Cepoy, and divorced from her. Madame de Buffon became the mistress of the Duke of Orleans (Philippe Égalité). She was a rival of Mrs. Elliott, who was a Conservative, whereas Madame de Buffon was a partisan of the Revolution. The interesting Memoirs of Mrs. Elliott enter into curious details on this subject.

Montbard has a statue of Buffon, and another of Daubenton, his collaborator. Émile Montégut, in his 'Souvenirs de Bourgogne,' a work which cannot be too highly commended, has judged the statue of Buffon in these terms: "This man in bronze is a naturalist? He might as well be an orator, a provincial *intendant*, a politician. Where do we find in this image a sign, a mark, which indicates the nature of the intellectual occupations, the services rendered, the glory acquired?" This criticism had its effect; round the statue of Daubenton the sculptor placed three sheep.

M. André Hallays took with him to Montbard, to read there, a forgotten opuscule, 'Le Voyage à Montbard,' by Hérault de Séchelles. Sainte-Beuve says of him that he was "a light, unfaithful, and ironical spy." M. André Hallays calls him the first of the reporters. He was, at the time of his visit to Buffon, advocate-general at the Parlement, though he was only twenty years old. Hérault de Séchelles gives an account of his visit to Buffon which is very much in the style of the articles of our modern reporters. What can be noted in it now is the portrait he gives of the great man: "I see a fine face, noble and calm. Though he is seventy-eight years old, you would only give him sixty; and he had just passed sixteen nights without sleep [he was suffering from the stone]. . . . His hair was curled when I saw him; it is one of his manias, and he confesses it. . . . He had on a yellow dressing-gown, with white stripes and blue flowers." Hérault de Séchelles notes with care Buffon's passion for fine clothes, and all the habits of this "good, great man"; but, with all his show of admiration, he insists too much on the naturalist's little ridiculousnesses.

Very different from the worthy and, on the whole, admirable Buffon was Bussy-Rabutin, whose famous château next received a visit from M. Hallays. Rabutin's rivulet flows at the foot of Mount Auxois, the *Alesia* of Vercingetorix and the scene of his last stand against Cæsar. Bussy-Rabutin wrote to his friends that his house was one of the finest in France; which was going beyond the truth. The principal part, in pure Louis XIV. style, was built in 1649 by the Count de Bussy. There are, as usual, two wings, making with the middle part a court of honor. These wings, formed by arcades, are the remains of a château of the Rennaissance. Four towers, which are at the four angles, give the whole a feudal aspect. The park is built on a slope, and great stone staircases, marble vases, and rocks impart to it a grand character. On one side of the château is an elegant parterre, which is said to have been planned by Lenôtre; but, says M. André Hallays, "What French garden has not been attributed to Lenôtre?"

Roger Rabutin, Count de Bussy, having fallen into disgrace with Louis XIV., was ordered to retire to his estates. He was only forty-six years old. He was a most brilliant officer, and had served with great distinction under Turenne and Condé. He once, with an armed band, abducted Madame de Miramion, whom he wished to marry; and was saved on this occasion only by Condé. He caused great scandal in a famous orgy at Roissy, where, with other libertines, he sang very scurrilous songs. He afterwards composed the 'Histoire Amoureuse des Gaules,' in which the great ladies of the court, Madame de Maintenon among the rest, were libelled. He was sent to the Bastille, and, his health giving way, was allowed to go to Burgundy.

His château was in reality his prison, and he consoled himself only by adorning it, and by writing innumerable letters, which are models of style, and many of which have been preserved and are still very readable. Under his direction, painters decorated the walls of the château with allegories and devices, which are, so to speak, the history of his amours, his regrets, his likes, and dislikes. It was the custom of the seventeenth century to have on the panels illustrated devices; among all those made by Bussy's orders—the phœnix, the torn flag, etc.—there is a fine portrait of the Count by Lebrun. The devices were chosen with care. "Decipit et placet," "Allicit ut perdat," etc. Many are the allusions to Madame de Montglat, who was Bussy's goddess, and about whom he wrote to Madame de Scudéry: "You see that I love much the lady concerning whom I cannot be silent; I confess it, provided I may speak of it. I don't care what people think of it, but I will speak of her in prose and in verse." One of the towers, the gilt tower, as Bussy called it, was specially dedicated to Madame de Montglat. Her portrait is there, with the portraits of the ladies of the times most celebrated for their adventures—the sisters D'Angenne, Madame de Gouville, the Duchess of Châtillon, the Duchess of Choiseul, the Marquise de la Baume, the Marquise d'Humières. There are also many mythological pictures, with verses and maxims in verse inscribed under them, which compose a sort of "art d'aimer."

Count Sarcus, a proprietor of the château, preserved all the remains of the park, and dedicated a room to the memory of Bussy's famous cousin, Madame de Sévigné. He placed in this room a series of female portraits, executed by Bussy's order. Madame de Sévigné was always fond of her witty cousin; her letters to him are charming, and the manner in which he introduced her in his 'Histoire Amoureuse des Gaules,' is one of the greatest reproaches that can be brought against his memory. M. André Hallays very justly writes: "This Bussy had probably in his person, in his manners, perhaps in his voice, something which seduced and disarmed. He was wicked and treacherous; but people came back to him. He did to Madame de Sévigné the most cruel and cowardly injury by putting her portrait in the 'Histoire Amoureuse': it is the most perfect and the vilest page he ever wrote." She was very angry with him, but, after an explanation, she forgave him. So did not Louis XIV., who would never again give Bussy a place in his armies.

We must follow M. André Hallays to many places in his rambling tours. Let us stop a moment with him at Avignon. It is resolved, it seems, to demolish Avignon stone by stone: "Among all the old cities of France, there is none which more deserves the respect and the affection of its inhabitants. . . . On a marvellous site, under an incomparable sky, its palaces, its ramparts, its churches tell us the brilliant past of the little pontifical republic, which,

from the 14th century to the French Revolution, lived wealthy and free." Avignon possesses admirable works of art of all periods: the tomb of John XXII., in ogival style; the former *rétable* of the Celestins, a marvel of Renaissance style; the Hôtel Crillon, and the chapel of the Black Penitents, which belong to the 17th century; the chapel of the Virgin of Saint-Agricol, and the rooms of the Hôtel Villeneuve-Martignan, in the best style of the Provençal 18th century. Avignon has frescoes by Simone Memmi; pictures by Mignard and Parrocel; sculpture by Bernus and Peru. "But," insists M. André Hallays, "the original beauty of Avignon is its girdle of walls which Stendhal has described with admiration." The mayor of Avignon has formed a project to demolish them, and M. André Hallays has begun a campaign against this project. These beautiful walls have been saved once already, at the time when the Paris-Lyons-Marseilles Railroad was constructed; it is to be hoped that they will be saved again. If they are sacrificed, even in part, to the spirit of modern so-called improvements, it will not be the fault of the ardent and passionate lover of the past whose work we have read with the greatest interest.

Correspondence.

AMERICAN CONSULAR AGENTS.

To the Editor of The Nation:

Sir: As an American Consular Agent and a subscriber to the *Nation*, who recognizes its reputation for fairmindedness, permit me to suggest that, in your editorial of July 27, you may be doing Mr. Dolge serious injustice.

All Consular Agents are permitted and expected to engage in trade. They are not Consuls in the strict sense of the word, but correspond to the Trading Vice-Consuls of the English service. They have no fixed salary, may not communicate direct with the Department of State, and are responsible to the Government only through the Consul or Consul-General in whose district they act. A Consular Agent is, in fact, simply the agent of his superior officer, appointed for the convenience of merchants and travellers, to a post within the district of the principal Consulate, but usually at some distance from it. His compensation is one-half the official fees paid into the agency per year, unless the total of such fees exceeds $2,000, in which case the surplus is turned into the Treasury. He also retains such fees as he may receive when acting in a notarial capacity. He is not entitled to any office allowance, furniture, or even stationery.

In nearly every case the Consular Agent is a trader who, for the sake of the fees he may or may not receive, and for the slight prestige which always accompanies an official position of any sort, has volunteered to act as a Consular officer. Such a Consular Agent is not indebted to his official position for his commercial prosperity, but, on the contrary, often owes his official position to his business standing. This privilege to engage in trade which the Government extends to Consular Agents, is not only not regrettable, but, under existing conditions, desirable and even necessary. By it the Department of State is able to maintain, without aid from the Treasury, 387 Consular Agencies scattered throughout the world, while the Consulates and Consulates-General in regular standing number only 331.

For the purpose for which Mr. Dolge was named Consular Agent at Caracas, it is a matter of minor importance whether he conducts his official business in the office of his laundry or elsewhere. His nationality doubtless had something to do with his appointment, since, although most Consular Agents are foreigners, the Department of State selects Americans whenever possible. The Consular Agency at Caracas is one of the four over which the Consulate at La Guaira has control. For the year ending June 30, 1904, the official fees amounted to $783, half of which went to Mr. Dolge as his compensation for the year. There were no notarial fees. Mr. Dolge received his nomination in 1904, while Mr. Bowen succeeded Mr. Loomis as Minister to Venezuela in 1901. M.

SWEETS AND BOOKS.

To the Editor of The Nation:

Sir: A book called 'The Candy-Maker,' published in New York city, tells us how a taste for ice cream can often be developed in a community where perhaps it had been before unknown. One might ask himself a similar question: How to develop a taste for good literature? I have no suggestion to offer, but, as I am a foreigner and spent my childhood days abroad, it is possible that some of my observations will be of interest to Americans.

I have sat hours in a variety store in New England, watching the children buying candy, but, although my observations run through a long period of years, I cannot remember a single case of a child asking for a book. It is true that they keep only dime novels in such a store, but the storekeeper has always a memorandum-book in which he notes the articles for which there is a demand if they happen not to be in his store. A German lady who spent forty years in this country would often ask me, after a visit to an American friend of hers, What do they do in their bookless house? Now when I was a boy abroad, we often spent our pin money on regular study-books, such as in chemistry or in botany, or a grammar of a foreign language, etc. A short time ago I procured a Botany of a certain region, and immediately recognized it as the same one I bought while a child. What pleasant memories it recalled! I fancied myself standing again before a *Parnassia palustris* or an *Epilobium angustifolium* with that self-same book in my hand. Verily, I say unto you, I derived as much pleasure from it as an American boy from swallowing his candy. I still follow the same pursuit, and am as unable as ever to answer the usual question, what is my object in doing it.

εἰς τὸν λειμῶνα καθίσας
ἕδρεπεν ἕτερον ἐφ' ἑτέρῳ αἱρόμενος
ἄγρευμ' ἀνθέων ἡδομένᾳ ψυχῇ,
τὸ νήπιον ἄπληστον ἔχων.

One of my chums bought on a similar occasion a copy of Virgil in Latin and learned it by heart. I have known people doubt a similar trait told about Euler. *Infer digitum tuum huc et noli esse incredulus, sed fidelis.* How many times I saw him, when asked to translate a passage in Virgil, take any book which happened to be at hand—an Algebra or a Physics—and translate from it his lesson in Virgil. Books in physics and chemistry were bought by the score, and the experiments described therein performed. While rummaging through the library of a teacher in a normal school in this country, I found as a rule only old books—a heirloom from her parents; and when a new book came to light, a card was sure to fall out from it indicating that it was a present from a friend. How often does one in this country encounter an elderly gentleman reading a book? I have often seen a former teacher taking a book out of her husband's hand, simply because, to her mind, it was an indication that he was growing childish. It is so seldom that one meets here a person who likes reading books that I do not wonder at my New England landlady telling me some time ago that I was nothing but a book. But I am afraid I have said enough already to arouse the anger of the Agrigentines, so that it is time to put a stop.

Πότερα θέλεις σοι μαλθακὰ ψευδῆ λέγω,
ἢ σκληρ' ἀληθῆ;
Ἀτὰρ σιωπᾶν τά γε δίκαι' οὐ χρή ποτε.

Yours very respectfully,

O. T.

August 18, 1905.

THE VIRGINIA JOURNALS.

To the Editor of The Nation:

Sir: I thank you for your kind mention of the Journals of the Virginia House of Burgesses, which appears in the issue of the *Nation* of August 17. We are exceedingly grateful to you for this compliment, which will add much to the interest of the book, both at home and abroad.

One matter I should like to call your attention to is the statement that the "letters from Alexandria, Dumfries, Williamsburg, Fredericksburg and Baltimore are not to be found in the volume of the Journals." These letters were resolutions of similar committees at the points in question, and do not form part of the work of the Committee of Correspondence of Virginia. There are numerous letters of this kind and resolutions from other points throughout the Colonies that were forwarded from time to time, and it was apparently the duty of the consignee to forward such papers as fell into his hands to the nearest point where any interest was shown in the work of such committees. A number of these letters are here in this Library, from Boston, Philadelphia, Annapolis, and other places, not addressed to the Committee of Correspondence of Virginia, but simply enclosed as evidence of action at the points in question. The Calendar of State Papers contains four or five of these, and excludes probably ten times as many more, and the records of the Committee of Correspondence of Virginia, as transcribed in the Minute Book of that organization, do not contain a single letter or resolution that is not to be found in the Journals of the Burgesses as edited by me. I call your attention to this fact since they were purposely excluded for reasons above stated.

The original Journal of the Committee of Correspondence does not contain an entry

under date of May 30, 1774; hence the action taken by the twenty-five late representatives was not an action of the Committee of Correspondence. These twenty-five men met in the old Raleigh Tavern, and, as twenty-five was not a quorum, their action was simply in the form of a resolution, and their minutes were not deemed a part of the minutes of the Committee of Correspondence. The value of the paper, however, is important, and it might have been placed in the preface with good results.

I would further add that the original Journal of the Committee of Correspondence is in perfect order, and their transcripts are clearly legible. We have copied the entire work, and, so far as recognized by the Committee of Correspondence at the time, have published their complete records.

Yours very respectfully,

JOHN P. KENNEDY,
Librarian.

RICHMOND, VA., August 21, 1905.

Notes.

Mr. Albert Cook Myers, of Kennett Square, Pa., gives notice in the *Pennsylvania Magazine of History and Biography* for July that he is preparing a companion work to his 'Immigration of the Irish Quakers into Pennsylvania,' namely, one dealing similarly with the immigration of the English Quakers into Pennsylvania and New Jersey. Mr. Myers desires any documentary aid that may be offered in the shape of old diaries, journals, letters, and the like, with views of old Quaker houses in England of the seventeenth century.

Mr. J. F. Muirhead writes to us that he would be grateful for corrections or suggestions for the third edition of 'Baedeker's Handbook to Canada,' which he is now preparing. These may be sent him in care of Chas. Scribner's Sons, 153 Fifth Avenue, New York.

We read in *Polybiblion* for July that the catalogue of anonymous works on the history of France in the Bibliothèque Nationale now in progress, with volume one about to be put in use, will consist of three volumes. The first will alphabetize the personal names which occur in the titles of such works; the second will do the same by geographical names; and the third will include under various headings works not already comprehended. M. Levallois is in charge of the enterprise. *Polybiblion* also makes merry over the literature that has grown up regarding the authorship of the seventh stanza of the "Marseillaise," the veteran polemist being M. E.-J. Savigné, mayor of Sainte-Colombé-les-Vienne, who stands up for the Abbé Pessonneaux, as Anatole France for Louis du Bois. His latest brochure is entitled 'Un Couplet de la Marseillaise et l'Abbé Pessonneaux; Preuves Authentiques et Définitives.'

Shortly forthcoming from Macmillan Co. are 'Colonial Administration,' by Prof. Paul S. Reinsch; the fourth volume of Herbert Paul's 'History of England,' and the sixth and last of Austin Dobson's edition of the 'Diary and Letters of Mme. D'Arblay'; 'Andrew Marvell,' by Augustine Birrell; 'Abbotsford,' by the Rev. W. S. Crockett, 'The English Lakes,' by A. Heaton Cooper, and 'The Scenery of London,' by G. E. Mitton, all illustrated in color; and a Life of Wagner by John F. Runciman.

Messrs. Putnam promise 'Sex and Character,' by the late Otto Weininger; a translation of Julius Wolff's poem, 'The Wild Huntsman,' by Ralph Davidson; 'Mohammed and the Rise of Islam,' by the Rev. David Samuel Margoliouth, Laudian Professor of Arabic at Oxford; 'The Companionship of Books,' by the Rev. Frederick Rowland Marvin; and a work on Kate Greenaway by M. H. Spielmann.

'A Southern Girl in '61,' by Mrs. D. Giraud Wright, daughter of Senator Wigfall of Texas, and 'The Jewish Spectre,' by George H. Warner, are announced by Doubleday, Page & Co.

We have now three biographies of Lord Elgin. In the 'Letters and Journals of Lord Elgin,' by Theodore Walrond, the documents are connected by narrative, and the work is an excellent portrait of this eminent servant of the British Empire. The Life by the late Sir John George Bourinot, Clerk of the Canadian House of Commons, reviewed at the time of its publication in this journal, is one of a series of "Makers of Canada," and treats the subject specially from that point of view. The new Life ('The Earl of Elgin'), by Professor Wrong of Toronto University, is also one of a series, Methuen's "Colonial Library," and is a full narrative of the whole of Lord Elgin's career. Mr. Wrong has some new matter in the shape of privately printed letters, and his preface suggests that fresh light has been recently thrown on the importance of Lord Elgin as the builder of Colonial institutions and as the first British negotiator with Japan.

There lies on our table a copy of the Catalogue of the Woodside District Library, one of the system instituted by the municipality of Glasgow after the pattern of the branches of our New York Library, and likewise provided with buildings by the munificence of Mr. Carnegie. It is a neat, compact, and handsomely printed little volume, alphabetically arranged, with classification and analysis. A curious policy, against which gifts and acquisitions will constantly tell, is to furnish each branch library with different works on "specific subjects, as, for example, astronomy, or the French Revolution, or domestic economy"; thus forcing the reader to seek in the catalogues of the other branches (always on hand at each) what he wants besides what he finds. This does not seem to befit the age of card catalogues, even though provision is made for drawing upon any given branch library from any other. If Rousseau comes under the head of French Revolution, we remark that his 'Social Contract' is the only one of his works allotted to the Woodside District, and that in English. In other respects the catalogue exhibits the disproportions and omissions of brand-new libraries.

We have received the stately 'Quinquennial Catalogue of the Officers and Graduates of Harvard University, 1636-1905' and the companion Quinquennial Catalogue of the University's Law School, 1817-1904. Surely, of all lists of names, these belong in a class which may well challenge the highest veneration of mankind. They differ from catalogues of authors, for example, in possessing a thread —rather, a cable—of unity, spun by many generations of discipline to the genius of learning in one spot. To this spot, moreover, have been drawn, in Harvard's case, a large percentage from other States than Massachusetts or sections than New England, and no inconsiderable (in fact, a highly signficant) proportion from foreign parts. Take only the letter K, with its Kaan, Kagan, Kahn, Kahnweiler, Kallen, Kalopothakes, Kaneko, Kangisser, Kanthlener, Katigbak, Kattenhorn, Katzmann, Keleher, Keough, Keown, Kerans, Kimura, Kishimoto, Knudsen, Kofoid, Komura, Kozaki, Krokyn, Kurino—a mere skimming of surnames within the past thirty years that would have made the Puritan founders of the University stare and gasp, though in 1769 we encounter Kast and in 1768 Keous. Much curious reflection arises on studying the *novi homines* who still remain a single entry in the index. How does it happen, again, that a name so familiar as Bascom should show but two representatives (1768, 1802), and none for a century? Will the prime and solitary entry Boodro (1899) blossom out in time in such array as present Bradford or Coolidge? The Harvard Law School Catalogue lists 8,509 names. The oldest living graduate is Daniel Tarbox Jewett, class of 1833, still practising law in St. Louis in his ninety-ninth year.

The fifty-fourth annual issue of Otto Hübner's useful little 'Geographisch-statistische Tabellen' for all countries has just appeared (Frankfort: H. Keller; New York: Lemcke & Buechner). The editor, Dr. Juraschek, has been tempted to obliterate Korea and reëstablish Norway, in view of impending events, but has refrained. From the latest censuses he computes the population of Europe at a round 401,500,000; and of the whole earth at 1,525,000,000. European emigration, he observes, has now taken on the dimensions of a tribal or racial displacement; in 1903 it passed the million mark, from having been less than 440,000 in 1898. Especially striking are the tables at the end, showing the social composition of Russia's population, according to the census of 1897, with a hereditary nobility of 1,221,939, a bourgeoisie of 13,391,666, a peasantry of 96,943,857, and some 14,000,000 unclassified; the principal religious sects, with fewer Jews than Lutherans; and the chief nationalities by "governments"—truly a conglomeration, from Greeks to Kalmuks, Finns to Chinese, Tartars to Germans, Bulgarians to Ostiaks.

Secretary Taft's defence of the Philippine Administration against its critics, especially Mr. Alleyne Ireland, is the leading article of the *National Geographic Magazine* for August. But for the writer's position, it would be unworthy of further notice, so unqualified is he, from either ignorance or prejudice, to discuss questions involving the British colonial policy. In justification of the use of English in education, which is his principal topic, he says: "We have in the Philippines a much severer struggle to teach the Filipinos than they would have . . . in India, because we have a people who have no common language that is fit to be used by a civilized people," there being "twelve different dialects or languages in the Philippines." The statement is one which provokes a smile when one remembers that Lord Curzon governs fourteen distinct races speaking seventy-eight

different languages and dialects. There is the further implication that the reason why English is not taught in the elementary schools in India is that the British policy is to keep the Indian in subjection; and Secretary Taft states distinctly that he is "not aware as yet of any attempt on the part of England" to educate the people of tropical countries "up to the point where they may be capable of self-government." It is hard to treat such assertions seriously, in view of the Baboo product of English education in India, and the knowledge of the fact that the universal conviction of all well-informed Englishmen in India, from Lord Curzon down to the humblest missionary, is that the true development of the Indian mind and character can come only through his education, when a child, in his native language; for which reason, English in the elementary schools is prohibited. Our policy of having a large number of American officials is defended on the ground that this system gives the Filipinos an education in partial self-government. The English method of governing by a few responsible officials, the Secretary regards as simple despotism, utterly ignoring the fact that the English policy is to govern through the natives, maintaining native laws and customs so long as they do not conflict with natural rights, and thus affording the highest possible training in self-government, and one which is bearing fruit throughout India, but especially in the municipalities.

A sketch of the present condition of our knowledge of the ocean is given in the *Annales de Géographie* for July, with graphic pictures of the life revealed to us by the researches especially of the "Mæcenas of Oceanography," the Prince of Monaco, and, we may add, Prof. Alexander Agassiz. There are regions in which are colonies of Gorgonia grouped together and forming at great depths on the ocean floor veritable phosphorescent forests, oases of light in the midst of a desert of infinite shadow. There are fishes of strange forms which, like phantom ships, suddenly shoot colored rays athwart the ocean night. A practical side to these studies, as shown in the oceanographic conference held in Paris last winter, is the aid which they give to the fishing industries. The article on the forestry question in Spain has a special interest at the present time. The fact that there is no part of Europe so barren of forests as the Iberian peninsula is an evidence of Spanish decadence, for their value was known and appreciated centuries ago in Spain as perhaps in no other country. The great Alfonso X., *el Sabio*, in the thirteenth century, enacted laws for their preservation. In 1496 a decree was issued enjoining the communes to keep their woods in good condition, and prohibiting the felling of a single tree without the special authorization of the Prince. Now, several societies have been formed for the purpose of reforesting the land, and a Fiesta del Arbol is kept in many places in imitation of our Arbor Day, at which time the public-school children plant trees. In the region about Barcelona, which is the centre of the movement, 174,000 trees have been planted in the last five years.

A sympathetic sketch of the life of the late Desiderio Chilovi, librarian of the Central National Library in Florence, who died on June 7, or but a fortnight after his seventieth birthday had been honored on May 23, accompanies the latest issue of his *Bollettino* from the pen of S. Morpurgo. A pleasing portrait stands at the head, and Chilovi's bookplate, with its campanile, harking back to his birthplace in the Trentino, at the end. He had served the Library for forty years, and died before he could behold the new building which he had promoted with untiring energy. His writings were in his latter years—a 'Cronaca di un Idillio,' reminiscences of his childhood: 'Rosa Silnà,' an unpublished patriotic romance, laid in the Trentino and in Bohemia. He even contemplated a burlesque comedietta, and two children's books, one of which was to be a narration in epistolary form, but the letters to be facsimiled from the MS. to excite greater interest.

There are always new questions for the overtaxed managers of institutions to be bothered about. The Bates College corporation is to ask the Maine Legislature to repeal that provision of its charter which requires that the president and a majority of the Board of Fellows and of the Board of Overseers shall be members of some Baptist church. The apparent object of this movement is to enable the college to share in the pensions of the Carnegie foundation. But (aside from conscientious scruples to the effect that education ought to be preponderatingly Baptist any way) how is one to know that when a college ceases to be denominational, it may not cut off denominational subscriptions and donations, the result of devout self-sacrifice on the part of pious adherents, to such an extent as to counterbalance what the Carnegie Fund might be able to do for possible long-lived professors? Here is surely a knotty question.

The prevention of senility was the subject of a suggestive address by Sir James Crichton Browne before the Royal Institute of Public Health at its fourteenth annual congress. While not denying the fact that the most vigorous period of human life in its entirety was between twenty-five and forty years of age, he maintained that to say with Professor Osler that men above the latter age were comparatively useless, was to fly in the face of the biographical dictionary. After citing numerous instances in almost every department of human activity in refutation of this age-limit, he said that were a balance struck between the truly great and effectual achievements of men at from thirty to forty on the one hand and forty to fifty on the other, he should be inclined to think that, in proportion to the numbers living in those two decades respectively, the advantage would be with the latter, not only in magnitude but in profitableness to mankind. Long after fifty, and even sixty, contributions had been made of inestimable value to knowledge and the arts and sciences. In reference to the question how the processes of decay could be checked, he said that it was a good working hypothesis that the natural life of man was a century, and that every child should be brought up impressed with the obligation to live to one hundred, and should be taught faithful obedience to the laws of health by which the irregularities that tended to frustrate that laudable ambition would be avoided. By this means a century of life might be attained, and attained in health and vigor.

The sixth annual convention of the National German Association for School Hygiene, at its meeting in Stuttgart, spoke out plainly against the overburdening of pupils in the middle and higher classes of the public schools. The Prussian schedule, which is generally the model for all Germany, demands an average of school work of six and one-half hours for six days in the week—on some days as much as eight hours' school attendance being required. The Association declares this too much, for pedagogical reasons, making it impossible for pupils to do home work or to acquire independent thinking, and still more harmful from a hygienic point of view. It agreed to a resolution favoring confining all the real study work to the morning hours, and reserving the afternoon for such work as drawing, singing, and especially for physical exercises, such as calisthenics, swimming, and games, and for work at home. This can be done if the recitation periods are limited to forty-five minutes, so that thirty-six weekly periods can be distributed over the six days. The assertion was made that in a number of schools this plan had been tried and proved a success; and the Association accordingly appealed directly to the school authorities to cooperate with the medical and educational societies of the country to bring about a general reform in this direction.

—The biography which Mrs. Colquhoun Grant has just published under the title 'A Mother of Czars' (Dutton) finds its central figure in Marie Feodorovna, wife of Paul I., and mother of Alexander I. and Nicholas I. Unlike Catherine the Great at all other points, this princess resembled her stepmother in being a German of little dynastic importance. And as Sophia Augusta of Anhalt-Zerbst had been baptized into the Greek Church under the name of Catherine, so Sophia Dorothea of Würtemberg became by act of second baptism Marie Feodorovna. In studying the career of her heroine, Mrs. Grant does not pretend to have consulted Russian authorities, but takes virtually all her data from French sources. As a result, the contribution which she makes to historical knowledge is slight; and even as an adaptation of French memoirs her book is open to some criticism on technical grounds. This, however, is not to deny the usefulness of such a work in our present state of ignorance regarding nine-tenths of the Romanoffs and their wives. Mrs. Grant relies chiefly upon the life of the Baronne d'Oberkirch as edited by the Comte de Montbrisson, and devotes nearly half her space to an account of the trip which the Grand Duke Paul and his Duchess made throughout Western Europe in 1781. This portion of the narrative relates chiefly to the court of Louis XV., and depicts a kind of life which has been written of in a thousand memoirs. The action becomes somewhat more interesting on the return of Marie and her husband to Russia, but the details of their life during the latter part of Catherine's reign are hurried over, nor are we furnished with a very spirited account of Paul's assassination. Under the régime of her sons, the Dowager-Empress was treated with great respect, and exercised much more influence than she had had during the life of her husband. For personal virtue she offered a brilliant contrast to Catherine, but in saying this one

has spoken her chief praise. Mrs. Grant calls her "brave and steadfast," but she is not a woman to catch the attention among those great dames who put the best enthusiasm of their hearts into the struggle against Napoleon. Neither as a study of personality nor as an historical monograph can this volume be praised with much heartiness, but in our present dearth of books on Russian subjects it deserves to be known by those who feel a curiosity in the personal fortunes of the Romanoffs.

—'Catherine de' Medici and the French Reformation,' by Edith Sichel (Dutton), embraces fifteen chapters or separate essays on the period of the later Renaissance in France. While all three studies are made to centre round the figure of the Queen, a number of other well-known personages, like Diane de Poitiers, Jeanne de Navarre, Ronsard, and Bernard Palissy stand out prominently in the grouping of characters. With all of Miss Sichel's sweeping generalizations we are unable to agree, and some of them seem to us rather destitute of meaning, or at least to have the sound of logomachies. Take, for example, the following sentence: "Every movement has its person, its representative; and since men are entangled in actions, and actions disguise motives, it is in women, the clear mirrors of current feelings and tendencies, that integral types of an age will be found." This is a singular statement to make in a book which deals with a woman so immersed in action as was Catherine de Médicis; and, quite apart from such a contradiction in terms, the antithesis is not very illuminating. Nor are we assisted by the remainder of the same passage: "In Italy the prevailing corruption was so subtly interwoven with poetry, its women were surrounded by so rich a glamour, that real outlines are hard to distinguish; but in France, with its brilliant skepticism, its dry, scintillating atmosphere of matter-of-factness, types stand out as crisp and lucid as French aphorisms. In France, therefore, we shall not be slow to find figures that sum up whole periods; women who are, as it were, epigrams, expressive of profound experience." Catherine de Médicis has been called by a large variety of names, many of them uncomplimentary, but we doubt whether she has ever yet been called anything so unusual as an "epigram expressive of profound experience." We pause to illustrate a style of utterance which is not rare in this volume, and which detracts to some extent from the favorable impression one forms of the writer's more solid qualities. Miss Sichel has read widely in the memoirs of the later Valois period, and is familiar with the leading phases of the later Renaissance in other countries; but when she gives way to her love of ample language, one loses sight for the moment of her attainments and the appreciation of character which is shown in many passages. We also notice here and there signs of carelessness in the form of statement, as where it is said (p. 23) that the marriage of Henry with Margaret took place two days before the Massacre of St. Bartholomew. Having made the foregoing cavils, we are free to say something more pleasant in conclusion. Miss Sichel's essays are interesting, and the book as a whole marks a distinct advance on the author's 'Household of the Lafayettes.'

—Prof. P. Hume Brown is one of the few authors who can deny themselves the pleasure of writing a preface, and his 'Scotland in the Time of Queen Mary' (Methuen) is left to explain its chief motive as it advances. From a brief allusion in the text we infer that the six chapters of this book were originally six lectures delivered before the Society of Antiquaries, but the reference in question owes its chief importance to a statement which bears upon the title. Obviously, it would be a simple matter to weave John Knox, Maitland of Lethington, and many other celebrated persons into a work on Scotland in the days of Mary Stuart; but these leaders and the policies they stand for are put altogether aside to make room for the physical, social, and economic aspects of the country as it was during the second half of the sixteenth century. Even Mary herself is obliterated to gain space for a sketch of national life. "What," says Professor Brown, "were called in her own day the 'strange accidentis' of her public and personal career, were mere eddies in the irresistible stream which bore her people onward to fulfil 'the orb of their fate.'" When one begins to dissect a community as the people of Scotland are dissected and analyzed in the present volume, it is easy to become immersed in details and to lose sight of the town for the houses. But Professor Brown supports one proposition which gives a certain unity to all the multifarious pieces of information he has brought together concerning the state of the land, the appearance of villages and towns, the industrial conditions and the amusements of the masses. This is the statement that before the Reformation Scotland had no real nationality. "Previous to the great religious conflict there never was an issue before the Scottish people that went deep enough to elicit the conflicting instincts and tendencies which must be awakened before what we call a nation becomes possible." The War of Independence, though it had stimulated a national sentiment, is not permitted by Professor Brown to rank with the Reformation as a formative agency, because in the fourteenth century the Scottish people were still in a rudimentary stage of development. The range of topics here treated is extensive, but we shall single out only two subjects for special mention. Professor Brown's account of Scotland as it appeared to foreigners and his description of town life are both excellent pieces of workmanship in historical mosaic. Addressed in their first form to antiquaries, these six chapters should be in the hands of all who would know what manner of country Scotland was when it passed through the most acute spiritual crisis of its history.

—In almost every Italian town there is a group of painstaking, intelligent scholars who devote their lives to the study of its records and monuments, seeking no other reward than the consciousness of work well done. Their writings, frequently of the greatest value, are published, as a rule, in some local magazine, some "Bollettino" or "Miscellanea di Storia Patria," which, circulating almost exclusively among *eruditi* like themselves, is, as often as not, very difficult to procure after the lapse of a year or two. Under these circumstances, it will probably be useful to call attention to the work of Prof. G. Degli Azzi Vitelleschi on the relations of the Republic of Florence with the Guelph communes of Umbria during the fourteenth century ('Le Relazioni tra la Repubblica di Firenze e l'Umbria nel secolo xiv., secondo i documenti del R. Archivio di Stato di Firenze'). The first volume, which, as yet, alone is published (Perugia: Unione Tipografica Coöperativa), contains a "Regesto" of all the letters (*carteggi*) preserved among the Florentine archives which passed between the magistrates of Florence and those of Perugia, Orvieto, Città di Castello, Gubbio, and other Umbrian cities, from 1309 to 1400. The "Regesto" is preceded by a preface, which is a masterpiece of clearness and condensation, and is followed by an appendix containing a list of the Umbrian magistrates who, whether as Potestà, Captains of the People, or Executors of the Ordinances of Justice, bore rule in Florence during the fourteenth century. There is also a very complete index. The name and reputation of the author are a sufficient guarantee of the excellence and accuracy of a work which cannot fail to prove highly acceptable to students of the Trecento; the more so because the letters which it contains help us to make good many of those deplorable gaps which exist in the precious *Annali Decemvirali* of Perugia during the period in question.

GEOLOGY AND LANDSCAPE.

Landscape and History, and Other Essays. By Sir Archibald Geikie, F.R.S., D.C.L. The Macmillan Co. 1905.

There is always a measure of risk incident to the republication of magazine articles by a man of established reputation, for he is judged, and rightly judged, by the standard of his books, and he suffers if the collected articles fall below that standard. In the present instance, however, this procedure will certainly not injure, if it does not materially raise, the credit which Sir Archibald Geikie has won for himself as a clear and agreeable writer on scientific subjects, no less than as an independent investigator. The essays fall into three classes. One deals with landscape and its relations to historical events and to literature. A second class is purely technical, and handles several geological problems, such as the age of our planet and the rival theories which used to be associated with the names of Hutton and Werner, and used to be popularly called the Plutonian and Neptunian hypotheses. The third includes two biographical sketches, of Charles Darwin and of Hugh Miller respectively. There is also one essay, not strictly referable to any of the foregoing divisions, which examines a question of great present actuality—the position of scientific study in education, and the extent to which it can be made to furnish a training in the higher mental faculties and aptitudes. Thus something is provided for every kind of reader—for the man of science, for the student of history, and for the intelligent amateur. On the whole, however, the essays are popular, rather than technical; and there is very little in them beyond the reach of the average educated man, who nowadays knows more about the more obvious and surface-lying facts of national science than he did even twenty years ago, increasingly difficult as the underlying principles have become.

The first essay, entitled "Landscape in History," though it gives its name to the volume, and has some suggestive remarks upon the changes in the surface of countries which have to be regarded by the historian as conditioning the events he describes, is to us less interesting, because touching a more familiar theme, than the third, called "Landscape and Literature." This essay deals with the influence which the external aspects of nature have exerted upon poets who have in modern times shown themselves sensitive to impressions of natural beauty. Among these poets, one of the earliest was James Thomson, author of the once famous 'Seasons,' a work which, it is to be feared, is now but little read either in America or in England. Thomson was a Scotchman, born in A. D. 1700, in Roxburghshire, "within hearing of the ripple of the Tweed, within sight of the Cheviot and Lammermair Hills, and in a region famous in Border ballad and song." Mr. Stopford Brooke, in his admirable 'Primer of English Literature,' perhaps the most original and illuminative effort to deal with a vast literary subject in very small compass that our generation has seen, makes the remark that the love of nature and the feeling for natural beauty have been far stronger in the Scotch poets than in those of South Britain, and suggests that the larger strain of Celtic blood may have something to do with this, as it is certainly true that there is more feeling for nature in primitive Celtic literature than in the primitive literature of the Teutonic peoples. Thomson is a case in point. He was a younger contemporary of Addison, Prior and Pope, but how different! His 'Winter,' published in 1725, is full of Scottish Lowland landscape, and brings into English poetry an appreciation of natural beauty which does not take root there until we find it first in Gray, who belongs to the next generation, and then, much more developed, in the still younger Cowper.

Sir A. Geikie has some excellent observations on the kinds of landscape which Thomson and Cowper described. He shows how Thomson's earlier descriptions are entirely of Scottish scenery, and how, when the poet had come to know England, he began to appreciate its softer landscapes, and to paint them with equal exactness and felicity. Cowper's life, during its productive period, was largely spent in the valley (or rather plain) traversed by the English Ouse, the Ouse of Northamptonshire and Huntingdonshire—a region comparatively featureless, with wide stretches of level or slightly undulating land, and broad, slow-moving streams.

"The scenery of the Ouse Valley," says our author (p. 84), "is thoroughly characteristic of the southern lowlands. The ground lies on limestones and clays, belonging to the oolitic series, which, though they have been greatly denuded, have yielded in a generally equable manner to the progress of decay. They possess no such differences of structure as to allow one part of them to project in crag or scar above the rest. They have been worn down into a gently undulating plateau or plain, covered with cornfields and pastures, and dotted with occasional woods and 'spinnies' or patches of trees. Farms and villages diversify the landscape, while to the north lies the forest-like expanse of Yardley Chase. Through this champaign the River Ouse has cut for itself a winding valley, the bottom of which, quite flat, and from a few hundred yards to upwards of a mile in breadth, lies rather more than a hundred feet below the general level of the country. Along the flat alluvial plain, the stream, flowing sluggishly among rushes and sedges, curves in circuitous bends, often dividing so as to enclose insular patches of meadow, which it entirely overspreads in times of flood. The slopes rise softly from the river plain, now projecting, now retreating, as the valley winds from side to side. A gentle ascent brings us from the banks of the Ouse up to the highest part of the ground in the vicinity, and places before our eyes a wide sweep of rich agricultural country, with peeps of village spires and gleams of the winding river."

This picture of the landscape that lay before Cowper, which we have quoted as a sample of Sir A. Geikie's descriptive style, is followed by passages extracted from Cowper's 'Task,' passages too long to be repeated here, which show how well he discerned and reproduced what met his eyes. The same method is applied with no less care and skill to the poetry of Robert Burns, who lived even closer to nature, and was more intimately touched by her moods, as one may see by his half-complaints that she did not respond to his own moods. The opening lines of his famous and, in its way, unsurpassed "Banks and Braes o' Bonnie Doon" are an example. Sir Archibald well notes that

"the landscapes of Burns are marked by some curious limitations. Though he was born within sight of the picturesque mountain group of Arran, it does not come within his poetic outlook. [This was remarked by Wordsworth.] Though the craggy ocean pyramid of the Clyde rose so stupendously from the firth in front of him, he makes no use of it further than to tell how 'Meg was deaf as Ailsa Craig.' Indeed, if we examine his treatment of scenery, we may observe that it is the nearer detail that appeals to him. His pictures are exquisite foregrounds, with seldom any distinct distance."

"Deaf as Ailsa Craig" was probably a proverbial phrase among the Ayrshire folk who saw this great, grim rock rise before them out of the weltering waves. Perhaps the reason why the splendid peaks of Arran twenty or thirty miles away did not touch Burns, was because his sense of scenery is so intensely subjective. For him, it must be associated with human emotion. One must be in the midst of it to feel it. The granite pinnacles of Arran had nothing to do with the life of the poet or his companions. When one comes to a reflective and philosophical poet, such as was Coleridge or Wordsworth, the case becomes different, and the distant landscape tells upon the spirit quite as much as do the sights and sounds hard by. With Wordsworth and the scenery of the Lake Country, Sir Archibald deals briefly, but well; and then passes on to a less familiar but interesting theme in his remarks upon the landscape of the Western Highlands of Scotland in its relations to the so-called Ossianic poems. Hard as it may be to discriminate between the really ancient element in those poems and that which was introduced by James Macpherson, himself a Highlander, there is doubtless not only a fidelity to nature in them, but even a certain measure of the old Celtic sentiment about nature, as we have it in undoubted fragments of old Celtic writers like St. Columba.

The fourth essay, "On the Origin of the Scenery of the British Islands," is more distinctly scientific in subject and treatment than the first three. Taking the mountains, the table-lands, the valleys and the plains of Great Britain, our author examines the geological causes which have made these what they are, and incidentally deals also with the divide which runs through the island from south to north, with the lakes, and with the coast line. He dwells chiefly upon the forces and influences which have laid out and moulded the present surface, but touches also on the character of the scenery as the result of those forces. It need hardly be said that he is a leading apostle of the modern school which attributes nearly all of the features of the surface of country, as we see it now, to denudation; that is, to the action of water and of weather generally upon the solid earth. It follows from this that the orographic character of a region, the heights of its hills and the arrangement of its valleys, is often not what we should expect from its geological structure. Sir A. Geikie illustrates this from the case of the Lake District in the North of England, and similarly remarks, as regards the Scottish Highlands:

"The present ridges and valleys of the Highlands are entirely the work of erosion. When they began to be traced, the area probably presented the appearance of a wide, undulating table-land. Since that early time the valleys have sunk deeper and deeper into the framework of the land, the ridges have grown narrower, and the mountains have arisen, not by upheaval from below, but by the carving away of the rest of the block of which they formed a part. In this evolution, geological structure has played an important part in guiding the erosive tools. The composition of the rock-masses has likewise been effective in determining the individuality of the mountain forms."

It must of course be remembered, as the last two sentences of this extract convey, that the character of a rock has a great deal to do with the final aspect of the surface—that is to say, with the aspect of the landscape. The hard rocks yield to the weather much more slowly than do the softer ones. They are usually more unequal in the degree of hardness which particular parts show, so that, when they wear down under climatic influences, some parts resist longer than others, and remain as bold, possibly precipitous, heights. Moreover, their crystalline structure gives to different sorts of rock a different fracture, and causes the forms which are so characteristic of such rocks as gneiss, granite, trap, porphyry, carboniferous or Jurassic limestone. Rock study is an essential element in the comprehension of scenery, though comparatively few landscape painters have troubled themselves with it. J. M. W. Turner did; and from his pictures you can generally discover what is the rock of the country which he is painting, if it be a hilly country.

The ordinary observer finds it hard to believe that the action of weather and of streams can have caused those striking inequalities of surface which one sees in such regions as the Highlands of Scotland, or the Alps, or the Rocky Mountains and Sierra Nevada. The time required is almost unthinkably vast. To this question of geological time, there is devoted an interesting essay, the sixth, composed as an address delivered to the geological section of the British Association at its meeting of 1899. A controversy arose upon the subject more than thirty years ago, initiated by William Thomson (now Lord Kelvin) when he argued from physicial and astronomical data that the age of our planet could not be nearly so great as most recent

geologists had believed. Hutton, one of the most illustrious among the founders of the science, could find no trace of a beginning, no rocks which could be even plausibly regarded as being the earliest formed. And since Hutton's time both geologists and the disciples of Charles Darwin, who need enormous periods of time for the formation of species upon the Darwinian lines, have continued to assume enormous periods of time for the bringing of the earth into its present condition; periods far exceeding thousands of millions of years. Lord Kelvin, however, who in 1868 was disposed to fix four hundred millions of years as a maximum, has now reduced his estimate to a lower figure, "something more than twenty and less than forty millions of years." Sir A. Geikie, in this essay, and in the fifth (address delivered as president of the British Association in 1892), sets out the ground on which geologists are justified in controverting Lord Kelvin's view. He holds that there is "no evidence to show that geological processes are now slower and feebler than they used to be," and that "nothing has yet been detected throughout the whole vast succession of sedimentary strata which necessarily demands that more violent and rapid action which physicists suppose to have been the order of nature during the past." The question is far too large and too difficult to be discussed in this place; but the considerations our author puts forward well deserve to be weighed. In his own demands for time, he is comparatively moderate, holding that "one hundred millions of years could suffice for that portion of the history which is registered in the stratified rocks of the earth's crust." He suggests that observations far more numerous and more exact than any yet made are needed before we can even approximately determine the rate at which sedimentation is proceeding in the sea and in lakes, and the rate at which subaerial denudation goes on in wearing down the surface of rocks and reducing the level of the surface generally.

Much interesting matter is to be found in the other essays, to which we have here no space to refer more particularly. None better deserves the attention of the intelligent traveller or historian than the last, which treats of the Roman Campagna; a region which the geologist loves because it presents so many curious phenomena of volcanic action and of the deposition of sedimentary rocks, and which has a still more exceptional interest for the student of history because few parts of the earth's surface have witnessed a longer series of remarkable events. Sir A. Geikie describes very clearly the forces by which the hills, and the undulating plain, and the course of the Tiber became what they now are, and suggests that the volcanic forces of which such abundant traces remain, may have been more active in the early days of the Roman city than we have been generally led to believe. The essay is one to which there might well be allotted a place in a good guide-book to Rome, for the traveller would find it most helpful in studying the scenery which he surveys from the top of Janiculum, or from the more commanding height of the Alban Mount.

THE AUTHOR OF 'JOHN INGLESANT.'

Life, Letters, and Literary Remains of J. H. Shorthouse. Edited by his Wife. Two vols. Macmillan. 1905.

The volume of biography and correspondence which constitutes in every sense the better half of the publication before us amply confirms the impression already derived from Shorthouse's principal work, that his power resided rather in his moral nature than in his intellect. There is little in his letters or the records of his conversation that can be considered profound, striking, or even suggestive; and yet we do not tire of a succession of insignificances from whose confluence the vision of a character delicate without weakness, refined without effeminacy, and spiritual without pretension gradually evolves itself. We have to do with a Quaker Anglican, a man in whom the mysticism inbred in the genuine Quaker took the form of a veneration for sacramental symbolism, which made him a worshipper with the Church of England. Much about the same time another Friend, of character equally high and more masculine understanding, John Bellows, was recording his extreme thankfulness that the study of Barclay's 'Apology' had knitted him to Quakerism for ever. A comparative study of the two men would form an interesting chapter in religious psychology.

Shorthouse had certainly something to show for his conversion, for without it he would hardly have produced 'John Inglesant,' his one but sufficient title to celebrity. It may indeed be affirmed that a man capable of writing such a book could not but become an Anglican of the best type, no matter what his original creed. It is no uncommon experience (and, with the growth of culture and the study of the past, it will become more and more frequent) to encounter survivals from an antique period into a later one. Keats and Landor were such bequests from Greece and Rome, and Shorthouse displays a similar reversion to the seventeenth century. It is this, even more than the literary merit of 'John Inglesant,' that gives him an abiding place in literature. He fills a place occupied by no one else; he is the visible type of that remarkable reaction towards the monarchical and ecclesiastical ideals of the seventeenth century which has distinctly colored, though without largely modifying, English opinion in the nineteenth. In so far as it has denoted worship of the House of Stuart, this can only be stigmatized as idle and mischievous superstition; but reverence for the Cavalier ideal of loyalty, chivalry, and courtesy, and "the beauty of holiness," is a more respectable sentiment, and has enriched England's national life with elements it could ill have spared. In the first half of the nineteenth century it was deformed by much bigotry and unfairness; but the Puritan ideal also gradually worked its way, and Shorthouse, Anglican by taste and religious conviction, Latitudinarian by an innate spirit of equity, Nonconformist by ancestry, came just at the right time and in the right place to depict the age with justice to all its conflicting tendencies. This was his own conscious aim. He says in a letter to Mr. Gosse, April 1, 1883:

"When many years ago I began the book ['John Inglesant'], my principal, perhaps sole object was to endeavor for my own pleasure to realize, if possible, something of that exquisite age-spirit which combined all the finest feelings of our nature, and all the sympathies of our existence, with a certain picturesqueness of tone and result which seems to me to mark the seventeenth century."

It is the perfect accomplishment of this admirable design which gives Shorthouse an enduring place in literature. 'John Inglesant' might have been even a better novel than it is, and yet have failed to secure the author the permanent position which he holds as the representative of the movement of the English mind in the nineteenth century towards the seventeenth century of the pre-Restoration period. The thing is done now, and need not be repeated. It is the especial service of this memoir and letters to show how entirely Shorthouse belonged in spirit to the period of his predilection. Though a manufacturer of chemicals, and, as would appear, by no means inattentive to business, he appears just the kind of man whom we can imagine consorting with Wotton or Walton. It is not the political or military aspects of the age that chiefly interest him; like his own hero, had he taken part in the civil war, he would soon have become "sick and weary of the sight of fighting, and especially of plundering." His sympathy is with its spiritual conflicts, particularly the great problem which so beset the Anglican divines of that period, whether a reconciliation with Rome was possible or not. From one point of view 'John Inglesant' may be regarded as a solemn trial of this question, resulting in a negative verdict. This explains and justifies the transfer of scene to Italy, for only there could the case be fairly tried out. Nothing is more remarkable than the author's perfect fairness, so unlike that of the ordinary polemical novelist. The book has been not unreasonably described as a satire upon the Jesuits, but neither the Jesuits' persons nor their principles are ever represented in a ridiculous light. The same candor is evinced in the treatment of personages with whom the author has less sympathy, such as Hobbes and the paganizing Cardinal. Both are allowed to speak for themselves exactly as they would have spoken in real life.

The close association of 'John Inglesant' with the seventeenth century helps the book in another way, by justifying the romantic atmosphere which envelops it. No work of fiction is better entitled to the character of a romance. Every incident and every personage is more or less romantic—stands aside, that is, from the current of ordinary existence with a distinct deflection to the side of beauty and picturesqueness. In an age like ours, such a tendency might appear fanciful or artificial; but the first half of the seventeenth century actually was a romantic age, and receives more justice by being treated as such. Every minor detail is perfect: the main fault of the book is a fundamental flaw, inherent in the conception itself. It is inconceivable that the Jesuits, being such as they are described, and having such a pupil as Inglesant is described, should have failed to hold him. They could easily have subjected him to a discipline which would have made him entirely theirs, and unquestionably would have done so. It is true that if the story had taken this

course it would not have represented the author's mind, and would not have been worth writing; we must feel, nevertheless, that its charm has been gained at the expense of truth to nature. There are too numerous indications of the subject having been read up, without living contact with it at first hand. In the astrological scene, for instance, Mercury is said to be going a square of the sun; but a square is an aspect of 90 degrees, and Mercury can never be further from the sun than 28. In the description of the conclave, a key is said to be given to the Bishop of Rome, as if there could be a Bishop of Rome during a Papal interregnum; nor was the late Pope Innocent the Tenth a kinsman of the Barberini. The mission to the Duke of Umbria, and the magnificent reward conferred upon Inglesant for doing nothing, delightfully as they are told, almost border upon the absurd; yet they are based upon a real transaction, the acquisition by the Papacy of the dominions of the last Duke of Urbino. But agents very different from Inglesant were employed in that business.

'John Inglesant' has been frequently compared with 'Marius the Epicurean,' and the parallel is not unreasonable. The relation between the books may be described as charm of story versus charm of style, and we must think that story carries it. Pater is a stronger and deeper thinker than Shorthouse, and a greater artist in words, but he lacks the especial qualities of the novelist. His story flags for lack of incident, while every page of 'Inglesant' tempts the reader on to the next. 'Marius' is in some measure a palinodia. Shorthouse, so far as can be judged by these letters, seems never to have retracted anything after he had worked his way to what he describes in 1880 as "a perfect toleration of and indifference to all creeds and opinions as alike the outcome of a central light." Beyond this one can hardly progress, and there seems much excuse for the unknown person who too dogmatically assured a friend of Shorthouse's that "the author of 'John Inglesant' would never write another book." It would have been better for his fame if he had not, as his later writings, though not devoid of interest, failed to impress the world, and left him as conspicuously as ever "the man of one book." This character will not be modified by the pleasing though in no way brilliant letters now published, or by the essays and tales which occupy the second volume, none of which can be called striking or original, though few are without some charming passages of description or feeling.

Russia. By Sir Donald Mackenzie Wallace, K.C.L.E., K.C.V.O. Entirely new and much enlarged edition, revised, and in great part rewritten. With portrait of the Author and two colored maps. Henry Holt & Co. 1905.

Sir Donald Wallace's famous book is too well known and too highly prized to make it necessary for us to review at length this new edition. It remains only for us to inform our readers of the author's reason for issuing it, his aims, and the precise manner in which he has carried them out, in order that they may realize how a book of extreme value on a remarkably difficult subject has been rendered invaluable—nay, indispensable—for those who wish clearly to understand present conditions and future possibilities in the realm of the Tsar. In his latest Preface, the author tells us that it was originally his intention to write an entirely new work, embodying his more recent researches and observations; but, finding that constant reference to past events would be necessary, and that an enormous proportion of his former book must be included in the new one, he decided to recast and complete his old material. No decision could have been wiser; and it is in line with Sir Donald's usual good judgment, which, together with his keen comprehension of the really important factors and of what the public wished to know, formed the most salient characteristic of his original work.

The early chapters remain practically unaltered, occasional footnotes bringing the general subjects treated up to date. In the chapter on "The Village Priest" more is necessary. On page 61 (after omitting, on the previous page, an explanation of how the ikons gradually came, in many cases, to be almost entirely covered with metal plaques, representing clothing), the author adds an important exposition concerning the attitude of the Eastern Orthodox Church toward science, recasts the following paragraph, and amplifies the chapter with two pages of new matter, dealing with the present statistics of the clergy and the new type of parish priest now in process of evolution. The chapter on "Imperial Administration and Officials" illustrates in addition the process just described, and the same course has been adopted for several later sections; two pages have been transferred, bodily, from the former chapter on "Local Self-Government" to pages 342-4, greater clearness and consecutiveness of treatment being thereby secured. Rather an amusing omission follows the statement (p. 331) that the Russian Empire, "even at the present day, is far from being a compact, homogeneous State." In the original, the text proceeded thus: "In many respects, it resembles our Indian Empire more closely than a European country, and we all know what India would become if the strong, cohesive power of the Administration were withdrawn." But on page 337 the author counterbalances this by citing an instance of the "Circumlocution Office" in India, which precisely corresponds to the Russian method held up to criticism.

To the chapter on "Moscow and the Slavophils" Sir Donald adds a description of the coronation of the reigning Emperor, in 1896; and his recital of the effect produced upon him by the church music is worth quoting for its poetry and its accurate expressiveness:

> "Listening with intense emotion," he says, "I involuntarily recall to mind Fra Angelico's pictures of angelic choirs, and cannot help thinking that the pious old Florentine, whose soul was attuned to all that was sacred and beautiful, must have heard in imagination such music as this. So strong is the impression that the subsequent details of the long ceremony, including the anointment with the holy chrism, fail to engrave themselves on my memory."

Added paragraphs at the end of the chapter deal with present-day Slavophils. In addition to some rewriting, the chapter on "Landed Proprietors since Emancipation" has received extensive additions, whose importance will speedily be recognized when the reader reflects how much experience has been accumulated by those proprietors since the date of the original edition. The valuable augmentations of the following chapter on "The Emancipated Peasantry" are more than twice as voluminous as those just mentioned. The former chapter (which occurred early in the book) on "The New Local Self-Government" is replaced, at this later point, by one entitled "The Zemstvo and the Local Self-Government," containing a great mass of new matter so arranged that the logical sequence is much clearer. "The New Law Courts" has been brought down to date and recast extensively. Entirely new chapters have been added on "Revolutionary Nihilism and the Reaction," "Socialist Propaganda, Revolutionary Agitation, and Terrorism," "Industrial Progress and the Proletariat," "The Revolutionary Movement in its Latest Phase," and "The Present Situation." Sir Donald's well-known clarity of comprehension, arrangement, and statement have not failed him in treating these complicated topics; and his conspicuous fairness, as well as his reasonableness, wins the admiration of the reader, who feels that at last he has threaded his way intelligently through the dark labyrinth of Russian affairs. The chapter which originally concluded the book, on "Expansion and the Eastern Question," has been judiciously rewritten, brought down to last May under the title of "Territorial Expansion and Foreign Policy," and moved forward one place.

Sir Donald's final remark is that he is conscious he is offering a very lame and impotent conclusion, for which he pleads extenuating circumstances; and he declines to make any predictions, declaring that what the situation may be by the time his book is published he does not profess to see. Nevertheless, all that it is possible for any man to contribute to an understanding of that situation at any time in the future, he has succeeded, in the highest measure, in supplying by the firm foundation of this admirable volume.

Schubert. By Edmondstoune Duncan. E. P. Dutton. 1905.

While Franz Schubert had almost as great an influence on the course of music as Richard Wagner, the literature relating to the two is absurdly disproportionate in quantity. This is largely due to the scant relics of the great song-writer; there are extant only thirty-two of his letters as against more than half-a-dozen volumes by Wagner. Apart from Schober and Spaun, hardly any of Schubert's friends suspected what a great man he was. His diary was sold piecemeal by a mercenary dealer, and only a few leaves have been recovered. Under such circumstances the writing of a life of Schubert is a considerable literary feat, and an author cannot be blamed if he has little or nothing new to tell. Yet Mr. Duncan has succeeded in preparing an interesting and useful volume of 280 pages on this composer; the best, on the whole, in the English language, apart from Grove's long article in his 'Dictionary of Music and Musicians,' which, however, has never been issued separately, as he intended it should be.

The chief fault of Mr. Duncan's book is a curious habit of repeating biographic

details or criticisms in different sections of it. For instance, Schubert's alleged infatuation with the Countess Esterhazy is discussed on pages 22, 48, and 98, yet the prosaic truth, as told in Friedländer's 'Beiträge zur Biographie Schubert's' and elsewhere is not revealed. Mandyczewski, the editor of the complete edition of Schubert's works, also fails to get the consideration due him. Nor are the best two German books on Schubert (Heuberger's, and Riggli's, Reclam edition) mentioned in the Bibliography, though it takes up ten pages and is in some respects excellent. It also fails to mention important contributions to the Schubert literature printed in America; Dvorák's essay in the *Century Magazine*, for example, which Sir George Grove pronounced the best article on that composer ever written. Were it not for the author's name, one might suspect him of being a German professor: some of his best and most important things are printed in footnote type in the Bibliography, where they do not belong. Under Kreissle von Hellborn he digresses to Grove and then subdigresses, to the extent of a page, on the subject of Schubert's counterpoint. What he says is admirable. Whereas even Grove had declared Schubert to be deficient in counterpoint, Mr. Duncan says quite truly (here he would have found Dvorák agreeing with him) that he "was one of the greatest contrapuntists who ever lived. He could *inspire* his counterpoint, as old Sebastian Bach knew so well how to do." He was admittedly one of the greatest quartet writers, and "no quartet writer, to be successful, can be deficient in counterpoint."

Mr. Duncan is at his best in discussing the poetic side of Schubert's songs; he has something new to say regarding the important and much neglected subject of translations, calling the attention of publishers, among other things, to Coleridge's wonderful version of "Des Mädchens Klage," which, to be sure, comprises only the first two stanzas. There are eight portraits and facsimiles in this volume, but the best thing in it is what the author says on the "Unfinished" Symphony. It may be questioned, he says, whether the impression conveyed by this title (which, of course, was not Schubert's) "is realized to any extent by the hearer of this symphony. The unity of the four-movement type of symphony (or sonata) is probably an illusion of habit, which works like Beethoven's Sonata in E minor (Op. 90) or that in F sharp (Op. 78)—another two-movement sonata—were intended to illustrate."

Wild Wings: Adventures of a Camera-Hunter among the Larger Wild Birds of North America on Sea and Land. By Herbert Keightley Job. With an introductory letter by Theodore Roosevelt. With 160 illustrations after photographs from life by the Author. Boston: Houghton, Mifflin & Co. 8vo, pp. xxviii., 341. 1905.

Birds by Land and Sea. By John Maclair Boraston. John Lane. 8vo, pp. xvi., 282. 1905.

For years the Rev. H. K. Job of Kent, Conn., has devoted his annual vacations to hunting with a camera. In his quest for the larger game, he has travelled over almost all the Atlantic Coast, from the Florida Keys to Labrador, as well as inland, visiting many unfrequented and out-of-the-way places. On these expeditions he has met with numerous interesting episodes, and appears to have enjoyed exceptional opportunities to study the life habits and to secure photographs of the domestic affairs of many rare and little-known birds. In his 'Wild Wings' he gives an account of the birds he has met, and pictures the luck he has experienced as a camera-hunter. Of the sport itself, he says:

"Of all the various outdoor recreations which I have tried, when it comes to genuine, exciting sport give me hunting with the camera. In past years I have tried shooting and collecting, but this new hunting entirely outclasses them. It requires more skill than shooting, and hence is a finer sport. The results are of more interest and value, and, withal, the lives of the wild creatures are spared for our further pleasure."

The book is divided into five parts, each of which consists of a number of chapters or sketches. Most of these have appeared before as magazine articles, but have been somewhat expanded and more fully illustrated in the reissue. Part I., "Adventuring in Florida," embraces the following five chapters: Cities of the Brown Pelican; Following Audubon among the Florida Keys; In the Cape Sable Wilderness; The Great Cuthbert Rookery; On Lonely Bird Key. These give one an idea of the wealth of the sub-tropical avifauna, and are illustrated by a fine harvest of photographs, showing home-life views of such birds as the Roseate Spoonbill, American and Snowy Egret, Ward's Little Blue and Louisiana Heron, White and Wood Ibis, Florida Cormorant, Man-o'-War Bird, the Noddy and Sooty Tern, etc., etc. Part II., "Other Wanderings South," consists of three chapters, treating of the Black and Turkey Vultures, the bird inhabitants of Smith's and Cobb's Islands and of the adjacent and intermediate Virginia marshes and sandspits, and the living Egret, with an account of the revolting manner in which this bird has been almost exterminated to supply the millinery trade with "aigrettes." Part III. has to do with the sea-birds inhabiting Bird Rock in the Gulf of St. Lawrence and Seal Island off the southern coast of Nova Scotia; and records some sea trips off Cape Cod, Mass. In Part IV. divers experiences with a host of snipe and plovers in various localities, chiefly during migration time, are related; the nesting affairs of the Least Sandpipers, Wilson's Snipe, and Ring-necked Plover displayed, and the breeding of the Oyster-catcher, the Willet, and Wilson's Plover described. The East American birds of prey take possession of Part V., which involves the search for hawk's nests and adventures with owls.

Mr. Job supplies a most interesting series of illustrations, direct from life, showing the nesting habits, flight, and characteristic poses of many of our larger wild birds. His book should appeal to a large circle of readers, especially the ornithologist, the sportsman, and the nature-lover, as well as the omnipresent camera fiend.

Mr. Boraston records for us a year's study of birds "with field-glass and camera." His observations were made on "early morning, evening, and week-end rambles," in the vicinity of Stretford, near Manchester, England.. A chapter is devoted to each month, under which the doings of the characteristic birds of the season are discussed. Beginning with September, the month of avian unrest, we are told by Mr. Boraston how the birds of his region, especially the swallows, prepare for their journey south; incidentally he calls attention to the various ideas entertained in the past regarding the autumnal disappearance of birds and bird migration. Month by month the arrivals, departures, and changes in the local fauna and their environment are considered. Mr. Boraston shows the gradual replacement of the summer birds by arrivals from the north during October, November, and December, and depicts graphically the struggle for existence of these winter sojourners. January starts the returning tide, which ends with busy May and June, the housekeeping days among the birds and the busiest time for the author's camera. The month of June was spent on the island of Anglesey and on Puffin Island, on each of which the author has bestowed a chapter. Here rock-bound shores furnish many of the sea-birds a nesting site, and the text and illustrations give one a graphic conception of the region and its winged inhabitants, as well as of the trials, tribulations, and pleasures which may be experienced by the bird student and bird photographer.

The seventy-two half-tone illustrations which are scattered through the volume speak well for the author's patience and skill with the camera. They represent adult, young, or homelike views of forty-two of the ninety species considered. Those portraying the Ringed Plover, Blue Tit, Song-Thrush, and Garden-Warbler are superb. The book is printed on a good quality of paper, bound in cloth, with a pleasing cover design in gold, representing a flight of swallows.

Ivories. By Alfred Maskell, F. S. A. (The Connoisseur's Library). London: Methuen & Co.; New York: G. P. Putnam's Sons. 1905. Pp. xiii., 443.

This large volume is printed on excellent laid paper of old-fashioned look, light and fine, so that the book is not heavy in the hand, although there are 88 inserted plates. The photographic reproductions are not of the usual half-tone sort; they are apparently produced by the gelatine process in some of its forms, and for this purpose the thickly coated paper has not been required. The pictures are printed in very light or pale color, probably with deliberate purpose, to give the appearance of ivory or bone; but they are sufficiently clear, and, in most cases, the relief is marked in an adequate fashion. There is, of course, a failure in minute details. A different process would be required to give perfectly the most delicate parts of a Chinese pierced pattern or a Byzantine relief. There are hundreds of objects shown in the plates, and a number of them are certainly intelligible enough to him who will look with understanding eyes.

The preface states that the author has made his references, "as far as possible, to objects which are easily accessible and may be seen in our great national collections—the South Kensington Museum, the British Museum, the Mayer Collection at Liverpool, and the Wallace Collection." In this, too, the author doubtless consulted his own convenience (for it would

be an endless trouble to go about Europe making photographs), as well as that of the few students of his book who will follow up his examples and verify his statements in the museums of Great Britain. Neither is there any complaint to be made; for, indeed, every needed quality and peculiarity of minute sculpture, in ivory, in bone, in hardwood, and the like, is set forth in these plates. The ivory-covered chair at Ravenna is given, and also the throne of Ivan III. in the Kremlin, and the "Chair of St. Peter" at Rome; so that in these cases at least a photograph was brought from foreign parts. The painted statuette of the Virgin (*Vierge ouvrante*), of the Louvre, and the similar statuette called the Boubon Virgin, now in private hands, are given, so that this peculiar form of mediæval religious *mobilier* is sufficiently shown. If the magnificent statuette of Villeneuve-lez-Avignon is not given, a not dissimilar group, "Madonna and Child," in the British Museum, is selected; and it may be thought that the special beauty of the French piece is in its wonderful painting and gilding, which is only a secondary quality in dealing with carved ivories. An enthusiast would certainly be gratified by a larger selection from such an extraordinary display as was made in Paris in 1900. Consular diptychs, early mediæval book covers, fourteenth-century tables and shrines and tabernacles—it is hard to draw the line and decide by which name to call these pieces—heads of croziers and archbishops' staves, tankards and the doors of cabinets of the seventeenth century; and from the Far East a few of the Japanese netsukes and a Chinese hollow ball,

"Laborious Orient ivory sphere in sphere"—

all these are to be found in this collection.

The enthusiastic student will be more vexed by the scarcity of the quite modern ivories of Dieppe, perhaps, than by any other shortcoming. Mr. Maskell seems to be aware that English collections are without sufficient representation of post-Renaissance ivories, for he says as much in connection with the Dieppe work; but, indeed, it is a constant annoyance in these English handbooks that the local Continental schools are so generally disregarded. And then, of course, in order to make a really adequate encyclopædia of ivory-carving, of minute sculptures of any kind, one would have to devote much time to travel from town to town throughout France, and perhaps with not less inducement to the more important towns of Germany; while as for Spain, we all know by rumor and by inference how rich the convents and the churches must be. In fact, the museums alone do not show all that there is, and the priest of many a small parish church must be persuaded to unlock the sacristy and open his armoires and his cope chests before the student will have satisfied himself and will feel sure that there are not many realms left to conquer. The clergyman brought from his home or kept from his *déjeuner* in this fashion is always gracious if you contribute something handsome to his poor-box—if your hopes have been realized.

The text being not very systematic, and the index inadequate, this book will never be very convenient for reference. It is one to read rather than to refer to; and, unfortunately, it is a little too long-winded to be read with comfort. There are remarks, too, which are curiously uncalled for, and some suggest a not very practised eye, or eye and mind. The author seems a little too much surprised by some of the things he has discovered and described, and a little too indifferent to others. While our praise, therefore, cannot be very hearty, this still remains the largest book of the sort, with the most complete display of pictures.

The Macmillan Announcements

INCLUDE THE FOLLOWING AMONG OTHER IMPORTANT NEW BOOKS

OF HISTORY

Mr. Herbert Paul's History of Modern England

The first three volumes of Mr. Paul's "History" have been very highly praised for their trenchant, popular, comprehensive and impartial account of public events. The fourth is in preparation for early issue. *Ready in October*

OF BIOGRAPHY

Wm. Garrott Brown's Life of Oliver Ellsworth

By WILLIAM GARROTT BROWN, Author of "The Lower South in American History," "The Foe of Compromise and Other Essays," "A Gentleman of the South," etc. *Ready in October*

Mrs. Barrington's Reminiscences of G. F. Watts

By Mrs. RUSSELL BARRINGTON. Containing five full-page plates in color, four photogravure portraits, and twenty-seven other illustrations from hitherto unpublished drawings. *Cloth, super royal 8vo, $5.00, net. Now ready*

OF PUBLIC INTERESTS

Dr. Hugo Richard Meyer's Government Regulation of Railway Rates

Professor HUGO RICHARD MEYER is said to have proved to be the one man in this country competent to give the Senate Committee on Inter-State Commerce certain vital information. Railroad men quote him as the best posted man on the subject in the world. Unusual interest and value attach themselves to his new book, which is a comparative study of the results of public regulation of railroad rates, pointing out clearly the two opposing policies, with their respective advantages and disadvantages. *Cloth, 12mo. Ready shortly*

Restrictive Railway Legislation By Henry S. Haines

Follows the growth of railroad legislation corresponding with the development of our national railroad system in its several fields of activity: in railroad incorporation, finance, construction, operation, and traffic. *Cloth, 12mo. Ready shortly*

OF TRAVEL AND SPORT

Mr. Sandys's Sporting Sketches

By EDWYN SANDYS, Author of "Sportsman Joe," "Trapper Jim," and "Upland Game Birds." Illustrated. *Cloth, Crown 8vo*

Mr. Outram's In the Heart of the Canadian Rockies

By JAMES OUTRAM. Fascinating adventures and a great deal of incidental information about a region as yet little known even to sportsmen. Illustrated. *Cloth, 8vo*

OF SCIENCE

Dr. Austin Flint's Handbook of Physiology

By AUSTIN FLINT, M.D., LL.D., Professor of Physiology in the Cornell University Medical College. Richly Illustrated. An Atlas of forty-eight reproductions of histological specimens, *in the colors actually seen under the microscope*, is an achievement never before possible in a text-book of moderate price. *Ready Sept. 13*

New Creations in Plant Life

An Authoritative Account of the Life and Work of LUTHER BURBANK, the man who has produced more new forms of plant life than any other ever did. With forty-nine full-page plates. By W. S. HARWOOD *Cloth, 12mo*

BOOKS FOR EDUCATORS

A New Series of Life-Stories for Supplementary Reading and Nature Study work in the Elementary, Middle, and Upper Grades

THE LIFE AND NATURE SERIES

Selected, Edited, and Arranged by CHARLES WELSH

THIS is a series of Life Stories by several well-known writers for use in supplementary Reading and Nature Study in the grades, presenting their work without further editing or adapting than is necessary to fit them for the schools—a brief introduction, showing the place and use of each in the school-work, and a set of questions for the use of teachers in review work at the end of those books that need such. Notes of any kind have been omitted; they are not necessary in the books for the lower grades, and it is better to send the children in the higher grades to the dictionary and books of reference for the meaning of unfamiliar words and remote allusions than to make their work too easy by means of notes.

A complete prospectus will be sent upon request.

TWO VOLUMES READY

THE BEE PEOPLE 5½ x 7½ Inches, 175 Pages. *60 cents net.*

LADY LEE *and Other Animal Stories* 5½ x 7½ Inches, 175 Pages. *75 cents net.*

A SELECTION FROM

The GREAT ENGLISH POETS

With a Critical Introduction and an Essay on the Reading of English Poetry by SHERWIN CODY

Editor of "The World's Greatest Short Stories," "The Best English Essays," "The World's Great Orations," Etc.

TO MR. CODY must belong the credit of having discovered a new field in "practical" literature, the foresight of having realized its possibilities, and the industry to develop it consistently and logically. His compilations have been remarkably successful both in a popular sense and with educators; his books have been adopted in many leading institutions, and to these especially the announcement of this new volume will be most welcome.

It does not conflict with any existing anthology, and it is marked by all the distinctive features which have made his other books so useful—the helpful general introduction, the discerning comments on the work of the great poets, and the instinctive good taste and editorial sense shown in the selections.

16mo, over 600 pages, printed on thin Bible paper. $1.00 net; delivered, $1.09

A. C. McCLURG & CO., PUBLISHERS, CHICAGO.

TIMELY CHILDREN'S BOOKS

THE BIRD-WOMAN OF THE LEWIS AND CLARK EXPEDITION

By KATHERINE CHANDLER 36 cts.

In this centennial year of the Lewis and Clark Expedition, there are few books on this subject suited to young children. Every incident in this little volume is found in the Lewis and Clark *Journals* and is woven into a continuous narrative, through which moves the picturesque figure of the Indian woman—the "wonderful Bird-Woman."

AMERICAN PIONEERS 65 cts.

By WILLIAM S. MOWRY and BLANCHE S. MOWRY

The three great waves of American migration are dramatically pictured in these lives of the adventurous men and women whose careers have made American history—not only discoverers and patriots, but pioneers along the line of thought and education—lawyers, teachers, reformers, nurses. In biographical form, the stories are full of action and anecdote.

LONGMANS, GREEN, & CO., 93 Fifth Avenue, New York

THE CLARENDON PRESS

The Elements of Railway Economics

By W. M. ACWORTH, author of "The Railways of England," "The Railways and the Traders," &c. 8vo, cloth, 70c.

"An intelligent man, if he will apply his mind for a few hours to the study of this little book, may have a clearer understanding of the problem of railway rates than is now manifested by most of our public speakers and newspaper editors. Mr. Acworth has explained a difficult problem with such admirable lucidity as to bring it within the popular comprehension, and he would have been censurable had he hid his light under a bushel. While his book may have been intended for his students at the London School of Economics, and while his illustrations and applications are primarily English, the American people stand in especial need of its lessons, and their need has never been so great as it will be during the coming years."—*The Evening Post, May 8, 1905.*

Minor Poets of the Caroline Period. Vol. I.

Containing Chamberlayne's Pharonnida and England's Jubilee, Benlowe's Theophila, and the Poems of Katherine Philips and Patrick Hannay. Edited by GEORGE SAINTSBURY, M.A. 8vo, cloth, $3.40.

Specimens of the Elizabethan Drama

From Lyly to Shirley, A.D. 1580–A.D. 1642. With Introductions and Notes by W. H. WILLIAMS, M.A. Crown 8vo, cloth, $1.90.

OXFORD UNIVERSITY PRESS, American Branch, 91-93 Fifth Avenue, New York

The Nation.

NEW YORK, THURSDAY, AUGUST 31, 1905.

The Week.

To Japan her meed of praise. She has magnanimously won a moral victory over herself worthy to rank with those compassed by her arms on land and sea. She has revoked her untenable claims, though underwritten by her British ally as wholly reasonable, and apparently regarded by President Roosevelt, in his endeavor to effect a compromise, as at least inevitable and irresistible. Japan may be thankful that Russia did resist, and that the good old rules, "They that take the sword shall perish by the sword" and "Those who dance must pay the piper," are still operative. We need not repeat the reasons we advanced last week why the peace now being formulated at Portsmouth is a genuine peace, and not a breeder of fresh conflicts in years to come. Each side sponges the slate, and the high contracting parties are not the same who began their stupendous trial of strength at Port Arthur and on the Yalu River. The Russia of February, 1904, is dead, thanks to the happy coincidence of pressure from within and without; and with this new Russia it should be Japan's policy to come into friendly relations. She is a natural ally, and never more so than now, when her sea power is shattered and her motive for making hostile demonstrations in Far Eastern waters is removed. The English alliance is factitious, based on fear and hatred of the old Russia, and not on any special regard for Japan. It may have been renewed, as reported, but it is hollow. Japan, like the republic of Venice, has cast the die and committed herself to expansion on the mainland, where to be on good terms with her mighty neighbors is surely the part of wisdom.

The United States has the honor of being the scene of this ever-memorable peace-making. The President has the personal renown of having brought about the conference; but too little is known of the circumstances of his intervention. He will be lauded by the multitude for having assisted in breaking the deadlock, but he entered upon this delicate task in a manner to impugn his impartiality, and with a scheme which had no chance of acceptance. On this it is not necessary to dwell now. The rejoicing of the hour is, that further slaughter has been averted, and that the Old World has composed its differences in the New. If we could hope that this event marks the last great war between nations calling themselves civilized, then there is no holiday in our calendar which we might not exchange for the date of ratification —not even the Fourth of July.

"There never was an hour in all our splendid history," said the ardent Mr. Fairbanks on August 23, "when there was a more acute moral sense among the great masses of our people and more uprightness in their relations of life than there is to-day. . . . There is a widespread determination among the people that those who pollute the law shall be compelled to answer for it." Participating in these sentiments as he undoubtedly does, there must be some unpleasant features about the Vice-President's position. For instance, a new charge has been made against Senator Burton, of taking, with a brother who is not remembered at Washington, $14,000 for representing the Chickasaw Indians before the Interior Department. Then a further addition is made to the roll of Senators "under fire" by the reported discovery that Senator Hopkins of Illinois received from the sanitary district of Chicago fees between two and three times as large as the law allowed. In two years, to be specific, he was voted $24,034, although the statute limited the compensation of any one attorney to $5,000 per annum. These may be called purely technical offences, as were those charged in the original prosecution of Burton. But there could not be better examples of that "thought of personal aggrandizement" so deplored by the Vice-President, who has to preside over the deliberations of these men, and show them that "courtesy" to omit which in the Senate is worse than the crimes of any of its members.

Secretary Bonaparte is by no means so anxious as Van Buren to walk in the footsteps of his predecessor. Another order of Paul Morton's he has just reversed, so as to invite competition from Canadian railways in carrying naval supplies across the continent. Mr. Morton, with a stern patriotism which his railroad friends could not too highly admire, had ordered that contracts should be made only with lines that ran "exclusively in American territory." He could not bear to think of ammunition and stores destined for American ships in the Pacific being sullied by crossing Canadian soil. But Secretary Bonaparte, as a less high-soaring but more business-like official, was desirous of getting his freight bills as low as possible, and so opened the bidding to all hands. Nor was he to be moved from his purpose when some able strategists employed by the American roads went to him and pointed out the grave danger that, if naval supplies were forwarded over foreign railways, "there would be an opportunity for foreigners to obtain information regarding them"! Mr. Bonaparte shouldered even that awful responsibility.

People will more than half believe that the Republicans are afraid of losing Ohio if Gov. Herrick keeps on flying signals of distress. In addition to his attempt to dissociate himself from Boss Cox of Cincinnati, he has now gone on his knees to Senator Foraker, imploring him to come and stump the State. Be it remembered that the Dick-Herrick-Cox machine has been fighting and snubbing Foraker in the most open and cruel way. After he had said that, in his opinion, the renomination of Gov. Herrick would be unwise, the smug little organization took pains to show its hatred for the Senator, and its contempt for his political influence. But it is one thing to carry the primaries and control the State convention triumphantly, quite another to produce the necessary votes at the polls. As the latter task must so soon be undertaken, Senator Foraker has been sent for to come to the help of the alarmed bosses. We presume that a pledge to support him for reëlection to the Senate must be involved, so that Ohio may yet be spared the unspeakable disgrace of seeing Boss Cox fulfil his ambitions and become Senator Cox.

Though somewhat overshadowed by the contest for the Senatorship between Gov. Montague and Senator Martin, the campaign for the nomination for Governor at the Virginia Democratic primary, which was held on August 22, was of unusual interest. Representative Claude A. Swanson, the successful candidate, had to some extent thrown his political fortunes in with Senator Martin, and the party organization undoubtedly helped them both to win. But Swanson had also struck out on local issues that made a strong appeal to the young and progressive element. He was first to take up the demand for more State aid to education, pledging himself to do his best to turn an expected surplus of three-quarters of a million dollars next year over to the schools. As the first test of the new primary law, under a Constitution that has practically eliminated the negro and many ignorant white voters, the result is encouraging. The "white aristocracy of electors," as a Richmond correspondent of the Boston *Transcript* a few days ago predicted they would, "looked a little cross-eyed" at the candidacy of Lieut.-Gov. Willard, which was thought

to be based largely upon a rich man's desire for political honors, while Judge Mann's appeal as the enforcer of the Mann temperance law, was too limited to produce any great effect.

The diatribe which Atlanta's Mayor launched against Chicago's on Thursday before the League of American Municipalities was properly ignored by the delegates. Yet his wild charges were not much more ridiculous than the views of those who see in Chicago's present situation a vindication of the municipal ownership idea. The time to draw conclusions from an experiment is when it begins to show results, and even if all were progressing smoothly in Chicago no one could reasonably have expected anything decisive in less than six months. As a matter of fact, aside from a few preliminary victories in the courts, Mayor Dunne's plans have not by any means gone smoothly. Conditions have forced the Mayor, who made his campaign on an extremely distinctive and positive platform, into substantially the position occupied not only by the rival candidate, Mr. Harlan, but by his predecessor, Mayor Harrison, as well. He is now doubtful of the wisdom of condemnation proceedings to secure the unexpired street railway franchises, and is confining his proposals to those lines on which the franchises have already run out. In other words, instead of treating the traction system as a unit, the city will enter the field as a competitor of the existing lines, but with a sadly incomplete system.

This system will have to be built by private capital in any case. It includes 270 miles of track, and, roughly, covers the city. The Mayor himself considers it "a satisfactory municipal system of street-car lines." But it has been promptly pointed out that several of the streets embraced within this system, some very important to it, were also included by Judge Grosscup's recent decision in the list of streets where the franchises remain in force until 1953. Even waiving this point, the result will be, as the Chicago *Daily News* puts it, that "the double fare . . . will then become in all quarters of the city a prominent feature of travel between one's home and one's place of business. In short, to simplify the traction question, Mayor Dunne would make it more complex. To wipe out existing difficulties, he would make more difficulties. To cure the present bad service, he would invent new abominations." This, after all, may not be quite a fair argument for Chicago. The city made up its mind to endure heroic treatment, if necessary; professed itself to be perfectly willing to undergo hardship to the desired end. But other cities should notice just how heroic Chicago's treatment is likely to be. And, when all is said and done, that city's opinion on the general desirability of municipal ownership is worth no more to-day than the views on warfare of a recruit who has just taken his first enlistment papers.

Mr. Jerome will probably be confirmed in his unwillingness to be a candidate for Mayor by the evidence of divided counsels in the City Committee of the Citizens' Union. One-third of its number voted on Thursday against recommending Mr. Jerome's nomination. Now it is plain that he is in no sense an active candidate. He has not said, as no public-spirited citizen ought to say, that no great emergency could arise which would make it his duty to stand for the Mayoralty. Yet his attitude and peculiar position are such that nothing but an imperious and united demand could swerve him from his announced plan of offering himself to the people for another term as District Attorney. It appears, however, that the Citizens' Union is far from being of one mind on that subject. The Republican organization would pretty clearly accept Jerome for Mayor only as a bitter dose, or with reservation of all rights to vote for him or not as it pleased thereafter. At present, therefore, we do not seem to have the political conditions which would make the nomination of Mr. Jerome for the Mayoralty either possible (from his point of view) or desirable.

That anxious search has to be made for a commanding anti-Tammany candidate, is a biting comment upon the kind of men our party politics is breeding. Is it not extraordinary that, in a city of 4,000,000 people, there is not to-day one man who, by conspicuous public service, by proved integrity and capacity, by hold upon popular confidence and admiration, is spontaneously turned to in such a crisis as the present? In no other field is New York so barren. If it were a question of finding a leader in some great financial undertaking, in a vast engineering work, in scientific investigation, in art, in learning, in philanthropy, dozens of names would leap to the lips. It is only in politics that the careful selection of small men has finally eliminated nearly all the towering figures. The hope of better conditions, in this particular, is one of the things held out to us by Mr. Jerome's independent candidacy. If he succeeds, it will be a signal to men of generous nature and honorable ambitions the country over to come forward and seek that public service for which they are fitted, but from which the boss system excludes them—except at the cost of intolerable indignities and loss of manhood.

The answer of the Equitable Life Assurance Society to the suit brought by Attorney-General Mayer is a virtual admission of all the serious charges against the management. The counsel of the Equitable frankly confesses the misconduct of the officials, and prays that they be compelled to restore the money which they have wasted, lost, or stolen. This statement removes the last vestige of doubt as to the scope of the legislative investigation. Members of the committee have been reported as saying that they were after "conditions, not men." True, the committee is not a grand jury; but in this instance it cannot even begin to uncover the conditions without uncovering the men who created them. People have a right to know how much of the looting is chargeable to the greed of Alexander, Hyde, Depew, and others high in office, and how much to political intrigue; to know, for example, who got that mysterious sum of $685,000. We cannot tell how and why the policyholders of the Equitable were robbed without telling who robbed them. Whether the trail leads to the Republican National Committee or to the State Republican machine and Edward H. Harriman and Benjamin B. Odell, jr., it must be followed to the very end.

In the Oneida district of Pennsylvania on August 23, 800 miners were suspended because they "knocked off" work on the occasion of John Mitchell's visit, in order to give him an elaborate reception. President Mitchell denounces this as "tyrannical," and promises that the "rights" of the men shall be protected. On what theory the privilege of parading before the union leader during the working day can be called a "right," we are at a loss to see, unless, indeed, Mitchellism is a religion, and the suspension of these men interferes with "the free exercise thereof." Just so a Mohammedan's employer must allow him certain periods for prayers. Or, possibly, it may be argued that the clause of the 1903 agreement providing that "no suspension of work shall take place by lockout or strike, etc.," implies that suspension of work *shall* take place for other reasons, such as a union jamboree. Natural as is the desire of the mine workers to do honor to a beloved and successful chief, it is incompatible with the commonest rules of industrial organization to stop work for this purpose whenever the spirit moves.

John Mitchell at Tamaqua on Sunday, explaining his demand for recognition of the union, said that he had found to his satisfaction that there could be no "permanent industrial peace" without it. What is his view, then, of the present conditions in the mining region, where the Board of Conciliation has worked for the last two years with conspicuous

success? The award of the anthracite coal strike commission in 1900 expressly adjudged and awarded: "That no person shall be refused employment or in any way discriminated against on account of membership or non-membership in any labor organization. . . ." Certainly the anthracite region has never borne outwardly a more peaceful aspect than in the last two years and a half. Differences were never settled with less friction. Probably the condition of the miners themselves was never so good, even if the steady employment at the mines has enabled the operators to provide themselves with stores of coal against a future strike. But all these considerations are as nothing beside the fact that the union must have something specific to fight for. Membership can be drummed up at the promise of a battle when a merely prudential organization among this class of workmen would be in danger of falling to pieces. Mr. Mitchell may reiterate that his mission is "one of peace"; but the knowledge that his following grows in times of strife but declines when things are quiet, does not naturally encourage the leader to play the part of pacificator.

We have been almost ashamed to comment upon the outcry in the South over Booker Washington's having sat down to dinner with Mr. Wanamaker in a hotel. One hates to believe that so many of his fellow-countrymen can be so childish. We had also hoped that Southern people had taken to heart the lesson of their silly attacks upon President Roosevelt for eating with Mr. Washington. But here comes the Charlotte *Observer* asserting that "Mr. Wanamaker's offence is greater than Mr. Roosevelt's." This, it is explained, was because a dinner in a public room is "purely a social function," and "a negro was unmistakably on a social equality." Mr. Washington, the *Observer* admits, is "a good negro; more than that, he's a great man," but still, the purity of the race, etc., etc. And it is men capable of such sentiments who complain if they are called backward and provincial in setting up standards which the rest of the civilized world has outgrown.

The advocates of an international system for collecting agricultural statistics and issuing crop reports have made the most of this summer's cotton-report scandals. David Lubin of California, speaking before the Statistical Institute at London, declared that, statistical science having secured a stable medium of exchange, its next task should be to "eliminate from dangerous price fluctuations the most important things of exchange, the things known as the staples of agriculture." Continuing, he reasons: "Under the proposed Parliament or International Institute of Agriculture it will be the farmers of the world and the consumers of the world who will determine the price between them." But will not the chief tug of war take place between the various crop-producing areas? If our Southern States can be roused to wrath by our own cotton estimate when they consider it too large, what will be their feelings when such a bear report emanates from an international bureau in which cotton-buying England and Germany have a hand? Imagine the influences that would seek to affect the international grain market in such a Presidential year as 1896, when low prices for farmers' products might have turned the election the other way. Whether the substitution of international jealousies and rivalries for the speculator's wiles will greatly improve matters, is a point which the champions of the suggested system need to consider.

While we are palavering about a trade agreement with Germany, France has gone to work and made one with Russia. The two situations are not unlike. France takes large quantities of raw materials from Russia, as Germany does from the United States. Something like $40,000,000 a year of Russian lumber and flax and cereals and oil enter France. French exports to Russia, like Germany's to us, are mostly of manufactured goods, and are comparatively small in amount. About $9,000,000 was the total last year. Of course, the thing the French commissioners in St. Petersburg had to debate about was, not the desire of the two peoples to exchange goods at a profit to each, but the efforts of the two Governments to make trade difficult—that is, the tariff. The Russian scale of customs duties is high and advancing. The French have their maximum and minimum tariffs, and their sacred protectionist system as well as we. But an agreement, so it is reported, was come to; tariff barriers are to be mutually lowered. Protection is mighty, but business is mightier. When American business men really become angry, and demand that the tariff get out of the way, they will be surprised to see how meekly it will take its hat and go.

Dr. Karl Peters, who recently returned to Germany from his South African expedition, is more than ever convinced that that part of the world was never intended for white men, even though there are now railways and towns where Livingstone found a wilderness to explore. He has expressed his opinion that the whole of South Africa is unsuitable for agricultural purposes of a permanent kind, and that therefore the scheme of the "United States of South Africa" will remain a dream, as the country, being a mining region, has a too fluctuating population. It has become more and more markedly a miner's camp; and so long as the supply of diamonds, gold, copper, iron, coal, petroleum, etc., lasts, it will be in part a white man's country—after that, it will revert to the dark races. Already the so-called Ethiopian movement, with the motto, "The black continent for the blacks," is making headway rapidly. The champions of it are mostly ministers of the Abyssinian Church, and the Zulu press is used as well as the pulpit, with results which Dr. Peters calls "simply astonishing." The treatment of the blacks by the English, with their so-called "contract" system, resulting in conditions not unlike slavery, is as oil on the flames. Noteworthy also is the growth of the Asiatic element in Africa. Hindus and Chinese are everywhere. There are already entire towns of Hindus, and the suburbs of Capetown and Johannesburg are Hindu. Dr. Peters sees in this invasion "the first great reaction of the temperance nations against the alcohol-drinking Europeans," providing a rich field for future conflicts.

Sir Martin Conway makes an appeal for contributions from the United States, as well as England, in aid of the newly formed "League for the Preservation of the Beauty of Switzerland." Its aim is announced to be to prevent that "building of hotels, making of railroads, enclosure of waterfalls," etc., by reason of which many of the most beautiful spots in the Alps are in danger of losing a part of their charm. Sir Martin remarks that the Swiss imagine that all that has been done is "agreeable to the tourist-crowd," but he warns them that they are killing the goose that lays the golden hotel-bills. Just what is to be done, however, he does not indicate. His real complaint, we suspect, he does not openly state. It is that there should be a tourist-crowd at all. When some people say natural beauty, they mean an exclusive opportunity to enjoy it. And there is much to be said for that view. How can a landscape seem truly beautiful with a group of those German parvenus in the foreground whom *Fliegende Blätter* so loves to caricature? What mountain or valley can really appear of unsullied beauty when beset by agile Americans who have been "doing some jumping" through Italy, and are now furiously covering their Switzerland, travelling every night, and staring nature out of countenance every day? Modern social conditions are really at the root of Sir Martin Conway's trouble, and they cannot be changed. The man who insists upon having beautiful nature all to himself has, in these days, either to "git up airly," or to retire to a more and more inaccessible peak in Darien.

GOVERNMENTAL AUTOMATISM.

The demand of the times is for graft-proof systems of administration. Convinced by sad experience that untrustworthy men will get into office, and despairing of raising the standard of public morality, the aim of a certain school of statesmen seems to be to invent plans that can be administered by dishonest men, if worst comes to worst, without serious harm to the public interest. A minor, though very apt, illustration of this tendency came last week from South Carolina. A legislative investigating committee has discovered that the local agents of the State Dispensary have sought and received large sums of money and costly presents from brewers and distillers for putting their particular brands of liquor on sale. Senator Tillman, father of the system, practically confesses the abuse, and offers a remedy. Is it the appointment of better men for local dispensers? No; but the elimination of all the commercial brands of beer and whiskey at once, by having the State bottle its own liquors. "If we have to discriminate," runs the argument, in effect, "dishonesty creeps in. Let us, therefore, give everybody the same thing, whether it is what he really wants or not."

There is hardly a line of administration in which a similar theory cannot be traced. The matter of buying supplies is the most conspicuous instance. The Post-Office has to fasten its letter-boxes somehow. It picks out a particular box-fastener, and we have Machen and Lorenz and the Groffs to deal with. The Navy Department wants submarine boats, and, because there is more than one kind, we have a scandal in Congress. But the statutes try hard to minimize the possibilities of such happenings. Every man trained in private business methods who enters Government service chafes under the necessity of advertising for bids for every trivial lot of supplies, and taking the lowest, whatever his private opinion may be of the bidders. Read the restrictions which every city charter or administrative act throws about the purchase of patented articles to see how much thought has been given to heading off corruption.

In administration, every detail tends to reduce itself to a hard-and-fast formula. The efforts of Mr. Madden, the Third Assistant Postmaster-General, to purge the lists of publications entitled to the second-class rate probably resulted in as much ill-feeling and recrimination as any bit of governmental activity in recent years. A librarian or a buyer for home perusal has little doubt as to what publications are "legitimate" and what features objectionable. Yet the efforts of the Department to draw the line led it into all manner of difficulties, with unreasonable and inconsistent rulings. If conditions are becoming more satisfactory, it is because absolutely definite rules as to sample copies, premiums, prize offers, etc., are being worked out.

It has been assumed by many students of the railway-rate problem that Government regulation would mean, within a short time, a system of zone or distance tariffs, not because this is desired in itself, but because of the sheer inability of any commission to stand the pressure of rival localities. Favoritism and inflexibility are thought of as the sole alternatives. Some of the safeguards alluded to have been tested by experience, and no one would dream of upsetting them. The merit system itself rests on the same fundamental theory. But in the general effort to make laws that are virtually self-enforcing, there may be danger of forgetting the fact that we are merely exchanging specific responsibility of the executive for general responsibility of the legislature. And the legislature itself has wrestled just as hopelessly with the everlasting difficulty.

The case of national pensions contains the whole story. Our system was demoralized first by the difficulty of deciding whether admitted disabilities were or were not traceable to the war. So Congress in 1890 said: "Never mind whether the veteran's ills are due to the war or not. Give him the pension if he is disabled." But "disability"—a term most elastically defined—had still to be discovered, until the famous Order No. 78 said, in effect: "Never mind whether he is disabled or not. Give him a pension if he is sixty-two years old." Congress retained the right to alleviate the harshness of existing law by passing private pension bills for those whose needs the statute did not precisely meet. These private bills are defended as a sort of system of equity, tempering the rigors of the law, giving more heed to all the circumstances of the individual case. Yet what is the result? Simply that every Congressman or Senator is told how many such bills he can have in a session. Injustices may cry to heaven in one district, while another may not have a surviving Unionist unpensioned; but the quota rule prevails.

The whole practice of legislative log-rolling has its origin in this same weakness of officialdom—confessed inability to exercise wise discrimination. Congress as a whole could not muster the courage to say squarely: "Mud Hen Creek has no commercial importance and no possibilities, and doesn't deserve a dollar of the public money." So every other member claimed as much river and harbor money as the Mud Hen Creek statesman, and some of it went for extremely good purposes. And, if the shameless scramble for "pork" has largely been done away with—a most important reform for which the present chairman of Rivers and Harbors deserves much credit—it has been by laying down hard-and-fast tests which any stream must meet in order to receive improvement.

After all is said and done, we must trust somebody in the public service. If we reduce the duties of an executive officer to the mere application of a yardstick to the matters that come in his way, we are simply transferring our faith to the authority which provides the yardstick. Government by the methods of the slot-machine, though the logical end of the attempts to make Government functions automatic, might not prove to be the best thing in the world.

REFORM BY PRECEPT.

We are in the habit of looking to the annual address of the President of the American Bar Association for direct dealing with the moral and social problems of the hour. Professor Tucker did not, last week, depart from this good precedent. In one passage of his speech he took up specifically President Roosevelt's Harvard complaint against those members of the bar who, for great fees, prostitute their great abilities to the service of unscrupulous wealth in the working out of "bold and ingenious schemes to evade the laws." Partially admitting that the charge is well founded, Professor Tucker proposed a remedy for the evil. It is the adoption in all law schools of "an enlarged and comprehensive course in 'legal ethics,' to be taught by men of lofty ideals."

With all respect, we submit that this is quite to mistake both our malady and its cure. We are not perishing for lack of knowledge. Every shyster lawyer who extorts an illegal fee from a poor and ignorant woman, as well as every "leader of the bar" who gets rich by devising methods for wealthy scoundrels to cheat and steal and yet go unwhipped of the law, knows perfectly that he is doing a disreputable thing. He does not need to be told that his acts are as repugnant to the ethics of his profession as they are to elementary morality. It is not ignorance that we have to attack, but moral perversity. Motives, passions, desires are at fault, and social standards are awry, not intellectual perceptions. And whenever a society is suffering, as ours is to-day, from topsy-turvy morals and blinding ambitions, it cannot be won back to clear honesty and true estimates of life by the exhortations of a thousand pulpits or of ten thousand professors.

Education as of itself a moralizer of whole peoples is no longer preached by men who try to keep their brains clear of cobwebs. Against Professor Tucker, we cite Prof. William James: "Fifty years ago, the schools were supposed to free us from crimes and unhappiness; but we do not indulge in such sanguine hopes to any such extent to-day." And in the address from which we quote,

this loyal son of Harvard added—never more loyal than when he said it—"There is not a public abuse on the whole Eastern coast which does not receive the enthusiastic approval of some Harvard graduate." Let Lodge, let Penrose, let James H. Hyde deny it! Young men are not to be fooled by mere words. You may tell them in the law schools till you are gray and bald and bent that the legal profession ought to be a beacon of the purest honor, a bulwark of morality and the saving salt of the commonwealth; but so long as students see a Depew pocketing unearned and suspicious thousands, yet accounted one of the most successful men of his generation, honored by State, Church, and University, your moral platitudes will have no more effect upon them than the idle wind. Not what you say, but what he does, will sway the youthful mind.

We had, on the same day with President Tucker's address, a striking acknowledgment of the futility of preaching the purest moral and religious doctrines to men off whose hearts they rebound. The Rev. Dr. Morgan, the eloquent and devout English clergyman, left behind him as he sailed a searching rebuke of American church-goers. He had detected an alarming lack of influence upon their daily lives of the solemn truths which they professed to believe. Creed and practice are not at all articulated. Business men sit twice a Sunday under the tremendous utterances of prophet and apostle, only to go out and all the week cheat, if not with holiness and zeal, at least with entire unconsciousness that their religion has anything to do with the exchange and the counting-room. Lord Melbourne himself could not be more indignant than they at the pretence that Christianity has any right to invade private life. And we know how shocked politicians always are when any minister essays the Nathan rôle with them. They make literally their own the old complaint of the satirist, Bramston:

"Not long since parish clerks with saucy airs
Apply'd King David's Psalms to State affairs."

But if precept thus has so little reforming power, where shall we turn for help? To example. Let Messieurs the great lawyers commence. If they would reëstablish noble ideals in their profession, let them display them in their own persons, rather than urge law students to do as they say, not as they act. Let the leaders of the bar assert their leadership in the exemplification of unbending probity, scorn of rich men bearing bribes, eagerness to ostracise or chastise every trickster and money-grabber in their profession, readiness to volunteer their services in defence of public rights, emphasis upon the rewards of a good conscience and approval by the discerning rather than upon $100,000 retainers and being let into the "good things" of the bad men they help steer clear of jail. We would point also to the silent working out of the great moral laws which the Creator has written in the heart of man and stamped upon human society. The true standards have a terrible way of asserting themselves in the lives even of men who snap their fingers at them. Awful warnings are, from time to time, given to a society in which morals seem hopelessly confused. The sight of eminent evildoers caught at last in the machinery of the mills of the gods avails more than all the moral teachers put together. It is Providence itself doing the teaching and flogging at home. It is in this view that we have to regard our late exposures of lights of the law and paragons of society and pillars of the church, as immensely tonic. We firmly believe that the present plight of Senator Depew is a greater and more impressive contribution to "legal ethics" than could be made by all the lecturers in all the law schools talking moral abstractions for a lifetime.

THE LAST OF ADDICKS.

The news that J. Edward Addicks is disposed of as a political factor in Delaware, now carried beyond ordinary rumor by the desertion of his chief lieutenant and proxy Senator, Mr. Allee, brings a sigh of happy relief to the country, which has anxiously watched the sixteen years' fight against this adventurer. In a peculiar sense, his campaigns have been the concern of decent citizens in every section. Other States might be bought, but none by such sordid and shameless methods as were applied to Delaware; other preposterous candidates have aspired to Senatorships—yes, and won them—but none whose unfitness was so gross and palpable, whatever standard was to be applied. Thus not only did the name of Addicks become a synonym for everything that was evil in American politics, but it is to be feared that other communities comforted themselves by the thought that their own political conditions, however bad, could not be compared with those which were smelling to Heaven in the old Blue Hen State.

The original choice of Delaware as a field for the operation of buying a Senatorship is the first feature of this amazing political story to demand attention. On the score of venerable traditions in politics, Delaware should have been an unpromising place to begin. Its politics had long been dominated by powerful families, like the Bayards and the Saulsburys, and it had sent an uninterrupted succession of Democrats to the Senate for thirty-two years when Addicks came on the ground. Yet under the surface were elements of weakness. Delaware was small; the $250,000 which Addicks admits having spent in his campaigns would be the equivalent of more than $9,000,000 in New York. Then the rural counties, which had far more than their just representation in the Legislature, were wretchedly poor and contained a large negro element. Vote-buying—though on a relatively small scale—had long been indulged in by both parties. A State where common speech made the distinction between a man's "charging for his vote" and "voting his sentiments," was not entirely unprepared to receive a corruptionist. Moreover, while the southern counties had declined in prosperity, New Castle County, which contains the city of Wilmington, had grown rapidly in wealth and population and had developed manufacturing interests which predisposed it to Republicanism. Addicks undertook to obtain a Senatorship in the same way that he would have obtained a gas charter from the same Legislature.

It is not quite correct to credit Addicks alone with the "redemption of Delaware," for on the last day of December, 1888, when, at midnight, he made his appearance at Dover, the Republicans had already elected a Legislature. It was easy to laugh then, as everybody did, at the pretensions of this stranger. But to review the events of the years that follow is to admire the pluck and determination of the men who stood fast against pressure that was continually becoming stronger. In 1889 Addicks had no votes at all in the Legislature. In 1891 there was no Senator to be elected, and in 1893 the Legislature, chosen in the year of the Democratic landslide, returned Senator Gray. Even in 1894-5, Addicks had only six adherents on the Senatorial ballot. Two of these fell away from him, but by parliamentary trickery these four men contrived to prevent the choice of Col. Du Pont, who lacked a single vote of a majority when the session adjourned in May. This year was the critical one in the fight. Not only did it see the formal split between the factions, but the rallying cry, "Addicks or nobody," then began to carry a real menace.

Thus far, the anti-Addicks men had been in the comfortable position of any established organization which is repelling an interloper. The most trying test of their temper was to come. After 1897, when the Democrats once more chose a Senator, Mr. Kenney, the Republicans again secured a Legislature. This time there were more Addicks men than Regulars. He had 18 Republican votes out of 31, but 27 were necessary to elect. Failing to make headway in the Republican party, he turned to the Democrats. Three of them voted for him on the final ballot, and it has always been believed that others were willing to, but had not the courage in the face of the cries of "Judas" and the threats of violence that accompanied the rollcall. Again it was "nobody"; but Addicks now held the whiphand.

In 1900 there were rival Republican delegations to the national convention, as there had been four years earlier, but this time the Addicks men were seated. The influence of Mark Hanna and of President McKinley himself was by this time on the Addicks side. One of the Senatorships was offered to Samuel M. Knox, the anti-Addicks leader, as the price of his acquiescence. Six other Regulars were won over, and Addicks at last had 22 out of the 27 Republican votes. But he still lacked five, and those five were not to be had at any price. On November 11, 1902, President Roosevelt appointed William M. Byrne, Addicks's unsuccessful candidate for Congress, United States District Attorney; and Postmaster-General Payne, the practical politician of the Cabinet, announced that the Administration was to recognize the "Union Republican" faction on account of its numerical superiority. In the next Legislature Addicks, now claiming that his "regularity" had been acknowledged by every party authority competent to certify it, owned 21 votes. This time a prolonged deadlock was ended by the choice of an Addicks man, Allee, for the long term, and a Regular, Ball, for the short, of which only two years remained, so the Legislature of 1905 had again a Senatorial vacancy to fill. But again Addicks lacked five votes of the consummation of his designs.

That Addicks is not now a Senator is not to be credited to Delaware as a whole—it was complaisant enough—but to the group of steadfast men, a minority of their own party, who resisted, year after year, every form of political pressure known to this country. They, led by a business man, a stock dealer, two manufacturers, two farmers, and a telegraph operator, have saved their State from the long-threatened degradation.

TRANSCONTINENTAL RAILWAY BUILDING.

Two projected transcontinental railways, the Grand Trunk Pacific in Canada and the Western Pacific in the United States, are now likely to be carried forward to speedy completion. The financial support of each undertaking seems to be provided, and contractors are preparing estimates. Each line promises to have an important influence, not only upon the territory through which it will run, but upon Pacific Coast and Oriental commerce.

The Canadian Pacific was opened throughout in 1887, and it has since built and obtained control of a number of feeders and branches. The total length of the system, including leased lines and lines under construction, is given, in 'Poor's Manual' for 1904, as 11,019 miles. The road is now very prosperous: the stock is quoted at 160, though in 1904 it was as low as 109. The evidences of this prosperity are abundant. Two through passenger trains from Montreal to Vancouver are run each way daily. This year the rush of travel has been so heavy that the trains have often run in at least two sections, and the Canadian Pacific hotels in the Rocky Mountain resorts have been compelled to turn away many travellers. The low rates to the Lewis and Clark Exposition at Portland have, of course, drawn large crowds, but, aside from this special cause, the rapid settlement of the wheat belt and the North Pacific coast assures a steadily growing passenger traffic. No expert testimony is needed to explain the source of freight earnings. From Winnipeg to Calgary the country is becoming rich. The volume of advertising in the Winnipeg newspapers is one of a thousand signs. On every siding, cars are loading and unloading freight. At every junction and distribution point, such as Regina, Medicine Hat, and Calgary, vast stocks of agricultural machinery are in plain sight from the car windows.

The Grand Trunk proposes a line through the country farther to the north. That there is room for a railway there, that the business is increasing so swiftly as to furnish enough for both railways, no one seems to doubt. Indeed, the extension of the Grand Trunk ought, if precedent be of any value, to be a benefit to everybody concerned. The United States was importing wheat last autumn; and it cannot be many years before the world will require the products of all the wheat lands which may be opened by both the Canadian Pacific and the Grand Trunk.

On this side of the border the Western Pacific is hailed by residents of the Pacific Coast as the long-desired rival of the Southern Pacific. Whether it will be an active competitor remains to be seen. The north coast is in the hands of the Hill lines, which have ports at Seattle, Tacoma, and Portland. The Southern Pacific also runs into Portland, and it controls practically all the railway traffic in California, where its relations with the Santa Fé seem entirely amicable. California has not submitted to this monopoly without many protests, but they have hitherto proved unavailing. In the old days the mine owners bitterly complained that the railways were eating up their profits, and there was more or less hostility between the "mining group" and the "railway group" of capitalists. The farmers and fruit-growers, who are now adding so much to California's wealth, are in a state of chronic rage against the Southern Pacific. It has tied itself up to a private-car monopoly, which, the farmers declare, charges extortionate rates for carrying fruit in cold storage to the Eastern markets. The merchants of San Francisco, Los Angeles, and the smaller cities and towns present their grievances in still another bill of particulars. The Southern Pacific controls coastwise steamships. It has also been deep in State politics. Indeed, the picture of affairs in Frank Norris's 'Octopus' is by no means pure fiction.

The news that, under the organization of the Western Pacific, the Gould system will reach out from Salt Lake City to the coast and furnish a through connection to the Atlantic seaboard, has therefore provoked extraordinary interest in California. The papers have been full of it. Men on the street are eager to discuss it. No doubt a road which should deliver California from the Harriman monopoly would be a strong stimulus to the development of all the industries of the State and to trans-Pacific trade. One need not accept the extravagant estimates of enthusiasts as to the capacity of the Pacific Coast to support a large population. One may have his doubts about twenty or thirty millions of people in the near future, but he can still believe that two million residents in California and three-quarters of a million in Oregon are far below the possibility. Both States contain many undeveloped resources. Capitalists, as well as farmers, are naturally reluctant to put their investments at the mercy of a corporation which has provoked so much hostility as the Southern Pacific. The fruit-grower who finds that icing and freight charges to New York amount to more than the price of his fruit, refuses to put any more land under cultivation. If the Western Pacific does nothing more than force the Southern Pacific to adopt a more conciliatory policy, it will be a great boon to the whole Coast.

HYMNALS, OLD AND NEW.

A new hymnal is announced by the Methodist Book Concern, a book which must soon find its way into all Methodist churches, North and South. A volume which reaches so many people—over four million members, with an equal number of adherents—is an educational force to be reckoned with; to hundreds of thousands it will be a handbook of poetry, music, and religion. In Methodist—as in other non-liturgical—churches, the Bible lessons and the hymns are the most elevating part of the service. In neither prayer nor sermon can any preacher of the denomination hope to offer such a stimulus to mind and soul. Nor can the minister take offence when members of his congregation flee from the commonplace inconsequence of his discourse, and take refuge in the pages of the hymnal. Hosts of sincere worshippers find church tolerable because they can close their ears to the droning exhortation, and commit to memory a hymn or two.

This we say, in spite of the fact that

so much religious poetry is neither religious nor poetic. Hymn-books are overloaded with stuff which has nothing to recommend it but doctrinal soundness. Fervor of emotion and beauty of diction are absolutely wanting. In this matter, however, there has in recent years been considerable improvement. The late Rev. Charles S. Robinson, for example, compiled a hymnal which was a decided advance on those in general use. The Episcopal Hymnal, published about ten years ago, marked another step forward; but it contains too much—679 hymns. The new Methodist Hymnal has 717; but it supplants a collection containing 1,117—an appalling mass of mediocre verse. The difficulties of discarding any hymn, once admitted, are apparent. However banal the words or flat the jingle, they have pleased some people, have become hallowed by searching of heart, high aspiration, hope of eternity, and sorrow for the dead. The joint commission, which saved but 477 of the old hymns and added 240 new, has therefore shown uncommon firmness.

Of course, not all the new are recently written; they are drawn from all sources, ancient and modern. The whole of the last century, with Heber, Keble, Newman, Bonar, Montgomery, Faber, and Neale has produced hardly 240 worthy hymns. Two of the new hymns, Tennyson's "Crossing the Bar" and Kipling's "Recessional," are sure to provoke adverse comment. Both are solemn and in a way devotional; but "Crossing the Bar" seems almost too elaborately metaphorical, too artificial, to make a direct and telling appeal, while the "Recessional" owes something of its vogue to the fact that it isn't a Barrack Room Ballad. Earnest souls have accepted it as proof that the profane Kipling of "Fuzzy Wuzzy" has reformed, and is bringing forth fruits meet for repentance.

The world is yet waiting for a volume of hymns on the scale of Palgrave's 'Golden Treasury of Songs and Lyrics,' the choicest, and nothing else. The number of selections would probably range between two and three hundred. The task has been more than once attempted, but never with great success. No denominational hymnal can supply the want. That work is compiled with an eye to the traditions and temperament of a sect. The keen theologians who pass upon the work scent Arminianism. Socinianism, or other vile heresies in the most innocent and odorless syllables. As a critic of this Methodist Hymnal notes, "Hymns, flawless in themselves and eminently congenial, say, to Presbyterian or Congregational worship, might not meet the demands of the Methodist spirit of worship." The men who undertake a small anthology of hymns, then, must be blessed with a catholic and unprejudiced taste.

The phrase "spirit of worship," just quoted, suggests another limitation. All hymns are religious verse, but all religious verses are not hymns. A metrical statement of the doctrine of the Trinity or the theory of atonement may be as valueless for purposes of worship as a metrical statement of the proposition that the square described on the hypothenuse of a right-angle triangle is equal to the sum of the squares on the other two sides. Indeed, too many of the hymns written in periods of religious controversy have been weighted down with doctrinal theory. John Wesley himself, in the preface to his collection of hymns, dated 1779, boasts that these hymns "contain all the more important truths of our most holy religion, whether speculative or practical," "illustrate them all," and "prove them both by Scripture and reason; and this is done in a regular order." That, indeed, is the defect of the book; it contains too much that is merely expository, argumentative, or hortatory. Take, for example, two stanzas:

> "Lovers of pleasure more than God,
> For you He suffer'd pain;
> Swearers, for you he spilt His blood;
> And shall He bleed in vain?
>
> "Misers, for you His life He paid;
> Your basest crime He bore;
> Drunkards, your sins were on Him laid
> That you might sin no more."

These lines might easily be matched in all of the older denominational hymnals.

Some of the most inspiring hymns were the product of the early ages of faith. Nothing of the sophisticated Victorian era has touched their simplicity and vigor. When hell was a pit of physical torment and heaven a city of pearly gates, the Christian's fears and hopes were absolutely definite. For Bernard of Cluny there was in all reality a "Jerusalem, the golden, with milk and honey blest," a "sweet and blessed country, the home of God's elect"; and Bernard's cry came from his heart:

> "For thee, O dear, dear country,
> Mine eyes their vigils keep;
> For very love beholding
> Thy holy name, they weep."

No vague remarks on ethics in this—no thin generalizations about the pleasure of doing good, or about joining the choir invisible. The hymn-book that shall gather up the best of this passion of worship is yet to be made.

CHINESE STUDENTS IN JAPAN.

SEUL, July 21, 1905.

Ten years ago, when China fought Japan, the Cantonese, had you asked him what he thought of the war, would probably have shrugged his shoulders, or inquired, in turn, "What war?" It was the Peking Government, not the Chinese nation, that was battling in Mantchuria. To-day we find the merchants in every treaty port threatening to boycott American goods, students refusing to attend American schools, house boys declining to serve American masters. China is waking. She may not fight with machine guns and automatic pistols, but she is capable of waging a war of dollars. The Chinaman is a man of commerce, and in a mercantile battle would be no mean antagonist. The Japanese victories have undoubtedly been responsible, in a measure, for this sudden assertion of China's dignity, but the Japanese schools will have a greater effect than her battleships and her undefeated armies.

In January, 1905, there were 2,409 Chinese students in Tokyo. By the end of June that number had almost doubled. More than half are self-supporting, the others have either been sent by the national or provincial governments, or are the holders of scholarships founded by groups of officials and literati. The students are of all ages, from boys of thirteen, preparing to enter the Japanese middle schools, to men of forty and over who have already worn their official buttons and held office at home. There are Chinamen in practically all the Government institutions, and in a large number of the private, while a few schools have been especially established for their instruction. The greater proportion study engineering, law, or military science. Medicine claims many, and railroading, photography, weaving, printing, dyeing, and soap manufacturing are less popular. The Chinese Government allows each of its students twenty-five yen per month. This sum is paid to the school authorities, and they in turn meet all expenses, allowing the pupil a certain sum for incidentals. Japanese students of the same class are generally allowed fifteen yen a month, for eight yen pays for a four-mat room and the cheap food on which the student is expected to live.

All students are nominally placed in charge of a Superintendent of Education, or, in case none has been appointed, under the Chinese Minister at Tokyo. A set of rules regulating the acts of students was prepared by Chan Chih Tung, the Hankow Viceroy, and was signed by Mr. Uchida, the Japanese Minister to China. The agreement never seems to have been regarded very seriously by the Japanese. It gives elaborate directions governing the entrance of the student into Japanese schools—that he must attend only those institutions recommended by the Chinese Minister, and that the school shall admit him only upon presentation of a certificate issued by the Legation. Certain penalties are also provided for the non-observance of the above, but the Japanese authorities refused to interfere where pupils were accused of offences purely political in nature. In ordinary matters, of course, the students have the same status as other resident Chinamen. Of the many articles, the only one calculated to render the whole effective, deals with the recently established system of "rewards." For a very serious breach of the rules, only, would a student be punished by his provincial officials on his return to China. Obedience, however, brings laurel wreaths and pleasant places. Chan Chih Tung hopes to accomplish his ends by appealing to the ambitious rather than by penalizing the disaffected.

The Emperor has proclaimed that Japanese degrees are to be recognized as the equivalent of the old Chinese Literary Grades. Men whose conduct has been exemplary, and who have entered the schools specified, will be given, upon a reëxamination, which may be a farce, Chinese degrees

as well. Five years' study and a middle-school diploma entitle the holder to the Kungsheng grade. A student who, after eight years, secures a certificate from the higher schools is awarded the Chüjen. Three years' further study and a university degree call for a Chinshih. A Master's degree in addition claims the Hanlin, while a Doctorate insures an appointment in the Government service, given only to Hanlins of standing. In addition to the above it is provided in the new regulations that those who had completed their studies before the regulations came in force, shall, upon reëxamination, be given the Chüjen degree, and that those who have not graduated in Japan, but have been in the Government employ, may be credited with their term of actual service.

For years Chinese students have been going abroad. The Government sent a number to America in 1872, but later recalled them, as it was feared that they would return to their own country too fully impregnated with Western ideas. Many went to England, others to the Continent, most of them men from Canton and the Yangtze provinces. Chinese interest in the outside world was growing, and the war with Japan opened the eyes of many a thinker. In 1896 a number of Chinese students went to Japan. In 1898 the authorities of Chekiang, Kwantung, and Kiangsu sent a few of their fellow provincials to the Island Empire, and they were followed the next year by others from the north. After the *coup d'état* which brought Kang Yu Wei's brief power to an end, a number of young men went over at their own expense. They were anxious to learn something of Japan's progress and of those modern ideas responsible for her great development.

When the Boxer trouble broke out, there were a number of Chinese students in Tokyo. They had not, at that time, any particular organization, save the association common to all Chinamen abroad. One of the Secretaries of Legation was notoriously a frequenter of tea houses and places of ill repute. The students resented this, and gathered one day at the resort where he was known to be. They drove him out, and then complained to the Minister, stating that, while their country was in a parlous state, with foreign troops occupying her capital, it was not a suitable time for their officials to be dissipating and making merry. This was the first occasion on which the students had taken united action. Tsai, the Chinese Minister in Tokyo, was forced to reprimand his assistant, and the incident was closed. The diplomat, however, cherished towards the students an ill will which he displayed two years later.

Up to 1900 the Central Government had taken little notice of the student movement—each province was maintaining its own group. In 1902, however, there was further trouble between Tsai, the Minister, and the young men in the Tokyo schools. A number of them, self-supporting, desired to enter the Military Academy. The Japanese authorities refused to receive them unless they were recommended by their Minister. The Peking officials were at that time much worried by the activities of the so-called Reform Societies in the South and West, and were anxious that only Government nominees should study the art of war. Tsai, therefore, had been instructed to refuse all requests for permits. The applicants, learning that the Minister's refusal was prompted by the Home Government and not by any unwillingness on the part of the Japanese to admit them, went to the Legation *en masse*. Thirty men refused to leave the premises, and for two days sat there without food waiting for their chief to relent. The police were finally called in, and two of the ringleaders sent back to China, whereupon the whole body threatened to leave Japan. A Superintendent was appointed, and the matter was finally smoothed over and the desired permits granted.

Nineteen hundred and two was an eventful year for this little scholastic community. They managed to protest successfully against the placing of Formosan Chinamen in the Aborigines Village at the Osaka Exposition. On the Kuantung Viceroy Wang Chih Chun's recommending that French troops be called in to quell the rebellion in his provinces, the students wired their Government demanding that the traitor be cashiered. The recent attempt on Wang's life in Shanghai was an outcome of this affair. In the year following, the number of students had increased, and they seemed to take an even greater interest in their home politics. A club was started with 274 charter members, at which topics of the day were discussed. The "Supao" * case was considered in mass meeting, and subscriptions were raised to assist in paying the costs of defence in the Shanghai courts. Shen Chen, the reform journalist who was beaten to death by the orders of the Empress Dowager, was worshipped by many as a hero. Owing to the failure of the Japanese to include the Dragon flag in the decorations, the Chinese students refused to attend the graduating exercises at the Military Academy, even after the mistake had been rectified. When Russia, in April, 1903, ignored her evacuation agreement, the so-called "Chinese Students' Army" was organized. About three hundred men drilled regularly for three months until the Japanese authorities requested them to change their names and cease their exercises. When the 8th of October found Russia still in Newchwang, the men in Tokyo telegraphed Yuan Shih Kai, the Viceroy of Chihli, crying for war and volunteering for the struggle. The Club is now the centre of Chinese student life in Tokyo. Each member, and there are some 4,500, pays an nominal fee of twenty sen a month. The Legation contributes 1,200 yen annually, and Chinese officials passing through are entered in the Benefactors' list for varying sums. All provinces have their subsidiary organizations, which hold frequent meetings to consider questions of interest. They elect their own leaders who represent them in the Club councils. Besides a library, well stocked with books of reference, there are reading, dining, and reception rooms, open daily from seven in the morning till ten at night.

The students are well organized, and take good care of their countrymen. Their agents in Tientsin and Shanghai are always ready to look after men who have just arrived from the interior, to help buy their tickets and to furnish information regarding their voyage. From these points the travellers are sent with letters of introduction to other agencies in Nagasaki or Kobe, then by train and steamer to Tokyo, where the Club takes charge of them until they are safely lodged and established in their new surroundings.

In recent years the idea of China for the Chinese has been definitely taking shape. The students in Japan are imbued with the new spirit, and in the past year or two the number of men who are prepared actively to voice their ideas has vastly increased. So far, there have been 411 graduates from Japanese institutions, 142 have studied in the military schools, 184 have made themselves ready to teach their countrymen. Their sentiments are expressed in their publications, most of which are issued *sub rosa*. Four magazines, printed in Tokyo, are circulated throughout China. Provincial journals, published by students from Chekiang, Hunan, Hupeh, and Kiangsu, stand for as many different means to the same end. The Hunanese are the most rabid and unreasoning in their denunciation of the Mantchus. The Chinese, they say, are worse than the Indians, for they recognize only the English as their masters, while the Chinese bow down before the Mantchus, who, in turn, are helpless in the hands of the foreigners. Hupeh and Chekiang are working upon more or less similar lines. They desire a Council, a Parliament to regulate expenditure and to check official corruption. They talk of public opinion, and claim that the people only need representation to work out their salvation and bring the nation to the fulfilment of its destiny. Kiangsu, on the other hand, blames this same "people," and preaches education as their one hope. Liang Chi Chao, an exile, at his desk in Yokohama, writes stinging editorials against the Mantchus in the pages of the *New People's Review*, while Kang Yu Wei, another patriot with a price on his head, leads the "Pao Hung Hui," a society whose object it is to support the Emperor against the Dowager.

All political discussions are forbidden in the Middle Kingdom, except in Shanghai, where the Chinese authorities have found it impossible to bridle the native press. The revolutionary pamphlets, however, have been spread broadcast by newsdealers, usually Japanese, who have opened shops, and, presuming on extra-territorial rights, sell their wares in defiance of the local officials. Everywhere in China newspapers are being more widely read. The people are beginning to understand. Those who cannot read hear the news bandied about in the tea houses, for the Chinaman is a great talker, and, in a land where rumor is eagerly credited, fact must find a ready welcome. The Chinaman is primarily a practical person. He is a business man, and if it can be brought home to him that the adoption of certain measures will bring prosperity, if he can be made to realize that any partition of China would be prejudicial to his own interests, he will be the last man to stand idly by and see the bread taken from his mouth.

It is well known that Chinamen flourish nowhere as they do under an alien flag, safe from the rapacity of their own officials. This the student will grant you, and tell you that his first duty will be to become an official himself, and insure his countrymen at home the same freedom they enjoy abroad. It is a mistake to say, as many

*Four journalists were arrested in the Shanghai Foreign Settlement for printing seditious articles. The Municipal Council refused to turn them over to the Chinese authorities. The matter was finally referred to Peking.

have said, that the Chinaman is not patriotic. His sense of responsibility has, possibly, been undeveloped, but he has a good foundation upon which to build. No man is more ardently attached to his village and his family than he; it would be a step, and not a difficult one, that would raise his local pride to the dignity of national sentiment. The whole body politic is loosely bound by an elaborate network of village and district ties. China is an association of provinces rather than a united empire. It is the student's ambition to make the aggregation a unit.

The men who return from Tokyo will have greater influence with their countrymen than those who have been educated in the West. During their school days they have lived more after the fashion of their own land. They have constantly associated with their nationals, discussing with them their home problems in the broader light of the new learning, the mastery of which is their day's work. Instead of being lost in the midst of a civilization entirely different, and influenced by a race wholly alien, they are in constant touch with a life which is a development of their own, remodelled and modernized. The student desirous of inaugurating reforms at home has constantly before him, as an example, the realization of the very schemes he cherishes as his own ideal. The saner and older men among the students know full well the material with which, and upon which, they must work, and the sentiments to which they must appeal. They do not cry for the expulsion of the Mantchus, unless it be found that the present dynasty is unfitted for its responsibilities. The Mantchu and the Chinaman, they say, are practically the same; the former has been absorbed by the latter people. They do not demand a Parliament, although three of the great Viceroys, Yuan Shih Kai of Chihli, the Metropolitan Province; Chan Chih Tung of Hankow, and Chou Fu of Nanking, have memoralized the Throne concerning the establishment of a constitutional government. They know that the time is not yet ripe, that recognition of the rights of the individual is not as essential to the happiness of the Asiatic as it is to the Anglo-Saxon. The great mass of the people are content to till their fields and let politics take care of itself if they be left to their own devices and not troubled by official interference. The latter-day idea is rather to build railroads, not as heretofore with foreign, but with Chinese capital. There must be a common tongue, the Pekingese must be able to converse with the man from Amoy or Fuchau in words, and not by written characters alone.

The students hope to make the people realize that they are part of a great nation, not merely members of the thousands of cities and small communities throughout the Empire. When China understands that what affects the north must also affect the south, that commercial disorder in one province must have a ruinous effect in another, that the peril of one is the peril of all, then will she present a solid front to the world. The Chinaman must be educated. He must be convinced that official corruption and the lack of united effort will be fatal not only to his neighbor, but to himself. His patriotism must, in the beginning, be prompted by self-interest. China is waking. The change will be gradual. The students from Tokyo will be the leaders in the Renaissance, and it is for that purpose they are training themselves to-day in the schoolrooms of Japan.

WILLARD STRAIGHT.

THE PROVINCE OF THE MEZZOTINT.

LONDON, August 15, 1905.

Your readers may not be displeased if I supplement what I may call the social-historical review of Mr. Sidney Colvin's exhibition of mezzotints at the British Museum, in your issue of the third instant, with some technical observations on the same remarkable show. Mr. Colvin says, in his preface to the catalogue, that he displays less than a twentieth, probably less than a thirtieth, of the mezzotints in the Museum. But there are quite enough for every purpose, and they have been selected so as to give a representative historical series of the best prints in their best states from Von Siegen and Prince Rupert, about the middle of the seventeenth century, down to the engravers who reproduced Hoppner and Lawrence and Beechey in the first part of the nineteenth century.

The result of a study, under these auspices, of mezzotint engraving as practised in the days supposed to be its greatest, is the conviction that never has an art suffered more from its admirers and patrons. Mezzotint has some very beautiful qualities, and is full of delightful possibilities for the artist who understands it. There is no method of engraving that yields such rich blacks, such depth and color, such variety in texture; none, one would think, that lent itself so well to the reproductions of paintings. But it has the defects of its qualities, and probably there is no method of engraving that can be so easily abused, that abounds in so many pitfalls of mere prettiness and meretriciousness. One of the extraordinary things about it is that, technically, its inventor (or rather the pupil of its inventor) left so little chance of improvement or development. There is not a mezzotint shown finer than that famous copy of Spagnoletto's "Executioner," by Prince Rupert. It revealed at once all that can be got out of a plate when the engraver works on it in what the French appropriately call *la manière noire*. And it revealed more than this—or would have revealed more had Prince Rupert's followers had eyes to see—for it showed the value of restraint. The men who reproduced Reynolds and Romney only too often threw restraint to the winds, and sought, above all, the much-vaunted "velvety black" that delighted their fashionable friends but becomes cloying in the end. The blacks in Prince Rupert's print have far more virility and vigor, far more variety of gradation, far more truth of tone.

It is no less curious that the mezzotinters who came immediately after Prince Rupert should have made the mistake of over-dryness in their plates. In comparison with that splendid "Executioner," the prints of Blooteling and Vaillant, of Francis Place and George White—with occasional exceptions, more particularly by Blooteling and Place—have a tendency to hardness and colorlessness. These engravers seem either not to have known what they could do with mezzotint, or else, knowing, to have been afraid to do it. It is the more inexplicable because the later generation of mezzotinters, when the art had been popularized, went to the other extreme of softness and exaggerated color, even the very best of them. To go through the numerous prints by McArdell, and Dickinson, and Valentine Green, and John Raphael Smith, and the Wards, and the Watsons, and the others, is to be satiated by their sweetness, to weary of their conventional charm. What is apt to be forgotten, since the modern collector has made the old mezzotint the rival of the Japanese print and the postage stamp, is that all these men worked almost exclusively for fashionable patronage, and rarely, like the original engraver, primarily for their own amusement. People went to the mezzotint engraver as they went afterwards to the photographer; what they wanted from him was what they get more to their fancy from the camera and the faker of photographs—I mean the "artist-photographer." The mezzotinter could not serve his clients so satisfactorily, for the simple reason that his business was not to make portraits from life, but to reproduce them from paintings—usually from the work of the most distinguished painters of the period. However, he did his utmost, and it must be confessed, if we are honest, that the distinguished painters often played into their hands. Reynolds and Romney and their school were not always above adapting their work to their sitters' taste; and, besides, the traditions of Van Dyck, by the time they reached the English portrait-painters of the eighteenth century by way of Lely and Kneller, tended to artificial elegance and a tiresome decorative formula; and, in the fashionable mezzotint, elegance and decoration were intensified a hundredfold. Nothing was spared in the affectation or languishing of a pose: draperies swirled with a more abandoned grace, ribands flew out at more tender angles, and, in the background, foliage became more feathery, clouds more an affair of curves and pattern.

All these things were rendered and exaggerated with the greatest skill, for the mezzotinters of the day were masters of their craft. That they were often artists, too, is proved in plates where the fashionable demands upon them were less stringent, where grace and decorative prettiness were at a discount. I do not think any one can go to the British Museum, look dispassionately at the collection there, and then deny that the masterpieces of mezzotint are found, not among the portraits of women now fetching sensational prices in the salesrooms, but among the portraits of men now to be had for a comparative song. In these you feel that the engravers were doing the work they cared for in the way that pleased them most. McArdell's "Lords John and Bernard Stuart," after Van Dyck; Edward Fisher's "Laurence Sterne," after Reynolds; James Watson's "Samuel Johnson," Thomas Watson's "David Garrick," John Raphael Smith's "Lord Richard Cavendish," Dickinson's "Duke of Rutland," all after Reynolds; and, to me one of the most successful, Valentine Green's beautiful interpretation of Reynolds's portrait of himself, so dignified and simple in treatment, so true in tone, such subtle gradation in the grays and

blacks—these are the prints that arrest you as you pass, the prints that are the great glory of the art.

Altogether, the exhibition must fill the real lover of mezzotint with regret that so fine a method should have been at the mercy of fashion, both in its prime, when fashion ordered the prints, and to-day, when fashion collects them. Prince Rupert, in his "Executioner," the famous Englishmen in their portraits of men, have demonstrated beyond a doubt what the method can do in the rendering of figures; what it can do in the suggestion of landscape may be seen—not in the exhibition, where there are only two or three landscapes—but in the all too few examples by Turner for his 'Liber Studiorum,' and in the simpler plates by Lucas after Constable. I cannot help wishing that Mr. Colvin, while omitting, as he has rightly, the inferior work of most of the men who carried on the tradition in the nineteenth century, had given a place to these mezzotints by Turner and Lucas, for I know of none that explain better how admirably adapted the medium is to landscape, how entirely it reserves its finest effects for subjects that can be expressed in large, simple masses and broad outlines, without tedious detail and niggling. Here, really, is its province, though one in which it has been least developed. It is when you consider the great achievements of which the art is capable, the great things it has accomplished, in the translation into black-and-white of good portraits of men by distinguished painters; when you remember the chance it offers to the original artist who has fought so shy of it, that you resent the money inflicted on it by fashion—first, by tempting the engravers during their lifetime with a sure and easy means of making a livelihood, and then by giving predominance to their least important, their least vigorous work (that is, artistically) through a passing fad of the collector. When all is said, however, it is only fair to admit that the popular portraits of women in mezzotint, by the eighteenth-century school of engravers after the eighteenth-century portrait painters, are far better worth collecting than the feeble and foolish color prints that are no less the fad of the moment. N. N.

Correspondence.

THE PHILIPPINES AND THE BOYCOTT.

To the Editor of The Nation:

Sir: What is the matter with the Imperialists? From 1898 until recently they have proclaimed in unmeasured terms the value of the Philippines as "a strategic point commanding the trade with the Orient," etc., etc. Many Americans were deluded into accepting the grievous and shameful burden of the Philippines in view of its prizing open the door of China's markets to their commerce. Let them now contrast the promise with the fulfilment, perceive and admit that the Imperialistic fiction was a hollow pretence to cover a sordid land-grabbing scheme; that the possession of that wretched archipelago has no bearing whatever on American trade with China; that when a Chinaman declines to buy from them, fleets and strategic points are alike impotent; that trade depends so largely on mutual good will that it is folly to kick a possible purchaser and then expect him to buy a bill of goods.

The Chinese reply to the Imperialistic contention is simply a boycott. So, Messieurs les Impérialistes, marry, come up—what are you going to do about it? Your answer is impatiently awaited by

An Anti-Imperialist.

Boston, August 29, 1905.

DOVE AND DIVED.

To the Editor of The Nation:

Sir: In your issue of the 17th inst., I find on page 139 this sentence: "It is not generally known that the American submarine *Porpoise* dove [*sic*] 120 feet, etc."

I have subscribed to your valuable paper for many years, and have been, during that time, an attentive reader of it. I therefore dislike to criticise anything therein contained. It, however, seems to me that "dived" is the correct word to use—not "dove." Critic.

Eaglesmere, Pa., August 20, 1905.

[In Edward FitzGerald's translation from Calderon, "Such Stuff as Dreams are Made of," first act and scene, "Critic" may read this figure of the setting sun. The lines are from the mouth of *Rosaura's* attendant, *Fife:*

"Ah, he's himself past catching; as you spoke
He heard what you were saying, and—just so—
Like some scared water-bird,
As we say in my country, *dôve* below."

FitzGerald's "country" was, of course, Suffolk. Dr. Murray, in the Oxford Dictionary, under *Dive*, enumerates *dove* among the various forms of the preterite, with the simple label, "U. S. and Eng. dial.," to which he adds: "The modern dialectic past tense *dove* is apparently a new formation after *drive, drove*, or *weave, wove*." His earliest literary quotation is from Hayes's 'Open Polar Sea,' 1867. We think our correspondent is needlessly skittish of the form either as dialect or as an Americanism.—Ed. Nation.]

LOAN AND LEND.

To the Editor of The Nation:

Sir: In a belated copy of the *Nation* I find, on page 133, the phrase, apropos of a German loan to the Sultan of Morocco: "To loan money to him is practically to loan money to Morocco." I am writing remote from dictionaries, but is it really justifiable to use "loan" as a verb? The usage is common in the United States and Canada in commercial circles, but much less so, I believe, in England.—Yours truly,

George M. Wrong.

Pointe au Pic, Murray Bay, Quebec, August 25, 1905.

[Any noun may be used as a verb, but not all such applications will find favor. Dr. Murray gives a chapter to the verb loan, remarking "Now chiefly U. S." There are equivocal examples of its use as far back as 1300; the first assured occurs in an act of Henry VIII. Bonamy Price did not stick at the word in 1880. —Ed. Nation.]

Notes.

Among the fall announcements of Macmillan Co. are 'New Creation in Plant Life,' an account of Luther Burbank and his work, by W. S. Harwood; the 'Recollections' of William O'Brien; 'Life of Oliver Ellsworth,' by William Garrott Brown; 'Napoleon and his Times,' in the Cambridge Modern History; 'Pre-Raphaelitism and the Pre-Raphaelite Brotherhood,' by W. Holman-Hunt; 'The History of American Painting,' by Samuel Isham; 'India,' by Flora Annie Steel, with colored illustrations by Mortimer Menpes; 'Persia, Past and Present,' by A. V. Williams Jackson; 'A Wanderer in Holland,' by E. V. Lucas; 'In the Heart of the Canadian Rockies,' by James Outram; 'Sporting Sketches,' by Edwyn Sandys; 'The Far East and the Great War,' by B. L. Putnam Weale; 'Venice,' by F. Marion Crawford, illustrated by Joseph Pennell; the second volume of the enlarged edition of Grove's 'Dictionary of Music'; a 'History of Education,' by Prof. Paul Monroe; 'A History of Political Theories, from Luther to Montesquieu,' by Prof. William A. Dunning; and 'Nero,' by Stephen Phillips.

From A. C. McClurg & Co.'s fall list we select 'With Shelley in Italy,' by Anna Benneson McMahan; 'Remenyi: Musician and Man—An Appreciation,' by Gwendolyn Kelley and George P. Upton; 'Arts and Crafts of Old Japan,' by Stewart Dick; 'Far Eastern Impressions,' by Ernest F. G. Hatch; 'Home Life in France,' by Matilda Betham-Edwards; and 'In the Land of the Strenuous Life,' from the French of the Abbé Félix Klein.

B. W. Huebsch, New York, announces 'Christian Origins,' translated by Dr. D. A. Huebsch from the German of Otto Pfleiderer; and 'Beethoven' and 'Mozart,' as revealed in their own words as man and artist, respectively, from the German of Friedrich Kerst by H. E. Krehbiel.

'Perdita, and Other Poems,' by Charles J. Bayne, will shortly be published by the Cole Book Co., of Atlanta, Ga.

The eminent Swedish philologist, Prof. Adolf Noreen of Upsala, author of standard Old-Norse-Icelandic and Old-Swedish grammars, is now publishing his great Grammar of Modern Swedish, through Gleerup (Lund). This vast undertaking is designed to be comprised in four parts, filling nine volumes of 500-600 pages each, so that the whole work will contain something like 5,000 pages. The first part consists of a general introduction; the second deals with phonology, the third with semasiology; the fourth, besides including morphology, will provide a detailed index to the whole work. Those who are familiar with the scientific methods followed by Professor Noreen in his earlier publications know what to expect from the rare combination of scholarship, imagination, and critical acumen, of phonetic training and philogical learning, which have rendered this author one of the greatest living authorities in the field of Scandinavian languages. The completion of the work will be eagerly awaited.

We have received two dozen volumes of

the reissue, after eight or ten years, of Routledge's "The Muses' Library," with the American imprint of Dutton. In their size, 16mo, and rather small print, they make a popular appeal, but Dr. Richard Garnett, W. B. Yeats, G. A. Aitken, Alfred Pollard, and other authoritative writers have been called in as editors. The poets whose works are included in this collection range from Adelaide Anne Procter and Coventry Patmore to Keats, Blake, Coleridge, Goldsmith, Gray, Herrick, Donne, etc., etc. The volumes are annotated at the end.

Although an apology for Napoleon, Henri Houssaye's '1815: Waterloo,' is recognized abroad as a brilliant and valuable book. The translation by S. R. Willis (Kansas City: Franklin Hudson Co.) hardly does justice to the style of the original. but will serve to convey its meaning, and for that reason is welcome.

'Maria Sophia, Queen of Naples,' translated from the Norwegian of Clara Tschudi by Ethel Harriet Hearn (E. P. Dutton), is rather too slight in substance to make a book of. Maria Sophia was queen for only two years, and although during that short time much happened, including Garibaldi's expedition, she played but a modest part in it. Still, Miss Tschudi succeeds in rousing an admiration for her heroine's fine qualities, and our sympathy for her personal sorrows. Maria Sophia, who still lives, comes of that Wittelsbach family on which a curse hangs like that which blasted Pelops's line. Louis II. of Bavaria went mad and drowned himself; her youngest sister, the Duchess d'Alençon, was burned to death at the Charity Bazaar in Paris; her second sister, Elizabeth, Empress of Austria, was assassinated in Geneva.

"A Digit of the Moon, and Other Love Stories from the Hindoo," translated from the Original Manuscripts by F. W. Bain (Putnams), bears date 1905, but there is no explanation in it of the puzzling fact that it contains a preface to the first edition of 1898, without itself being called a second edition. Nor does it appear whether the present edition is original or pirated. At least one of the four stories appeared separately in London, two years ago. As for the "Stories from the Hindoo," though palpably a pretence, they are graceful fancies, and might as well have appeared for what they really are instead of masquerading as "translations." No Hindu, unless of this generation and under foreign influence, ever conceived these stories. They are an amalgam of delicate European thought and flowery Hindu expression. The native atmosphere has been rather cleverly caught, and the author has adopted several Hindu tricks of story-telling. His acquaintance with Hindu literature appears to be limited to a few often translated classics; but he gets the local Indian color and has a well imitated (though considerably chastened) Hindu style. Many persons will deem his stories charming. At any rate, they are touchingly sentimental and written in extra-florid English. Moreover, they are of a strict propriety, whereas original Hindu love stories would put Rabelais's ghost to the blush. One so well versed in Sanskrit as is the author should in future editions correct the spelling of *usriyáyam* (p. 137) and *purushárta* (p. 174).

The "in my garden" sort of book is losing its novelty. Even India has produced two or three. The last, if we remember correctly, was from Kashmir. Now comes one from Lucknow, 'My Garden in the City of Gardens: A Memory, with Illustrations' (John Lane). The author's name is discreetly suppressed. The chapters are headed with the names of the months from October to June, when the *Mem Sahib* deserts her garden and flees to the hills. There is less garden than quotation—mainly Latin, French, and early English—and the chief impression produced by the book is that in India the Englishwoman wishes she were back in England. Reminiscences of the Mutiny abound, a well-authenticated ghost story is given in detail, and *dengue* fever is derived from "Aden-ague"! As garden-books go, this one is sufficiently entertaining, and the descriptions are as good as the photographs.

'Sanctuaires et Paysages d'Asie,' by André Chevrillon (Paris: Hachette), is a book of impressions. The author voyages in Ceylon, India, and Burma, and brings before the reader each scene as he sees it, in a series of sentences more or less denuded of verbs, and closing with exclamations. The publishers kindly furnish the reviewer not only with the book but with a ready-made review pointing out its excellences. To one not conversant with Eastern thought it may be said that the impressions here reproduced are sufficiently real, and reflect what one must necessarily experience in seeing the strange life of Benares and the Buddhism of Burma. The Orientalist will not discover any great originality either of thought or description. Here is an example from the chapter entitled "La Mort à Bénarès": "Oui, étrange, cette humanité, étrange sa vie, au point de présenter, plus pressant, plus accablant que d'habitude, le mystère de toute vie . . . Cette vie, je ne puis la concevoir directement; . . . simplement, c'est une forme que j'ignorais, une des innombrables formes de l'éternelle vie. . . . Petites ruelles de Bénarès, quelles ardeurs circulaient et nous partaient à travers leur fiévreux labyrinthe!" etc., 361 pages.

Records of personal intercourse with Goethe during the different periods of his life furnish some of the most attractive and valuable contributions to his biography. Following Falk and Eckermann at a long interval we had, in 1869, Friedrich von Müller's 'Unterhaltungen mit Goethe,' edited by Dr. Burkhardt, director of the Grand Ducal Archives in Weimar, from the author's diary, and issued twenty years after his death. To Dr. Burkhardt we are now indebted for 'Goethe's Unterhaltungen mit Friedrich Soret,' also derived from a diary written in French and preserved in the Weimar archives. Soret was born in 1795 in St. Petersburg, where his father, a native of Geneva, had the position of court-painter, but from his fifth year he was reared and educated in Geneva and Paris. He began the study of theology, but soon abandoned it for natural science, in which he acquired distinction, especially as a crystallographer. In 1822 he came to Weimar as tutor of the heir to the throne, Karl Alexander, then only four years old. The discharge of this duty brought him into intimate association with Goethe, who soon learned to hold him in high esteem, and often entertained him as a welcome guest. In their frequent conversations the venerable poet expressed his views with remarkable freedom, and thus revealed some new and striking features of his character, which in no other works of this kind are so distinctly and impartially portrayed. One curious revelation was Goethe's superstitious fear of March 22; he always felt anxious as this day approached, and greatly relieved when it was past. It was on March 22 that he died. In the decline of his bodily vigor this dread may have naturally determined the date of his death. It is the intention of Dr. Burkhardt to publish Soret's diary in the original French.

The eighth volume of Publications of the Buffalo Historical Society might be said to consist of several books. Orrin Edward Tiffany treats extensively (pp. 1-152) the Relations of the United States to the Canadian Rebellion of 1837-8; supplementing the narrative with many inedited documents and numerous facsimiles of placards illustrating that heated time on the border. Robert B. Adam's History of the Abolition of Railroad Grade Crossings in Buffalo, a half-century task, occupies a hundred pages more, and can but be valuable for consultation by other municipalities vexed by the same problem. The Dobbins Papers, relating to Daniel Dobbins, a Lake pilot, demand 120 pages. Passing over other titles, we will mention the closing reminiscences of Buffalo Social Life in the Thirties, by Martha Fitch Poole, which are light and pleasant reading. The War of 1812, it need not be said, figures prominently in this bulky volume.

Liberia is apparently entering upon an era of prosperity and development, judging from the account of the negro republic by Sir Harry Johnston in the *Geographical Journal* for August. Though by far the larger part is still dense forest, penetrated only by narrow native paths, or more often only elephant tracks, he found last year that in many places the coast land which, at his first visit in 1882, was heavily wooded, had been cleared for plantations and towns. He noted a decided improvement in the physique of the Americo-Liberians, due partly to intermarriage with women of the vigorous indigenous races. Up to within ten years there have been constant struggles between these foreigners, who number some twelve or fifteen thousand, and their native subjects, who are about two million strong—a curious result of which is "that the white man in Liberia is received everywhere with great friendliness, because he is not associated in the minds of the natives with anything like conquest or oppression." Recently there has been a marked advance in good relations between the American settlers and the natives, which has been greatly promoted by the wise policy of President Barclay. The Government, in conjunction with two British companies, is seriously endeavoring to develop the resources of the vast forest which, in its wealth of rubber-bearing trees, plants, and vines (twenty-two different species having been discovered), is without parallel in any other part of Africa, except it may be in one or two small areas in the Congo Basin. The foreign quarter of Monrovia, the capital, has broad streets, substantial, well-built, comely looking houses, churches, offices, and public buildings. The attractiveness of the houses is greatly increased by the beautiful clumps of trees and the gardens filled with flowers which

surround them. While many signs of progress are to be seen in the settlements of Grand Basá, the most progressive and energetic Americo-Liberians are to be found at Harper (Cape Palmas), where there is a philosophical society which is doing a good work in collecting and printing statistics about the country. It is a singular fact that there is a remarkable absence of mosquitoes and to a certain extent of malarial fevers in Liberia, though its swamps would seem to be an ideal home for them.

The address delivered several months ago by Lord Rosebery at the banquet of the English book-dealers in Edinburgh, in which he declared that the uncritical acceptance of manuscripts and untruthful announcements of new books by publishers were largely responsible for the increasing overproduction in the book trade of England, has furnished leading German periodicals with a welcome text for a lecture on the ethics of publication to the book trade of that "country of authors and thinkers." For instance, Dr. Oskar Bulle, in the *Beilage* of the Munich *Allgemeine Zeitung*, No. 149, applauds the position taken by Lord Rosebery. He pronounces the prime cause for the phenomenal literary overproduction in Germany—where the annual output is equal to that of England, France, and America combined—to be the "Schreibewut," or writing mania, of the Germans themselves. Only about a year ago the Strassburg publisher, Trübner, declared it to be his deliberate conviction that only one out of every ten book manuscripts offered by German authors gets published. A second chief cause, according to Dr. Bulle, is the conscienceless way in which book publishers in Germany announce and advertise their publications, with small regard to truth and fact. Especially does he criticise the utterly false announcements that generally accompany the copies sent to the press for review, and for which the Germans have the rather undignified but characteristic name of "Waschzettel," or laundry list.

Complementary to our Korean correspondence on another page, we find in the *Chinese Recorder* for July a noteworthy paper on "Japanese Educational Influence in China," by Tasuké Harada of Kobé, Japan, delegate to the recent educational convention in China. Until a score of years ago, every Japanese looked up to China as his superior and teacher; Chinese classics being regarded as the source of wisdom, and China, except in the matter of science and mechanics, equal to Europe. Even nineteenth-century Japanese sages believed that the Utopia for Japan was a state of society in which the ethics of Confucius and the mechanical arts of the Occident were harmonized. Until the war of 1894-95, China was a great mysterious power, but the victory of Japan exactly reversed the positions of the two nations of the Far East. Now a new era in the liberation and enlightenment of modern China has been entered upon. "A child on a man's shoulder, as he crosses a river, points out to him the shallows," runs the proverb of Nippon. To-day, Japan influences China educationally through Japanese teachers in China, Chinese students in Japan, and Japanese literature translated into Chinese. Near Shanghai there is a school for training Japanese young men in Chinese. It has 320 students and 150 graduates, who are now scattered all over China, there being now fifteen full professors in the Chinese Government colleges, besides 159 Japanese subjects in other educational institutions in China. They receive from four to six times the amount of salary possible at home. Chinese lads and maidens, to the number of 2,399, are studying in thirty-seven schools in or near Tokyo, the preference being, in their order, for the military, naval, legal, and medical sciences, music and art. These students represent every one of the eighteen provinces; Hupeh, Hunan, and Szechuen having each more than 300. The statistics, good for February 1, 1905, might now probably be increased one-third. Most remarkable is the enormous number of Japanese books, from primary-school text-books to voluminous works on science, history, and philosophy, which have been put into Chinese. One publishing house in China has a list of 608 titles, divided into fourteen sections, and covering almost every branch of human knowledge. Japanese in China publish books and magazines, and "a vast number of young Chinese men and some women" read books and papers in the Japanese language. Many Chinese students in Japan return home without fully completing their studies, and lose also somewhat of their good manners and economic training, yet, like Chinese generally, when away from home they are the more susceptible to beneficial change.

The tenth biennial session of the International Statistical Institute was held in London during the first week in August, members from nineteen different countries, including Japan, being present. There were from the United States John Hyde and Professor Willcox of Cornell, Government delegates; Dr. J. S. Billings and Edward Atkinson. France was most largely represented, and the official language was French. In his opening speech as honorary president, the Prince of Wales called attention to the fact that his grandfather, Prince Albert, held a similar position at the international statistical congress in London in 1860. Among the subjects discussed were occupational censuses, the statistics of unemployment, of workmen's wages, and the economic balance of nations. M. Yves Guyot contributed a paper on the incidence of customs duties, in which he said that his figures led him to the conclusion that only 3 per cent. of the total occupied population derive any benefit from protection in France, and that, with the exception of cotton and flax spinners and a certain number of metal workers, all other industrials would profit by free trade.

In Chili there has been within the last few years an extraordinary growth of industrial life, stimulated largely by the high prices ruling in Europe for three of her staple products—nitrate, wool, and copper. In consequence of this increase, national capital is rapidly supplanting foreign. In Tierra del Fuego and Magellan, for instance, there has been a remarkable boom in sheep farms, and land which was largely held by British sheep farmers on lease or yearly tenancy has been bought by large Chilian companies, which in many cases employ British managers. Very high prices have been paid, one British-owned farm bringing a million dollars, and this in a region which till recently was almost unknown.

The Academy of Sciences in Vienna, if not the first to appreciate the value of the phonograph for scientific purposes, has made as yet the most systematic and successful use of this instrument for the promotion of scholarly research, especially in the province of comparative philology. "The Phonographic Museum," founded by this learned society, contains an exceedingly interesting and constantly increasing collection of phonograms, not only of the utterances of distinguished personages, but also of languages and dialects spoken in different European countries and in many other lands. Expeditions are sent every year to remote parts of the world, in order to phonograph the voices, tones, and manner of speaking peculiar to different peoples, so that they may be heard long after these races have become extinct. Dr. Poech is now in Australia recording the speech of the native tribes. These investigations are not confined to mankind, but include also the lower animals, thus enabling zoölogists to study the sounds, vibrations, and undulations in the voices of various species. Such phonograms ought to facilitate the study of animal speech, to which Professor Garner has devoted himself with laudable zeal, if not with remarkable success.

—To the recovery of the body of John Paul Jones and consignment to its appropriate resting-place, we owe the stanzas contributed to the September *Century* in honor of the occasion by Edmund Clarence Stedman. A reproduction of the copperplate engraving of Jones by Moreau, together with the Peale portrait and two views of the Houdon bust, will justify to most readers, we think, the claim that the Moreau representation is far superior to that of Peale. The reproduction is from the print picked up in an old shop by the late B. F. Stevens, about twenty years ago, and later presented by him to the Bostonian Society. Christian Brinton presents, with appropriate comment, a number of illustrations from the plans of Messrs. Carrère & Hastings for the improvement of the national Capitol; and from the same pen we have a few highly appreciative paragraphs concerning the new church edifice of Dr. Parkhurst's congregation, on Madison Avenue and Twenty-fourth Street. The architects, Messrs. McKim, Mead & White, have succeeded admirably, Mr. Brinton thinks, in overcoming the difficulties of the site, with its fifteen-story sky-scraper at the back, its 600-foot tower opposite, and its possibility of additional neighbors of the same type in the future. A color drawing, by Jules Crow, accompanies the brief description. Margaret E. Noble contributes a very timely and convincing paper on "Ole Bull as a Patriotic Force," but doubtless some disciple of the later ideas in political development will step in to inform us that the forces underlying the present Norwegian upheaval are at bottom purely economic. In his stories of the Far Northwest, the fourth of which appears in the present issue, Lawrence Mott is serving up in bits a character which would have made admirable material for a sustained piece of fiction. The short-story habit is doing a real harm to literature when it breaks in pieces so lifelike a creation as Jules Verbaux.

—Volume viii. of the Publications of the Mississippi Historical Society (Oxford) testifies to the laudable activity of this body. The civil war, in one form or another, continues to occupy the minds and the pens of most of the contributors, though the Indians receive an unusual degree of attention, and there is a timely exposition of the dispute over their Gulf boundary between Mississippi and Louisiana, now divided elsewhere by shotgun boundaries in consequence of yellow fever. Another novelty (for us) is an "index to campaigns, battles, and skirmishes in Mississippi from 1861 to 1865"—a gazetteer of conflicts, petty and major. This has been drawn from the Official Records, by Stephen D. Lee. In connection with an account of Confederate cemeteries in the same State, by Prof. R. W. Jones, there are lists of their respective dead. Quite the most significant paper is that by Col. J. H. Jones, "Reconstruction in Wilkinson County." We cannot forbear to quote a passage or two:

"It must be confessed that the Mississippi Legislature of 1865 and 1866, assembled under President Johnson's plan of reconstruction, afforded good reasons for belief in the minds of the ignorant negroes that their old masters were secretly conspiring against their newly acquired freedom, and only waited for an opportunity to put their plans into effect. Looking back upon the methods by which that Legislature undertook to deal with the negro problem, one is amazed at such stupidity, at such a display of monumental folly committed by men of ordinary intelligence. . . . They began to amend the slave code by conferring 'additional rights on freedmen, free negroes, and mulattoes.' Among the 'additional rights' conferred was the privilege of marrying in the same manner as white persons. That is, they were graciously permitted to live in holy matrimony, after God's own ordinance, and were no longer to be compelled to disregard the marriage relation and live in legal adultery as required under the slave code. . . . Are we free from responsibility for the almost total indifference to the obligations of marriage which characterizes the negroes today?" (p. 155).

—This is refreshingly plain-spoken for a Southerner addressing Southerners. Mr. Jones goes further, and confronts Northern apologists who inveigh against the bestowal of suffrage on the negroes, by declaring (p. 158): "When I read these laws of our Legislature of 1865 and 1866, presumably enacted by the best intelligence of the State, I was not at all surprised that bitter Abolitionists like Thad Stevens, himself a miscegenationist, should have believed that the Reconstruction acts were necessary to the proper administration of justice in the South." A writer capable of such candor can still betray in himself the root of the evil of all injustice at the South. Says Mr. Jones (p. 163): "The men of Wilkinson County were high-spirited, and were never so depressed as to submit to personal insults from any one, and especially from negroes. They were soon made to understand that while they could drum and fife and parade and vote the radical ticket, and make fools of themselves generally, insolence to a white man would provoke a bullet in return." Does Mr. Jones here speak detachedly, simply as historian?

—The third volume of the Heath Papers, printed by the Massachusetts Historical Society, is full of good historical material. The greatest surprise lies in the quality of Heath's own letters. They leave a distinctly better impression of the man than can be derived from his stilted memoir. Whether in command at West Point, with the French at Rhode Island, or on leave, he was careful in his duties, considerate in his relations to State and Allies, and capable of a mastery of details united to a certain breadth of judgment that made him useful in holding together a somewhat disorganized body of troops. The post at West Point was of the highest importance, commanding, as it did, the communications with New England, and good management was needed to maintain it with troops badly fed, paid, and clothed. For this task Heath was admirably equipped, and his tact gave rise to an impression of a certain want of decision. He was himself sensitive as to recognition, and his feelings were hurt by an apparent preference given to a foreigner. His mission to the Eastern States demanded decision and exactitude, and what he obtained undoubtedly aided the success of the Yorktown venture. He showed consideration to his associates and subordinates, and smoothed over many difficulties which might have led to serious mutinies. It is creditable to his command that it was ready to march against the mutineering regiments of Pennsylvania and New Jersey. Only when the new ration contracts of 1782 had failed was there an outbreak.

—A large number of interesting subjects might be noted from this volume. The letters from Lafayette describing the etiquette to be followed with the newly arrived French forces is entirely characteristic, and lays down principles sound in themselves, but difficult to pursue with ragged regulars and untrained militia. Heath made a very diplomatic reply; but in truth no forms were required, and the Allies grew to respect one another in spite of the great disadvantages under which the Americans labored. Many details of the French stay in Rhode Island are given, as well as the proposed attack on Halifax, the operations in northern New York, and the descents on Long Island. Some letters from "S. G." add to what is known of the secret service, so efficient under Tallmadge, and that officer describes the death of André. Complaint is often raised against the poor quality of the recruits, old men, negroes, and boys, but mention is made of Col. Greene's "very small" regiment of blacks, which was divided when united to the main army, "so as to abolish the name and appearance of a black corps." The militia comes in for a share of condemnation, and even their lack of spirit in throwing up fortifications attracted attention. This volume probably closes the Heath series, as the last letter is dated 1797. The editor, Charles Card Smith, shows his usual judgment and sound selection, and the notes are few but suggestive. A reference to the Washington Papers would have supplied some matter omitted because of torn sheets; and the appearance, without explanation, of a letter of 1777 (p. 153), among the letters of 1781, leaves a curious impression.

—In his 'Studies on Anglo-Saxon Institutions' (Macmillan), Mr. H. Munro Chadwick of Clare College, Cambridge, marshals the evidence regarding a great many obscure and difficult points in the early history of England. Almost all writers on constitutional subjects have, when dealing with the Heptarchic period, taken over from the laws, the chronicles, and the general literature of the time a large number of special terms and employed them in their own writings without attempting to define the exact significance of each. The result is that few save professional students have any real grasp of Anglo-Saxon terminology, even where it affects the foundations of our historical knowledge. It is the aim of Mr. Chadwick in this book to preface all discussion of larger political, social, and economic themes by such an account of technical words as will reveal their meaning at different epochs. Take, for example, the term "shilling," one of the commonest units in the monetary system. Prior to the eighth century it may have been a coin, but from this period forward, for a considerable time, it was simply a unit of account, and by no means an invariable unit at that. Mr. Chadwick's conclusions, which are partly the result of coördination and partly the fruit of original research, affect the fundamentals of investigation, especially for the age which precedes the reign of Edgar. Every one knows how largely our information regarding social conditions in England during the first four centuries, and more, after the beginning of the Germanic invasions, depends upon the tariffs of Wergeld which were established in the different kingdoms. Mr. Chadwick opens his first chapter thus: "The classification of Teutonic society in ancient times may perhaps be most conveniently attempted by observing the gradations in the monetary payments to which persons belonging to different classes were entitled in compensation for various injuries. For this purpose a clear understanding of the monetary system is an indispensable preliminary." From money we are taken to the social system, thence to administration, and, from a topographical survey of the older countries in connection with their magnates, to the constitution of the national council, and finally to the origin of the nobility. A large part of Mr. Chadwick's work runs parallel with Seebohm's 'Tribal Custom in Anglo-Saxon Law,' and those who take an interest in primitive conditions will be apt to follow carefully the variation of opinion between the two writers. Mr. Chadwick's chapters are divided into numerous paragraphs with special titles, and over each of these the heading "excursus" might with some fitness be written. But while the text on analysis represents a large number of separate and technical investigations, the volume is not destitute of unity, since each study is made to bear upon some large institution. For the Heptarchic period in particular Mr. Chadwick's results are of real value.

SIDGWICK'S ESSAYS AND ADDRESSES.

Miscellaneous Essays and Addresses. By Henry Sidgwick. The Macmillan Co. 1904.

It is a severe test of an author's work to reprint for the public a collection of essays which appeared, for the most part, in the magazines, and which cover a period of more than thirty years. The volume above named bears it well. It includes a wide range of subjects—economics, education, and literature—and it treats them all with

a solidity, a fulness of knowledge, a many-sidedness, and an occasional sparkle of dry light which keep them alive and informing even when their immediate interest has begun to shift or wane. Most of us have forgotten the stir that was raised about 'Ecce Homo' in the sixties; some of us are already forgetting the dazzling generalizations of Mr. Kidd's 'Social Evolution'; but there are very few who will not be benefited by reading the essays in which Mr. Sidgwick applies a dose of history and of sound reasoning, and brings his piercing analysis to prick the amateurish bubbles of each of these brilliant works.

The long and important essays on Bentham and Benthamism, and on the Relation of Ethics to Sociology, as well as the address before the British Association on the Scope and Method of Economic Science, belong, of course, to the author's specialty, and carry the weight of a distinguished and independent investigator. The remaining papers, on the poems and prose remains of Arthur Hugh Clough, on Shakspere's Methods and the Romantic Drama, on the Pursuit of Culture as an Ideal, and on the Theory of Classical Education, illustrate the extraordinary breadth of Sidgwick's sympathies, as well as the range and depth and thoroughness of his studies. Wide as this range is, there is in his treatment of this varied matter absolutely nothing of the amateur. Whether he is discussing the niceties of the hexameter in English, or the subtleties and affinities of Clough's very subtle genius, the breadth of his equipment is as remarkable as his insight: he need ask no favors nor allowances from the professional littérateur. The discussion of Shakspere's use of Plutarch and of Holinshed, or of his transitions from prose to verse, is full of thought and suggestiveness; it reveals the scholar who knows his editors and commentary well, and his author even better than the commentators. On the whole, with a bent and method which are strictly scientific, Professor Sidgwick here presents in himself an admirable illustration of his own conception of the meaning and value of culture.

The closing essay sums up this ideal, and puts it very clearly: "To pursue culture is to live in the fullest manner, exhausting those higher modes of mental and social life from which our finest human pleasures spring." Whether this is needful he does not discuss: he had never heard of one of our great universities expressly disclaiming culture as the end or aim of any one of its hundreds of courses of instruction. He assumes that culture—the training of a supple intelligence, the ardor of scientific curiosity, the pursuit of ideas—constitutes one of the betterments of life. To join this with a trained taste and sensibility to beauty is "the problem for those who pursue the idea of good." The exercise of these tastes and powers, the assimilation of varied knowledge and ideas, till a man's soul becomes a harmonious organism looking out on the world through many windows, and from each receiving views and impressions which modify and delight the denizens within—this may well be the goal of a general education. The pedant, then, is not a man of culture; the specialist is not a man of culture, even so far as his special knowledge goes—on the contrary, he must strive and struggle against the cramping of his thought, to escape from the prison of his specialty. Science is an exacting mistress, and seems to claim an exclusive devotion. It claimed everything from Darwin, for instance, as it might from Mr. Burbank; but Darwin had a mission, Mr. Burbank is *called*. The rest of us, generally speaking, are not so sure that we have a mission, a *vita vota*. The student, then, must struggle against this exclusive claim of his specialty, against cramps and fetters; and in this "noble conflict," as Mr. Sidgwick calls it, nothing helps more than the habit of delight in the best literature.

The longest and one of the weightest essays is that entitled "The Theory of a Classical Education," which was published in 1867 as a contribution to the collection edited by F. W. Farrar under the name of "Essays on Liberal Education." This is a cool and thorough analysis of the methods and claims of classical education, in England more especially, at that period; and, at the same time, an estimate of the share which Greek and Latin might contribute toward an ideal training and education. It is an estimate made by a judicious and dispassionate friend of classical studies, who understands every side of the subject and treats it with an intimate, inside knowledge of its details. His object is to weigh accurately the exact kind of culture and mental discipline which classical studies may impart, and to settle the rival claims of certain other subjects which should be included in a rounded education. He shows himself in firm possession of the essential facts of the case, while resorting neither to sentiment nor invective, nor to vague and sweeping statements—snares which peculiarly beset the discussions of enthusiastic classicists, and from which the calmer scientist is not entirely free. The old-fashioned headmaster, when rhapsodizing over the mystic virtues that reside in the practice of Latin composition, is, like a fond parent, *capable de tout*—"No religious nation," says Mr. Thring, "can give up Greek!" If Mr. Sidgwick has once lapsed into eloquence, it is in the admirable appeal which he makes for the study of Physical Science as an essential part of the equipment of every thoughtful and intellectual man of our epoch. How can such a man absolve himself from the effort to frame a reasoned synthesis of the facts of the universe? How could the most devout Platonist absolve himself from such an obligation, since Plato once required geometry as the passport to his Academy? At the same time, he protests against the notion that Science and Literature are alternatives between which a choice must be made. He had never met the recent girl-graduate who had spent a painful year on experiments in dredging, and who announced herself as "an engineer, thank Heaven, without culture!" He insists, on the contrary, that all boys, whatever be their special bent and destination, should be really taught literature—to enjoy poetry and eloquence, to interest themselves in history, and in whatever concerns the life and spirit of mankind.

It is not possible to dwell on Sidgwick's minute and careful appraisal of the value of classical training and of its defects; but a few striking points may be summarized. Greek and Latin are not Siamese twins; for educational purposes they may be separated with great convenience and advantage. The main objects of the study of an ancient language may be successfully attained by teaching only one of these two, and for many good reasons that one should be Latin. The vocabulary of Latin is easier to learn and easier to retain; it is profusely mixed and entangled with the vocabulary of English, French, Italian, and Spanish—it explains the meanings of many words in all of these languages, and the verbal forms in three of them. It may almost be said that it saves time to begin a study of the Romance languages with a knowledge of Latin; to annex any one of these to Latin is a highly labor-saving process. Moreover, it is a method to be commended for another reason. For the first two years the beginner in Latin creeps at a snail's pace, and his soul is fed chiefly on Cæsar's 'Gallic War.' It helps much to associate with this some easier language which permits more rapid reading, and, for this purpose, none is superior to French. As the final aim in learning an ancient language is to read its literature, the true way to attain this power is to read and to keep on reading, carefully and with comprehension. To *write* Latin is a very different matter. It is useful to fix the idioms and the grammar; but anything beyond this is surplusage. So far from being a useful introduction to English composition, as some of the schoolmasters contend, it might prove a damage to English style. Neither Shakspere nor Aristophanes had the privilege of such practice. Each language has its own rhetoric, in a way its own idiom and laws of periodic rhythm. The practice of another language is not likely to further acquaintance with these; it might, indeed, blunt the natural instinct, the unconscious tact which are essential to the bloom of literature. No great stylist ever wrote his best in a foreign tongue—much less, therefore, a great poet. Latin or Greek versification is a sort of embroidery to be cultivated by those who have the knack of it. Professor Jebb's lyrics may even be useful practice for an editor of Sophocles or of Pindar. They give pleasure to himself and to scholars. Would they have given pleasure to Pindar?

In this general appraisal of the results of classical training, Sidgwick compares it with that afforded by the sciences. He remarks that the discipline derived from the study of language is, within certain limits, analogous to that afforded by the study of any one of the natural sciences; each of them exercises memory, attention, comparison, generalization, and the application of rules, the habit of applying these with quickness and accuracy, and finally the habit of using the faculty of judgment. Of course, this quasi-scientific discipline does not come at all to the student who avails himself of the short-cuts offered in Bohn's Library. Nor, again, does the study of language afford the slightest discipline in the most important of the scientific habits—the habit of reasoning from effects to causes and from causes to effects. For this discipline we look naturally to physics and chemistry. "The training in classification which most immediately fits us for life, is that which the natural sciences afford; the processes which the student applies in these, afford just the lessons in method and arrangement which he must apply to any part of the

business of life." So, at least, thinks Sidgwick, and in this we follow him with some misgiving.

The upshot of Sidgwick's heresies goes no further than to recommend that schoolboys should receive a substantial course of instruction in English literature and in natural science; and that the study of Latin should be accompanied by the study of French. Greek he would exclude from the earlier stage of the school curriculum; at the age of sixteen a boy who is already well grounded in Latin and French would readily grasp sufficient Greek for an appreciation of the literature. He is strongly opposed to "teaching a large number of things all inadequately and superficially, so that verbal memory is substituted for real apprehension." This was the programme which Sidgwick urged in 1867; he is arguing with schoolmasters who believe in the primacy and the divine right of the classics, and he is obliged to make an appeal for a modicum of science and of English. It is interesting to see how completely the tables are turned in the present day and in England. The recent debates at Oxford, it is true, revealed a few glimpses of the ancient bigotry; and at a meeting of "The Classical Association of England and Wales," Professor Ramsay reported from certain enthusiasts—a land agent, a distinguished surgeon, and a general—how in moments of trial they had been sustained by the vigor and dexterity acquired in writing Latin verses. Such pious faith it would be irreverent to gainsay or dispute. But the general tone of that discussion is of men on the defensive, driven back to the entrenchments of sober common sense and practical usefulness. An avowed object of the Association is "to improve the practice of classical teaching by free discussion of its scope and methods."

On our side of the water Sidgwick's programme offers no surprises. If he had been summoned as privy-councillor, the colleges and universities could hardly have followed his advice more implicitly. We are speaking, of course, of those universities which are something more than groups of technical or strictly professional schools. The predominance of English, the requirement of some science, are firmly established; the combination of Latin and French or German, or both, is almost universal; while for many years instructors in the classics have been conspicuously sober and moderate—chastened, almost—in their claims. One surprising result of the adoption of this scheme of studies is the extraordinary pedestal to which Latin has been raised, and its unaccountable popularity.

The wise and able report of the "Committee of Twelve" experts on classical studies in the secondary schools took final shape in 1898, and presented a remarkable situation. This was, in brief, that while the increase of pupils in the secondary schools, within nine years, far outran the increase of population, the enrolment of pupils in Latin exceeded the rate of increase in any other study; it had, in fact, gained 174 per cent., while that in Greek had gained 94 per cent. About one-half of all the pupils took Latin, while about one student in twenty chose Greek. The Committee expected "in the next decade an even more rapid increase in the enrolment in Greek." This expectation is far from being fulfilled. Commissioner Harris's tables show that in 1902 the total number of students in Greek had actually fallen off about three thousand from 1898, while the Latin enrolment had gained fifty thousand; algebra alone had displaced the supremacy of Latin in the public high schools.

Dr. Collar, after a lifetime spent in teaching Latin, makes an elaborate confession that he is struck more and more with the difficulties it presents to the tyro. Roger Ascham, who wrote Latin fluently, compromised slightly with its subjunctives, and managed nevertheless to maintain his scholarly peace of mind. Sidgwick keenly observes that, though Latin grammar forms an excellent introduction to the principles of universal grammar, yet nine-tenths of the special rules of Latin syntax the ordinary student may conveniently and cheerfully forget. All this goes to prove that the vogue of Latin is somewhat artificial; like Greek, though in a less degree, it requires to be a *protected* study. If Latin ceased to be required for admission to college, if it were begun in the university, how long would its extraordinary vogue flourish? Protection in such cases seems entirely justifiable. It is the function of the university not merely to meet the wants of the people, but to dictate to the people, to prescribe *de haut en bas* their tastes and training. In the realm of intellect "the rule of the many is not good," a strict democracy is impossible.

It is quite certain that there is something a little artificial in the present depression of Greek study in this country. It has been the subject of a strong and deliberate "bear" movement. It has been pelted skilfully with epithets which would be successful in any political caucus; it has been called "dead," a fetish, and, worst of all, "unpractical." That single word would settle its merits in the eyes of parents who do not reflect that chemistry is unpractical, or mathematics, or any modern language, in a sense, if it lies fallow and disused in a student's mind after leaving school or college. Much more is their judgment influenced when such assaults are made by men in high places in education. Again, there is no true sense in which a poem of Sappho or a play of Euripides can be called dead. The latest vaudeville or melodrama is more accessible, but it is not so much alive. The "Agamemnon" or the "Medea" may outlive "Pelléas et Mélisande," or "The Second Mrs. Tanqueray."

The "Lecture against Lecturing," sustains with delightful humor and originality a thesis advanced by Darwin in his autobiography. Why should students be compelled to listen to lectures if they can read and digest the same matter at leisure from the printed page, or the instructor can provide it in a printed form? In reading, the quick and clever student can vary his pace and compare passages at his own convenience; he can skip what is familiar, and dwell on what he finds difficult, and this is a much greater advantage than any help which he derives from the inflections and emphasis of the lecturer. The very act of taking notes interferes with the benefit that might be derived from attention to the speaker's voice and manner. The task of taking notes, at its best, is the task of a stenographer, and in its final result is equivalent to the process of multiplying copies by the printing-press. Neither is it so accurate as printing. The student mishears occasionally, and is misled by his own mistakes. He may spell "the universal I" with an *eye* as a faithful pupil is said to have done in his report of a series of lectures on the doctrines of Transcendentalism. Is not the practice of lecturing, then, in many cases, a wasteful survival of the mediæval schools before the invention of printing?

There are, of course, exceptions and limitations. Some classes of lectures cannot be dispensed with—for example, those on science and art in which experiments or specimens must be introduced; and discourses which appeal to the emotions or in which the method is dialectic. But in linguistics, in mathematics, in history and moral science, the ordinary expository lecture is an "antiquated survival." The student, if he has any intelligence and eagerness, should first of all be supplied with printed sources, and the lecture should be supplementary, devoted chiefly to explanations and discussions of difficulties. The lecturer should be encouraged to print his own contributions to science, and put them in the pupil's hands, instead of holding them back as he does now. At present, if he prints, his secret is out—he has killed the goose that lays the golden egg, if the comparison be permitted. It is a pity that such motives and such a predicament should trammel the progress of the student. It is for the élite that Sidgwick recommends this economy of time. In the case of the ordinary academic crowd, it may increase, perhaps, the chance of their learning something if they are dragged to lectures at stated hours. Yet it is well known that, in our largest university, droves of students are daily led to such fountains of knowledge chiefly in the forenoon hours, and that they successfully escape drinking the refreshing waters. They prefer to wait till the last moment and resort to Sidgwick's aid of the printed pages or abstract; they do this at the end, however, instead of at the beginning of their terms. Their case is a capital illustration of the futility of lecture-courses for the multitude and the common herd, if anything serious is to be accomplished. There is a further exception to be made to these strictures. A great or unusual personality may be so impressive and inspiring that it is more fruitful to listen to him than to read the printed pages. Most of us are fortunate enough to recall instances of this kind—the speaker whose thought flows fresh as he speaks, and kindles the thought of his hearer. Such a gift may warm even a lecture on Modern Algebra or on the Law of Torts, and the fortunate listener will do well to take a minimum of notes and give the undivided attention of his brains.

BROWN'S HOGARTH.

William Hogarth. By G. Baldwin Brown, M.A. (The Makers of British Art.) London: The Walter Scott Publishing Co.; New York: Charles Scribner's Sons. 1905.

In the preface to this book the author comments on the varied products of Hogarth's genius, and goes on to say:

"The relations of these very different kinds of work to each other and to his whole *œuvre* are not easy to fix, and the

judgments of critics on their comparative values have varied from age to age. Hence there is always room for a fresh and independent treatment of Hogarth's life and art, such as is attempted in the following pages."

In his own time, and immediately afterwards, Hogarth made such an impression by the obviousness of his moralizing and satirizing that his qualities as a painter were hardly thought of at all, and it was almost forgotten that he painted pictures—not merely designed moral plates to be spread abroad by cheap engraving. His earlier commentators were literary men who thought only of his meanings, never of his art, and Charles Lamb conceived he was paying him the highest possible tribute when he said: "His graphic representations are indeed books; . . . other pictures we look at—his prints we read." Gradually it has dawned upon the world that Hogarth was a sound and admirable painter, if not a brilliant one, and that his little *genre* pictures, entirely apart from their literary value, are capable of giving a pleasure analogous in kind, if not comparable in degree, to that afforded by the works of the wonderful little Dutchmen; while his portraits, if they have not the sensuous charm of those of Reynolds or Gainsborough, are yet solid and serious presentations of human personalities. The more his work has been studied from this fresh point of view, the better it has been liked, and there has been a tendency in each new treatment of Hogarth to rank him higher as a painter; but until now no one has had much to say for those "historical pictures" which the artist himself was quite sure were equal to the works of any old master whatsoever, but which no one else could be induced to take seriously.

Strangely enough, Hogarth was himself largely responsible for the contempt with which his most ambitious efforts were treated. He believed them to be great works, but his hatred of foreigners, his scorn of pretence, and his robust self-conceit led him to minimize the effort they had cost him and the degree of his preparation for them, and to proclaim himself self-taught. He shouted aloud: "See how easy it is! This I did with no study of your Italians, with no humbug about the grand style, with no training but a habit of observation." The world took him at his own valuation, but refused so to take the pictures, and considered them the amateurish and rather impudent efforts of an uneducated artist, who had no business to leave his copper-plates and set up for an historical painter. Listen to Northcote, Sir Joshua's pupil, echoing and exaggerating his master's opinions: "As to his large pieces," he says, "they appear to be the efforts of imbecility; he was totally without the practice required for such works."

The originality of Professor Brown's book is in his effort to show that these much-decried works are far more respectable than they have been thought, and that Hogarth's preparation for them was far greater than he chose to believe—that, in fact, he was fairly well grounded in the traditions of art, and worked in the style of his own time and school. "The blunderers in the matter of historical painting," says Professor Brown, "were not Hogarth or his predecessors, but the later men of the period after Reynolds, who took themselves seriously"; and, again: "To Reynolds, and through Reynolds to his successors, this 'grand' or 'historical' style became a mystery that was to be approached in the spirit of a candidate for initiation. There is really no mystery about the style. It is simply figure-painting on a monumental scale applied to subjects of a religious, or classical, or allegorical order."

From reading the text alone of this book, one might believe that Professor Brown had fairly well made out his case, and, indeed, an inspection of the plate of "The Pool of Bethesda" is sufficient to show that that picture is by no means the work of an audacious innovator relying entirely on his own genius and his personal observation of nature. Its faults are many, but the most obvious of them is its utter conventionality. It is an evident piece of imitation of the traditional art of the earlier eighteenth century, and, but for its lack of elegance, might be labelled "made in France." But because Hogarth was unoriginal in this work, it does not follow that he was well equipped for it, or because it was done before he was forty that it was not the experiment of a painter trained in another school. The question really resolves itself into that of the justice of Sir Joshua Reynolds's strictures on Hogarth, which are quoted as follows:

"After this admirable artist had spent the greater part of his life in an active, busy, and, we may add, successful, attention to the ridicule of life; after he had invented a new species of dramatic painting, in which probably he will never be equalled, . . . he very imprudently, or rather presumptuously, attempted the great historical style, for which his previous habits had by no means prepared him; he was, indeed, so entirely unacquainted with the principles of this style that he was not even aware that any artificial preparation was at all necessary."

Professor Brown tries to show that Reynolds was wrong both in his statement of fact and in his criticism. As to the facts, Appendix I. shows clearly, as the text does not, that Reynolds was substantially right. "Hogarth's ambitious efforts at St. Bartholomew's," says the Professor, "date from an early epoch [1736] in his career." Now, as Hogarth was born in 1697 and died in 1764, he may quite literally be said to have spent the greater part of his life before 1736. But if that is a quibble, let us consider these dates. Hogarth's first plates date from 1720, his small "conversation pieces" in oil from 1725, so that he had been an engraver for sixteen years and a painter for ten before he tried the grand style. The "Harlot's Progress" was published in 1732 and the "Rake's Progress" in 1735, so that he had certainly invented his "dramatic painting," and, indeed, perfected and long practised it, before he began "The Pool of Bethesda." Reynolds may have been thinking of the "Sigismunda" of 1759, and have forgotten earlier essays in the same direction; but his instinctive feeling that Hogarth had abandoned a style of work in which he was a master for one in which he was a novice, was justified by the facts. As to the criticism, he was still more indisputably in the right. It is all very well to sneer at Reynolds's solemn phrases about the "great historical style," but, after all, there is something more requisite to the style he called by that name than will fit out an admirable painter of *genre*. The "grand style" is, if you like, "nothing more than figure-painting on a monumental scale"; but that scale, and the difference of subject, do demand some "artificial preparation." The composition which is quite satisfactory for a "conversation piece" will not answer for a great monumental picture; the observation which will insure the lifelike representation of a beadle or a bailiff will not extend to the beautiful rendering of the nude figure; the skill in coloring which will make charming a canvas thirty inches long, will not make splendid one of thirty feet. The two arts are eternally different, and success in either does not guarantee success in the other. Probably Veronese could not have painted like Ver Meer—certainly Ver Meer could not have painted like Veronese.

That Reynolds himself was but an indifferent practitioner in the "grand style" is nothing to the purpose. He could not produce it, any more than could Fuseli or Barry or Haydon, or any other English painter; but he knew what it was, he knew that Hogarth had failed in it, and he had a perfect right to say so. *Tu quoque* is the poorest of arguments. If Reynolds might not criticise the performance of Hogarth because his own was little better, what becomes of the right of any of us, including Professor Brown, to criticise Reynolds? And that we have discarded the vocabulary of eighteenth-century criticism, that we have readjusted the eighteenth-century scheme of values, that we recognize a great artist in Chardin and suspect a pompous humbug in Anibale Caracci—all this is no reason for confusing unlike things, and maintaining that Chardin could have decorated the Sistine if he had had the opportunity, or that Hogarth was other than a bungler in his attempts at monumental painting.

If we have devoted so much space to this topic, which really occupies but a small portion of the book under review, it is because it is the only portion which is especially new. With the exposition of the better known side of Hogarth's art, as with the account of his life, we have no quarrel. Indeed, it is partly because the volume is much better than the average of the series to which it belongs that we have noticed it at such length. But, really, a Professor of Fine Art in the University of Edinburgh should have a better sense of perspective.

The Evolution of the Constitution of the United States of America, and History of the Monroe Doctrine. By John A. Kasson. Houghton, Mifflin & Co. 1904.

Mr. Kasson's account of the Evolution of the Constitution was originally written at the request of the Constitutional Centennial Commission. The first edition was published as a part of two memorial volumes, and was soon exhausted. The present revision is designed to meet a popular demand, and for the use of students of Constitutional law. For this purpose the concise historical method adopted by the author is well fitted. In a couple of hundred pages he contrives to give an account of the organization of the Government (as well as of the events which led to it) in a narrative form, while the proceedings of the Convention are classified by subjects, *e. g.*, the legislative power, the

judicial power, the executive power, in the usual way. This ought to be a good handbook for beginners, but is not a lawbook, and does not cover the field occupied by such a book as Cooley's well-known treatise.

Fifty pages are added on the history and theory of the Monroe Doctrine, which Mr. Kasson declares "has acquired so much authority, both at home and abroad, that its influence over our people and their representative statesmen has become almost equal to that of a provision of the National Constitution." We do not know that Mr. Kasson's theory of the Doctrine is original, but it is certainly very comprehensive, and we suppose reflects pretty accurately the views of those now in power. We cannot witness any new colonization by European Powers, nor any new European military or naval position "in whatever way acquired"; nor, again, the transfer to any other European Power of any existing colony. Mr. Kasson admits that the Doctrine is not a part of international law, and does not bind other nations, but thinks it an effective reply that the European doctrine of the Balance of Power was not international law either. But this is not the real *crux* of the Monroe Doctrine. The Balance of Power was *quasi*-international law for such nations as assented to it, though it might infringe the rights of others; the Doctrine is in conflict with the ordinarily recognized rights of every nation, and hence, if it is to be permanent, must be imposed upon the world by us single-handed. Mr. Kasson seems to think that our correlative obligation not to colonize or interfere in Europe makes it a two-sided arrangement; but since we have taken the Philippines from a European Power, in the quarter of the globe where expansion is most attractive, this is neither obvious nor maintainable.

The Doctrine, as here expounded, prohibits any European Power from settling questions at issue with American States as it otherwise might. Such a power may make war, but may not secure the fruits of conquest; it may collect debts by seizure of custom houses, or by other measures "short of war," but may not permanently hold anything. On the other hand, we notice (p. 269) that our relations with Canada are already causing "anxiety to thoughtful American statesmanship," from which there now appears no certain issue "except its independence." If we ask ourselves what the Doctrine, so interpreted, means, not to us, but to Europe, it is impossible to avoid the conclusion that it creates for the United States a virtual protectorate of the American continent. If we shield Venezuela or San Domingo from the consequences of their acts, we assume a responsibility for these governments which we can never escape. Thus, the Doctrine is actually producing a receivership of San Domingo under our protection, while our fatherly interest in Venezuela is leading no one knows yet to what. In the end we shall probably escape from such consequences as we do not like by disregarding the extreme view of the Doctrine here put forth; but why is it necessary to have a "doctrine" at all? The devotion to it of shrewd, long-headed public men like Mr. Kasson is always a little surprising to us. It seems with American politicians to have taken the hold upon their minds which religious dogma might once have gained, and any new definition of it becomes more and more positive and less and less practicable. After all, the relations of States with one another can no more be regulated by a doctrine than the relations of individuals. To educate people to regard it as a fetish is full of danger, and, one may add, absurdity.

In and Around Venice. By Horatio F. Brown. London: Rivingtons. 1905.

It is many years since Mr. Horatio Brown began those delightful sketches of Venice which he subsequently gathered into a volume entitled 'Life on the Lagoons.' They showed him to be better qualified than any other Englishman of his time for writing such sketches. He had lived long in Venice, not as a foreigner, but as one in full sympathy with the people; he loved their customs, their legends, their life; he had a marked talent for description, and a thorough acquaintance with the fine arts; and, later, he made himself conversant with Venetian history. So his sketches were not the mere impressions or emotions of the passing foreign tourist, but such intimate revelations as a cultivated Venetian might have made for his English friends.

Mr. Brown's new volume has the same characteristics. The variety of topics is very wide; it includes seven papers "In the City," as many more "On the Lagoon," and nine "In the Country." As an introduction, there is a general rambling essay on Venice, which, in spite of many attractive parts, gives one the impression of being a warming over of material which Mr. Brown has served more appetizingly at other times. The short papers vary as widely in subject as in treatment. Here one finds a careful account of the Campanile of San Marco and the loggetta of Sansovino, followed by a diagrammed description of the columns in the Piazzetta, which an architect might prize; there he describes, with vivid realism, floods on the mainland, or, with an Alpinist's enthusiasm, relates his ascent of Pavione. His trips to the mainland, including a voyage to Istria, furnish several papers on out-of-the-way places, which one is glad to see through his eyes. Very keen eyes they are, missing no detail of nature or of art, and so sensitive to color that many of his descriptions might be a landscape painter's memoranda.

Mr. Brown has the happy gift of desultoriness. He can, if required, write a matter-of-fact statement; but more often his style goes clad in agreeable garb, and he pauses at will to throw in a reflection, or to explain an historical difficulty, or to tell a story. Being saturated with Venetian lore, he rarely introduces it of set purpose. It is in this lack of insistence, in this ability to suggest an atmosphere, that he differs from most alien writers on Venice. Take the 'Italian Backgrounds' of Mrs. Wharton, for instance, and you will find them by comparison the work of a foreigner; delightful work of their kind, and revealing a sympathetic understanding of Italy, yet still foreign—just as Symonds's sketches are—with a didactic or an insistent manner of discussing art and life which Mr. Brown long since outgrew. Some of his papers are slight, and in others there are repetitions; but, taken as a whole, this volume is a worthy successor to 'Life on the Lagoons.'

Essais d'Histoire Diplomatique Américaine. Par Achille Viallate. Paris: Guilmoto. 1905.

The favorable impression produced by M. Viallate's book is the result of what may best be described as a cumulative process. Although two-thirds of the matter deals with such burning, or lately burning, questions as Panama and the Spanish War, yet from his first to his last page there is not one heated word, not one opinion put forward denoting bias of any sort. When such a frame of mind is united to the large and accurate knowledge that is to be expected from a professor at the Paris School of Political Science, the result cannot but be valuable.

M. Viallate deals with three subjects, all related: the two just mentioned, and the expansion of the American people. His method is strictly historical, and his great merit is that, although he is accustomed to look for his facts in diplomatic papers, yet he gives American public opinion—which, alas, is often very undiplomatic—its due place as a rightful political factor. The American reader will find little that is new to him in the account of these various questions, but may be struck by a certain inevitableness of political development that the author constantly accentuates.

The slips are on the whole unimportant, and the proper names are so much more correctly given than is usual in French books, that the occasional mistakes must not be complained of. There are two or three points, however, to which the author's attention may be drawn. In his picture of our relations with Spain the years preceding the civil war, and particularly the period of Mr. Soulé's agitated mission, are inadequately treated. The same remark applies to the Panama Congress. From M. Viallate's account, it would appear that Admiral Ammen approved the Panama route, whereas at the Congress he supported Nicaragua. More generally, it may be said that it was incumbent on the author, however distasteful to a Frenchman, to state clearly that the Panama Congress was packed, that its vote was worthless, and that De Lesseps went into an enterprise he knew nothing about; this was the minimum of what one had a right to look for on that aspect of the subject. In two places, *souveraineté* is used by M. Viallate for our word *control*: the French word is too wide, and in a diplomatic document the alteration of sense might involve very large consequences. In conclusion, it may be said that a translation of this work might be of great use to students at our colleges, who could not but gain by studying our own history approached from the standpoint of such a detached, temperate, and informed observer.

A NEW EDITION RE-WRITTEN AND UP-TO-DATE

of Wallace's Russia $5.00 retail

"In the same class as Mr. Bryce's American Commonwealth."—LONDON TIMES.

"Next to the revised edition of Mackenzie Wallace's monumental work, the most useful account of the actual condition of the Czar's dominions will be found in ——."—N. Y. SUN.

Russia From Within

By ALEXANDER ULAR. $1.75 *net*.

The author believes that the Russian Revolution has already begun. His book analyzes the personality of the Romanoff rulers, the economic and governmental, moral and social condition of Russia. He illumines his conclusions by all manner of information and anecdote. He carries his reader along with him by a style that is clear, eloquent, and witty, with now and then a touch of pathos.

Our Philippine Problem $1.50 net. By mail, $1.64

By Prof. H. P. Willis of Washington and Lee University, former editorial writer on the Evening Post, etc. A frank discussion of our colonial administration based on personal investigation.

Pedagogues and Parents

By ELLA CALISTA WILSON.

$1.25 *net* By mail $1.37.

"An extremely entertaining" book by a thoughtful educator who is first a parent.

"A book to set tongues and pens to wagging."—N. Y. TIMES BOOK REVIEW.

"No teacher but will be aided by reading the conclusions and criticisms."—SCHOOL JOURNAL.

"The triumphant talk of a gifted woman."—CHRISTIAN REGISTER.

"We can heartily recommend it to both (pedagogues and parents) as an entertaining and suggestive contribution."—N. Y. TRIBUNE.

Rhetoric in Practice

By Prof. ALPHONSO G. NEWCOMER and SAMUEL S. SEWARD, JR., of Leland Stanford. 285 pp. 12mo, 90c. *net*.

The backbone of the book is its written themes and oral class exercises, which are fresh, interesting, and bring the composition work of the student into direct contact with his everyday life. Each division of the subject is treated as a unit and may be taken up in any desired order. The teacher can start, for example, with Words, or Sentences, or Punctuation, or Paragraphs, as conveniently as with the Forms of Discourse. He is thus enabled to adjust the book to the training and capacity of any given class.

Goethe's Iphigenie auf Tauris

Edited by Prof. MAX WINKLER, University of Michigan. cv.+211 pp. 60c. *net*.

The introduction gives a particularly full account of the growth of the play and its relation to the Greek sources.

Schiller's Poems

Edited by Prof. J. S. NOLLEN, of Indiana University. xlii.+381 pp. 80c. *net*.

A selection of poems thoroughly representative of the different periods of Schiller's life and work.

Schiller's Dreizigjahrigen Krieges

BOOK III. Edited by Prof. A. H. PALMER of Yale. *With vocabulary*. xxxii+84+99 pp. 35c. *net*.

The Third Book of Schiller's THIRTY YEARS' WAR is recommended by the Committee of Twelve. It is here presented in a form especially adapted to school purposes.

A French Reader based on "Passy—Rambeau's Chrestomathie Française."

By Dr. A. RAMBEAU of the Kansas City High School. 184 pp. 50c. *net*.

Daudet's Robert Helmont

Edited by W. O. FARNSWORTH of Yale. *With vocabulary*. lx+90+60 pp. 40c. *net*.

A vivid account of the siege of Paris and the impressions produced by it upon an eyewitness.

Erckmann-Chatrian; Waterloo

Edited by V. F. FRANÇOIS of the College of the City of New York. *With vocabulary*. xl+145+81 pp. 40c. *net*.

France's Le Livre de Mon Ami

Edited by Prof. O. G. GUERLAC, of Cornell. xxiii + 154 pp. 40c. *net*.

Autobiographical and one of the most characteristic productions of this well-known author.

A MODERN AND DAINTY SHAKESPEARE

A New Pocket Edition of the Complete Works of

WILLIAM SHAKESPEARE

Edited by ISRAEL GOLLANCZ

This latest edition of Shakespeare is a complete handy-volume set of the Plays, Sonnets, and Poems, adapted for use in schools and colleges, as well as for the purposes of private reading. It follows the latest Cambridge text of William Aldis Wright. Introductions to the different volumes, and the commentary which follows the text of each play, are by Dr. Israel Gollancz, the well known Shakesperian scholar and editor.

The type used is long primer, and the text is never crowded. **This is the cheapest large-type edition of Shakespeare ever before the public.** Its convenient size, 4x6 inch cover, total weight 3 oz., clear typography, strong opaque paper, and substantial binding unite to make it attractive and serviceable.

40 PLAYS AND POEMS. UNIFORM BINDING, 18mo.
Special Form for Schools and Reading Clubs. flexible cloth, illuminated covers, 15 cents net; Postage 2 cents extra

DANA ESTES & CO., Publishers, Boston

FOUR MODERN CLASSICS

BY

TUDOR JENKS

In the Days of Chaucer
In the Days of Shakespeare
In the Days of Milton
In the Days of Scott

Here is the way ancient England appeals to the popular mind. Tudor Jenks is the worldly wise scholar, a man of popular mould. To read after him is to walk the streets and mix with the living people of old England.

He has made the merry-hearty England of Chaucer's time live in our imagination.

He creates again our Shakespeare for us—Will Shakespeare, the boy in Stratford, the young man who went to seek his fortune in London and later returned to the life of a country gentleman, a sportsman and a neighbor.

The England of John Milton is the England from which America drew its life, and Mr. Jenks has pictured Milton, the affectionate friend, the blind seer, the lonely prophet of a great new world.

This remarkable set is completed by the story of Walter Scott, his comrades and his romances.

Dr. A. J. George, Professor of English in the Newton High School, says that he shall put these books in the way of his pupils as "tempting morsels."

Each Illustrated. Price $1.00

A. S. BARNES & COMPANY, NEW YORK

Memoirs of Henry Villard

JOURNALIST AND FINANCIER
1835-1900

Two volumes, with Portraits and Maps, $5.00 *net*. Postage, 35 cts.

An autobiographical record of the varied and romantic career of the war journalist who subsequently became a power in the financial world, and carried the Northern Pacific Railroad to completion. Full of incident and valuable for its reminiscences of Lincoln and other prominent men of the time, as well as for its descriptions of important battles of the Civil War.

"A book of extraordinary interest. It is written with great ability, in a clear and flowing style; it details with perfect candor the incidents of a great career; it is an admirable report of great events, all of which the writer saw, and a large part of which (after 1870) he was; it exhibits the rise and growth of a rich and powerful personality and a character at once remarkable for its simplicity and its variety."—John White Chadwick, in the *New York Times* Saturday Review.

"This posthumous autobiography of the late Henry Villard is a work of exceptional interest."—*Commercial and Financial Chronicle*, November 12, 1904.

HOUGHTON, MIFFLIN & CO., Boston & New York

School Trustees, Principals, Teachers,

And others interested, are invited to consider the advantages offered by the *Nation* as an advertising medium. School advertisements are printed in a uniform typography, with the address in the first line, classification being made by States, alphabetically, unless especially ordered displayed on other pages.

The *Nation*, in its special field of political and literary criticism is unlike any other periodical, American or foreign. About 10,000 copies are circulated weekly, but these figures do not accurately represent the number of its readers. It is taken by reading clubs and literary associations in a large number of places, and may be found on file in every library of importance in the country. There are probably few weekly periodicals whose columns offer so favorable an opportunity for reaching an audience interested in educational matters.

Advertising rates, 15 cents a line each insertion, with the following discounts: 5 per cent. on 4 insertions, 10 per cent. on 8 insertions, 12½ per cent. on 13 insertions, 15 per cent. on 26 insertions, 20 per cent. on 39 insertions, 25 per cent. on 52 insertions.

The *Nation* is sent free while advertisement continues.

Orders may be forwarded through any responsible advertising agency, or directly to

The Nation, 208 Broadway, N. Y.

To receive the current numbers in a convenient (temporary) form. Substantially made, bound in cloth, with The Nation stamped on the side in gold. Holds about one volume. Papers easily and neatly adjusted. Sent, postpaid, on receipt of 75 cents.

RECENT PUBLICATIONS

Ferris's Elements of Descriptive Geometry

$1.25

Unlike other books of its kind, this volume deals with all its problems in the third angle—a method most favored by engineers. The work forms an admirable presentation of the subject, treating of definitions and first principles; problems on the point, line and plane; single curved surfaces; double curved surfaces; intersection of single and double curved surfaces by planes and the development of surfaces; intersection of solids; warped surfaces; shades and shadows; and perspective. The author presents for each problem a typical problem with its typical solution, and then gives numerous examples, both to show variations in the data and to secure adaptability in the student. The book contains 113 figures.

Avery's School Chemistry

$1.20

This book is designed to meet the wants of all secondary schools in chemistry, and to provide a satisfactory text, a sufficient amount of individual laboratory work, and suitable lecture-table demonstrations. It is an entirely new book, and possesses the various pedagogical features that have made the preceding volumes of the Avery Series so successful and popular. Clearness and accuracy of statement mark the definitions, directions and explanations. The experiments are simple and instructive, easily performed, and adapted to the use of inexpensive and easily obtainable apparatus. Unusual space is devoted to chemistry as applied to important industrial processes.

HIGH SCHOOL CATALOGUE

LIBRARY SERVICE

We aim to serve librarians with the greatest efficiency. We have

(1.) Competent and thoroughly equipped book men.
(2.) The largest miscellaneous book stock in New York City.
(3.) A valuable line of order lists —as follows—

A. Monthly Bulletin of the Latest and Best Selling Books.
B. Standard Library Catalogue.
C. Clearance Catalogue.

Do You Get These? Sent Free.

THE BAKER & TAYLOR CO.
WHOLESALE BOOKSELLERS,
33-37 E. 17th St., Union Sq., North, New York

The Lowell Offering

A reprint of the famous magazine written entirely by the mill girls of Lowell, in 1845, is one of the new leaflets just added to the Old South series.

Send for complete lists.

PRICE 5 CENTS A COPY. $4 PER 100.

DIRECTORS OLD SOUTH WORK
Old South Meeting House
WASHINGTON STREET, BOSTON

To receive the current numbers in a convenient (temporary) form. Substantially made, bound in cloth, with THE NATION stamped on the side in gold. Holds about one volume. Papers easily and neatly adjusted. Sent, postpaid, on receipt of 75 cents.

NEW BOOKS

A COLLEGE ALGEBRA

By HENRY BURCHARD FINE, Professor of Mathematics in Princeton University.

List Price, $1.50.

The author has sought not only to explain the processes of Algebra, but also to expound the notions on which the science is based and its methods of investigation and demonstration.

A COURSE OF EXERCISES IN QUANTITATIVE CHEMISTRY

By Harmon Northrop Morse, Professor of Analytic Chemistry in Johns Hopkins University.

Ready September 10, 1905

Beginners in quantitative chemistry will find this book a helpful guide. It is designed to familiarize the pupil with as great a variety of quantitative operations as is possible in a limited amount of time.

MATHEMATICS

Smith and Gale's Elements of Analytic Geometry.
Smith and Gale's Introduction to Analytic Geometry.
Granville's Differential and Integral Calculus.

Ready September 10, 1905.

NORTHERN TRAILS

Stories of Animal Life in the Far North

By WILLIAM J. LONG

Readers of this collection of entirely new stories are brought face to face with the wild life along the coasts and in the barrens of Labrador and Newfoundland. The chapters include stories of the white wolf, the salmon, the whale and the polar bear.

This is the first book which Mr. Long has written since "A Little Brother to the Bear" was published in 1903.

NATURAL SCIENCE

Wentworth and Hill's Text-Book of Physics Revised Edition.
Trafton's Laboratory and Field Exercises in Physical Geography.
Morley's Butterflies and Bees.
Lane's Summer.

COMMERCIAL BOOKS

Anderson's American Phonography.
Atwood's A Practical Commercial Speller.

(*Ready in September.*)

Huffcut's The Elements of Business Law.

BOOKS OF GENERAL INTEREST

Ripley's Trusts, Pools and Corporations.
President Roosevelt's Railroad Policy.

(*Ready in September.*)

Common's Trade Unionism and Labor Problems.

BOSTON NEW YORK **GINN & COMPANY, Publishers** CHICAGO LONDON

A book of exceptional interest at the present time

JUST PUBLISHED

The Far East

BY

ARCHIBALD LITTLE

"Author of Through the Yangtse Gorges," "Mount Omi and Beyond," etc.

8vo, cloth, $2.00 net

Comprising Japan, Siam, China, The Yellow River, The Yangtse River, The Province of Szechuan, The Chengtu Plateau, The Lower Yangtse Provinces, The Intermediate Provinces, Yunnan to Canton, Manchuria, Mongolia, Turkestan, Tibet, Indo-China, and Korea.

With Nine Maps and Thirty-seven Illustrations

For Sale by all Booksellers. Send for Catalogue

The New Books and September Announcements of

THE MACMILLAN COMPANY

NOW READY

A History of Political Theories from Luther to Montesquieu

By WILLIAM ARCHIBALD DUNNING, Ph.D., Lieber Professor of History and Political Philosophy in Columbia University.

Professor Dunning continues into the 18th century the review begun in his "History of Political Theories, Ancient and Mediæval," which is an indispensable part of the preparation essential to any thorough study of the subject of modern politics.

Cloth, 8vo, $2.50 net (postage 17c.)

READY THIS WEEK

Mr. Edwyn Sandys's Sporting Sketches

Describes red letter days afield by one who has enjoyed the cream of American sport wherever it may be found.

Cloth. Illustrated. $1.75 net. (Postage 15c.)

Mr. Eden Phillpotts's *new novel* Knock at a Venture

Deals with such natives of Dartmoor as have figured in the racy, quaintly humorous rustic episodes of his "Secret Woman" and other novels. *Cloth, $1.50*

READY NEXT WEEK

Dr. Austin Flint's Handbook of Physiology

By AUSTIN FLINT, M.D., LL.D., Professor of Physiology in the Cornell University Medical College. Richly illustrated.

An Atlas of forty-eight reproductions of histological specimens, *in the colors actually seen under the microscope*, is an achievement never before possible in a text-book of moderate price. *Cloth, 8vo, $5.00 net (carriage extra)*

Prof. Paul S. Reinsch's Colonial Administration

is the third of the series including "World Politics" and "Colonial Government," by Prof. Reinsch of the University of Wisconsin. *Citizen's Library. Half leather, $1.25 net (postage 11c.)*

Mr. William E. Smythe's Constructive Democracy

is not a catalogue of evils, but a bold program for constructive progress. It is full of sane optimism.

Cloth, 12mo, $1.50 net

TO FOLLOW DURING SEPTEMBER

Mr. Henry S. Haines's Restrictive Railway Legislation

Follows the full growth of railway legislation corresponding to the development of the existing system in its incorporation, finance, construction, operation and traffic. *Cloth, 12mo*

President Henry C. King's Rational Living

presents in a most valuable and direct way some practical inferences from modern psychology. *Cloth, $1.50 net*

Prof. Frank W. Blackmar's The Elements of Sociology

is intended to furnish the general reader, for whom such topics are in the air, with a brief outline founded on the principles established by standard authorities.

Citizens' Library. Half leather, $1.25 net (postage 11c.)

Miss Beulah M. Dix's *new novel* The Fair Maid of Graystones

is an interesting story from the period Miss Dix has made peculiarly her own, in "The Making of Christopher Ferringham," "Blount of Breckenhow," etc. *Cloth, $1.50*

Mr. John Luther Long's Heimweh *and other stories*

are full of the same indescribable thrill that is felt in the beauty of his "Madame Butterfly," etc. *Cloth, $1.50*

Mrs. Roger A. Pryor's Reminiscences of Peace and War

New Edition.

Contains additional chapters and added illustrations.

Cloth. cr. 8vo, $2.00 net (postage 21c.

A LIMITED LIBRARY EDITION OF

The Works of Maurice Hewlett

Uniform with the works of Walter Pater and of Matthew Arnold. Limited to 500 numbered sets on large paper. Eleven volumes, to be issued monthly beginning with "The Forest Lovers" in September, "Richard Yea-and-Nay" in October, "Little Novels of Italy" in December, etc.

Each $3.00 net

THE MACMILLAN COMPANY, Publishers, 64-66 Fifth Ave., N.Y.

The Nation.

NEW YORK, THURSDAY, SEPTEMBER 7, 1905.

The Week.

September 5 is the memorable historic date of the Treaty of Portsmouth, signed, sealed, and delivered. The diplomatic ceremony calls for no remark beyond what the preceding agreement elicited. Whatever may be thought of Franklin's saying that he never knew a good war or a bad peace, we believe the consummation just ratified will never be stigmatized as a bad peace.

President Roosevelt's reply to the Emperor William's congratulations ought to make some English newspapers particularly ashamed. They set afloat the basest and, as it now appears, the most unfounded suspicions in regard to the Kaiser's attitude during the peace negotiations. They asserted that his interview with the Czar was deliberately sought in order to frustrate Mr. Roosevelt's efforts to bring about a peace. Throughout, a certain class of journalistic Teutophobes in England have represented the German Emperor, not only as their own malignant enemy, but as an insidious meddler with the Russo-Japanese negotiations, casting all his influence upon the side of war. All these lies the President now openly nails to the counter. Knowing how maliciously they have been circulated, he goes out of his way to assure the Kaiser, and also to notify the world, that the cordial sympathy and efficient coöperation of that monarch had been of the greatest aid in the whole momentous affair. It was both a generous and timely act on the President's part. The cable reports that it caused much satisfaction in Berlin. Nothing is said of its effect in London, but it must have been to fill the offices of the *Times*, *Telegraph*, and *Morning Post* with smart and mortification.

China is now to put in a word. In response to an Imperial order for recommendations as to future policy relating to Mantchuria, two powerful Governors, Tuan Fang of Hunan and Lu Yuanting of Kiangsu, have urged, according to the (Shanghai) *Shempao:* (1) To decide by conference on a date for the evacuation of all foreign troops; (2) to decide similarly the date for abolishing Japanese military administration in Mantchuria; (3) to open Mantchurian ports to foreign trade; (4) to cede the Eastern Railway concession to Japan; (5) to settle the future of Russian leased territory (Port Arthur and Dalny) with Japan; (6) to reform the Chinese administration system in Mantchuria and suppress the "hunghutzes." Coincidentally, Hsu Shih Chang, senior vice-president of the Board of War, has started on a series of visits, first to Tokio, next to Washington, then to London and the capitals of Europe. The cable reports that "the principal object of the mission is to study the system of government abroad, as the Dowager Empress intends to issue a decree at the new year for the establishment of a parliament twelve years hence." The world has been waiting for that ever since Kublai Khan sent to Rome, through Marco Polo, for a hundred men to show him how the West could instruct China.

Secretary Bonaparte has set aside a part of the findings of the court of inquiry in the case of the *Bennington* disaster, and decided that Commander Young must himself be tried on the charge of neglect of duty. The Secretary thus serves notice on all the officers in the service that they will be rigidly held to their responsibility. The court of inquiry found it to be beyond dispute that discipline in the engineering force of the *Bennington* had been allowed to become exceedingly lax. The facts also were that the boilers and machinery had been permitted to get into bad condition. In endeavoring to fix the blame, the court of inquiry stopped at Ensign Wade; but Mr. Bonaparte carries the responsibility higher. He holds that no ship could get into the unsatisfactory and even perilous state of the *Bennington* without negligence on the part of her commander. At any rate, that is the fair presumption until Commander Young is able to prove the contrary. Such prompt and emphatic action as the Department has now taken will be of itself a sharp warning to every idle or slack officer in the navy. Secretary Bonaparte's deep indignation lends color to the report that he will require junior officers to take their regular tours in the engine-room, to accept direct responsibility for the condition of boilers and machinery, and to maintain strict discipline among the petty officers and men there. The work in the engine-room, with its dirt, grease, and heat, is less agreeable than that on the deck or the bridge, but on a modern war vessel it is not a whit less important. Indeed, the vessel is simply one huge and intricate piece of machinery; and the men in command, if they are to understand its construction and preserve its efficiency, must devote a considerable portion of their time to the engine-room.

No matter how many times it may be demonstrated to the Filipinos, patiently and logically, that they would only make a muddle of self-government, they keep coming back with "Let us try, anyhow." No child could be more unreasonable. The resigned good humor with which the members of the Taft party listened on August 29 to the pleas for Filipino independence was properly indulgent. True, "volleys of questions" were fired at the Filipino speakers at Manila by Messrs. Hepburn, Grosvenor, Payne, and their colleagues, but who believes that they will still the national aspirations for all time? Even the thorough measures of pacification adopted by Hell-Roaring Jake Smith in Samar only a few years ago were not so permanent in their effects as to relieve our troops of the necessity of fighting 38 battles and skirmishes in the island in the year ending last July, with the customary ratio of killed, 6 Americans to 600 or 750 natives. And, in passing, it is interesting to speculate why the American people had to wait for Gen. Carter's belated official report for the news of these engagements, while the "general opinion among the Congressmen present" adverse to Filipino independence comes so promptly over the cable.

Gen. Wood, sailing for the Philippines, left behind him two observations which must subject him to grave censure by two of the most powerful elements in this country. "The need of free trade [with the Philippines] is obvious," said the fearless soldier. "Free trade will injure no American industry." Imagine the wrath of the Society of the Standpatters when they read that! And as if this were not a sufficient blunder in strategy for one day, Gen. Wood went on to say that wages had risen so rapidly and so high in the Philippines as to do the working people there "great harm." It is well that he is on the high seas and thus safe from the avenging tongue of John Mitchell. It is not that he and the other leaders of labor unions care very much about the Philippines, but they think it pernicious to speak of high wages in that way. If such notions are not sternly put down, people may come to believe what the Catholic priest wrote President Roosevelt about the mine workers, that, the bigger their pay, the more money they spent on bad whiskey; and, the shorter their hours, the more time they loafed away in the saloons.

It is, of course, mainly to the technical aspects of the problem of the Panama Canal that the international board of engineers now in Washington will address themselves. There is, however, another highly important side of the question. This relates to cost, and to cost,

moreover, under Government construction as compared with private contract. Congress may yet have to pass upon the pecuniary argument; for it is not impossible that the engineers may submit alternative plans. In that event, the finances of the case may prove the controlling element. Certainly, neither the President nor Congress can feel that there is good prospect of economy in building the canal by the Government direct, after the way in which the $10,000,000 initial appropriation has melted away with so little to show for it. This consideration should call attention to one great merit of the Lindon W. Bates plan. Chairman Shonts, in laying it before the engineers on Friday, spoke of it as "interesting," but said that it was lacking in "details." It has, however, one most significant detail. This is a specific undertaking to contract, with ample financial guarantees, to complete the canal within the Congressional appropriation. If it comes to a competition between projects equally good on technical grounds, it may be the conclusion of the guardians of the Treasury, who know well the temptation to waste in public works, that this money argument should be decisive.

Nothing actually incriminating appears in the letters of Assistant Secretary Loomis and certain Ohio promoter-politicians, which were published by the *Herald* on Sunday, but they deepen the unpleasant impression made by former disclosures. He seems clearly to be of that most unfortunate type of public servants about whom grafters buzz and money-grabbers swarm. We now have the distinct evidence that he was backed for appointment to Venezuela, and with his consent, by men who, he knew, were looking for chances to make money in that country, and were counting upon his official aid. The situation was one of gross impropriety, but it does not seem to have troubled Loomis's robust sensibilities. From the first, he appears to have conceived of the public service as necessarily affected by a business interest. One wonders whether, if these letters had been before Secretary Taft, he would have let Loomis off with so awkward and lefthanded a splash of whitewash as that he actually gave him. And if the President is really thinking, according to Loomis's frequent boasts, of assigning him to another diplomatic post, the casual publication of these letters must give him a shiver. What other Loomis record may not any day leap to light?

Gov. Cummins, as even his enemies would probably admit, has thus far had the best of his exchange of compliments with Secretary Shaw. Indeed, the Secretary may possibly find it hard to decide just what to do next. His original letter was in a vein of vast, almost patronizing, superiority. It accused the Governor of misrepresenting his (the Secretary's) own position regarding the French reciprocity treaty; and incidentally hinted that the garbled version must have been obtained by violating the sanctity of the banquet table. The Governor's answer was shorter if more peppery. His authority on Shaw's position, he said, was an editorial in the newspaper of Lafayette Young, one of the Secretary's stanchest supporters, and an accredited expounder of his doctrines. Mr. Young had heard his leader discuss the French treaty. He might have misunderstood Cummins, but it is unthinkable that he should have misunderstood Shaw. Furthermore, if anybody spread broadcast what was meant to be dinner-table talk, it was he. So Mr. Shaw's hands are tied. He cannot turn on Cummins without confounding his own backer. Mr. Young, to complicate matters, is with the Taft party on the other side of the world, and cannot be consulted at less than $6 a word. As the Secretary can hardly improve his position by another retort, this may be an excellent chance to apply his policy of "stand pat."

In brilliance of logic the stand-patters —noted for the profundity of their reasoning—have produced no one to match Representative James T. McCleary of Minnesota, he who would be chairman of the Committee on Appropriations. He has invented an irrefutable argument against reciprocity, and has thus settled the dispute once and for all. "Who," he asks, "can point to a man crying for reciprocity who hopes to have the duty lowered on his own product? The manufacturers of New England ask for reciprocity with Canada, knowing that the farmers of the West would be compelled to bear the burden." In fine, until everybody wants the duty cut on his own product, we are to have no reciprocity, and, indeed, no revision of the tariff. Does the Steel Trust object to lower duty on rails? That ends it; the duty on rails shall remain. Mr. McCleary hardly needs to add that he is "not in favor of a reciprocity that gives up any part of our market in the hope of getting other markets." Nothing more impregnable than this in the way of a definition has been offered the world since in Fielding's 'Tom Jones' Mr. Thwackum proved that honor could not exist independent of religion.

The summoning of "Bull" Andrews from New Mexico to Philadelphia to aid the Durham-Penrose political machine is naturally regarded in Pennsylvania as a real signal of distress. Andrews is one of the choicest graduates of the Quay school of politics. He was the big boss's "man who knew how," the lieutenant who executed the jobs which Quay, for all his toughened political conscience, could only hint at. In 1895, when Quay was fighting for the chairmanship of the Republican party in the State, it was Andrews who snatched the victory at the end. When Quay was bidding for the United States Senatorship in 1899, and again in 1901, the same indispensable aid was sought. Andrews was sent to New Mexico by Quay to practise Pennsylvania machine politics there, with a prospective Senatorship in the new State as a reward. But whenever Quay wanted "something done by the man who knew how," the call was sent out and "the Bull" returned to his old field. The meaning of his appearance in Philadelphia at this crisis is therefore clear. The Republican machine there has undertaken to capture the movement for the purification of city politics. Penrose and Martin are loud in their demand that the voting lists be thoroughly purged. Since some men doubt their eminent fitness as purgers, they have sent for their old fellow-corruptionist to give them a fine moral standing.

Mr. Jerome's emphatic removal of his name from consideration for the Mayoralty was simply what everybody who knew him, and knew the situation, expected. With it, the ill-advised effort to create a demand which he could not refuse—and to do it without the trifling formality or precaution of consulting him—comes to an end. He stands just where he did—an independent candidate for the District Attorneyship, appealing directly to the people over the heads of the bosses, yet ready to accept support from any party group or organization which may endorse him with its eyes open. This means that it must endorse him knowing that he cannot be compelled to endorse either its platform or its candidates, if he thinks them unfit. Those who vote for him must take him for what he is. His personality and candidacy will of themselves enliven the coming municipal campaign. As for the general fusion against Tammany, its outlook would be brighter if there were a more forceful leader in sight, and if also the idea that Tammany can be beaten by raising a municipal-ownership cry were not so hugged. If it is a question of a mere political device, Tammany will defeat the reformers every time. If necessary, it will itself take up the municipal-ownership issue in a more extravagant form than its opponents dare venture, and, as Tim Sullivan remarks, find enough offices and patronage in the new activities to keep itself in power for 150 years.

Battles against Tammany maladministration have continually to be fought over again. Who would have said, after

the struggle it cost the city to prevent Mayor Gilroy from putting a racetrack in Central Park for his sporting friends, that we should have to fight a similar project under Mayor McClellan? Yet his Commissioner of Parks in the Bronx is busy at this moment in devastating Pelham Bay Park by constructing a race-course through its very parade-ground. That stretch of turf, secured by much labor and at great expense, Commissioner Schrader proposes to ruin by carrying through it the "needed facility" of a track for speeding horses. It seems that the Speedway along the Harlem is inconvenient for certain Tammany horsemen, and they must therefore have city money spent and a city property disfigured in order to enable them to give their blooded animals a spin. It is a gross impropriety and affront, which the Mayor should instantly forbid. Furthermore, it is apparently quite illegal, as Mr. Philbin, acting for the Metropolitan Parks Association, contends, and can be stopped by the courts. To say nothing of interfering with those who wish to use the parks for quieter pleasures, and of actually imperilling children at play near racing horses, the track would be a characteristic Tammany monstrosity from the point of view of good taste. Show a Tammany official a fine stretch of meadowland, and his only instinct is to dig and blast a road through it, and so make an eyesore of what should be a rest.

The separate Statehood convention which has taken a recess from its deliberations at Muscogee, I. T., in order to formulate a Constitution for a State to be organized independently of Oklahoma and called Sequoyah, is largely in the hands of white and mixed-blood politicians. Their clearly discerned motive, showing behind the surface pretension that Indian Territory objects to a union with her Western sister, is to increase the West's representation in Congress. A well-defined feeling exists west of the Mississippi that the Eastern States are unduly prominent in the Senate. Of course, the "injustice" of giving the same Senatorial weight to Rhode Island and Delaware as to Missouri and Texas has led to resentment. At the Muscogee convention this rather vague sectional prejudice has been appealed to by hints that a movement which should make four United States Senatorships grow where none grew before would open up bright prospects for tribal politicians. The same feeling, as yet timidly expressed, is likely to be increasingly effective in keeping Arizona and New Mexico apart. In the end it will be a more powerful argument than the race prejudice between the Arizona "gringo" and the New Mexican "greaser." Single Statehood for the "twin Territories," however, will hardly be defeated by the manipulators of the Muscogee convention.

The strike of the Amalgamated Sheet Metal Workers in this city is one of those gratuitous performances that apparently serve only to deepen the public distrust of labor leaders. The sheet metal workers proceed on the theory that Parks and Weinseimer did not do the cause enough injury, that further demonstrations of ignorance and bad faith are needed. The situation is clear enough. The executive committee of the general aribitration board of the Employers' Association and the unions has decided that the strike is in direct violation of the arbitration agreement, and has ordered the metal workers to return to work, pending a settlement of the dispute. An arbitration agreement to which one of the contracting parties pays no heed whatever is, of course, so much waste paper. The frequent complaint of employers that the negotiation of such a treaty leaves them exactly where they were before, is too often well-grounded. The employer, with his tangible property, may be held accountable for a breach of contract, but an unincorporated union is as elusive as quicksilver. The steady refusal of unions to incorporate and assume responsibility continues to lay their motives open to grave suspicion.

The convention of anthracite mine-workers, to formulate demands upon the operators, is announced for the first week in November. The present agreement with the operators does not expire till spring, but the miners remember the proverb about the early bird. Recognition of the union is to be the chief contention. That is the point for which President Mitchell will stick, the point also upon which the operators, we conceive, will refuse to yield. It is worth while to remember that recognition of the union was one of the causes of the great strike which was settled by arbitration, and that the decision of the board was for the "open shop." There may be changes in social conditions, cost of living, or methods of mining that may warrant corresponding changes in wage scale, hours of labor, or methods of measuring work. On these details the public is not informed. But a fight over the open shop is a fight, not over a detail, but over a principle. If it was sound in 1903, it is sound now.

By the wide sweep of their subpœna net, we judge that the insurance investigating committee means business. Officers of the large companies—the "Big Three," the "Racers," as they have been variously called—are summoned, and their examination, if it be made searching, should add much to the stock of public information. It is commonly suspected that the really unhappiest men in New York, during the time since the Equitable doors were blown open, have been, not the officials and directors of that company, but of its chief competitors. The former knew the worst; the later dreaded that it was yet to come for them. Consequently, there has been an amount of preparation for the approaching ordeal which might well have wrecked the health, and entirely destroyed the mental and moral composure, of more than one man high in directorates. But such sufferers do not know what relief, if not recovery, may go with publicity. Let them contemplate the present comfortable estate of the Equitable directors! No more swords are hanging over their heads, for the sharpest ones have fallen. Let the fearful saints who are shuddering lest a fate like Depew's befall them, fresh courage take.

"There's naught, no doubt, so much the spirit calms as rum and true religion." When Byron, with prophetic foresight, in this way laid down the great principle upon which the Subway Tavern was to be founded, he was, without knowing it, a sociologist. The inspiring science of sociology—or is it an art?—had not yet been invented. Our colleges were not strengthening the minds of youth with the high and severe discipline of courses in "drunkenness, drainage, and divorce"; slumming parties were not yet a popular amusement; Bishop Potter had not even been born. Still, in those days of more than Egyptian darkness one poet at least had a vision of the taste and capacity of the glorified man of the future. The mere fact that the Subway Tavern has failed to pay we count as nothing—a mere accident of time and place. New York and her undeveloped citizens are not worthy of it. From the womb of time shall surely spring a race that can and will realize the lofty ideal. There was only one Subway Tavern; it therefore suffered because it was a sociological experiment station. Sight-seers, amateur philanthropists, theological students came in squads to see the submerged tenth of the city in the very process of emerging, to see the Demon Rum tamed in his own den, to see the million slaves of alcohol strike off their shackles and triumphantly fill the foaming beaker with ginger-pop. It was a thrilling spectacle; it drew tears to the eyes of the most hardened reformers; but it was too good to last. As Mr. Dooley notes, the honest workman wants to enjoy his few simple vices undisturbed. Even the most calloused of men will grow tired of being pointed at as a curiosity. The ordeal was too severe for the most public-spirited denizens of the region about Mulberry and Bleecker Streets. Bishop Potter and his set might have enjoyed the rôle, but mere Mulberry-Benders were not up to it.

GOVERNMENT PRINTING.

On the eve, as we probably are, of the publication of the report to the President on the scandals in the Government Printing-Office, the article in the September *Atlantic* on "The Problem of Federal Printing" falls especially pat. It is by W. S. Rossiter of the Census Bureau, and is a quiet, mostly statistical account of the enormous development and great cost of this branch of governmental activity. The Public Printer of the United States, in a word, directs the greatest printing-office in the world, it being in capacity and output five or six times as large as the Imprimerie Nationale.

Mr. Rossiter's figures show strikingly how the Government at Washington has become more and more adrip with printer's ink. In 1790 the total cost of Federal printing was $8,785; in 1904, $7,080,906. By the graphic chart illustrating the expansion of this business, it appears that there have been ups and downs in it, but that since about 1892 the curve has swept upward continuously and portentously — the total outlay having nearly doubled in that period. Mr. Rossiter estimates that the cost of Government printing in the decade 1900-1909 will exceed $60,000,000—or more than had been spent on it from 1790 to 1880. It is not surprising that alarm has been taken at this making of many books in the Government Printing-Office. President Roosevelt has discovered a superfluity here, much of the sort that Baring-Gould denounced in German printing, and has called for retrenchment, though it has not been observed that he himself has furnished the Government printers less "copy" than before. Congress has appointed a joint committee to inquire into the matter. On all sides it seems to be agreed that the public printing has increased, is increasing, and ought to be diminished.

But to take the backward step is always the rub, in such matters. Everybody is willing that everybody else should leave a report or monograph inedited, but, as for his own, the machinery of Government could scarcely go on unless it were got up handsomely with charts and plates. The truth is that the printing habit has grown upon us immensely. It is not confined to the Government at Washington. The various States show an increase in public printing almost as marked as that voted by Congress. Their total outlay on this item, Mr. Rossiter informs us, has nearly doubled in twenty-years—rising from $1,561,350 in 1880 to $2,740,323 in 1900. Five or six States, and those in general the most backward, have been able to curtail this expense, but the others have pushed it to higher and higher figures. New York's printing bill, for example, was $145,610 in 1880; in 1900, it was $654,330. Doubtless there has been extravagance in State work of this kind, though most of the States let it by contract; yet there can be no question that the great increase in Government publications has met a popular demand. The people have been rather proud of the elaborate State and Federal reports on forests and fisheries, on mines and water-supplies, on insect pests, and improved grains and better methods of cultivation—in short, on every topic or entity in the heavens above or the earth beneath that could interest a village Solomon. And we Americans are, in this respect, the envy of foreigners. More than once has the London *Spectator* sighed over some elaborate volume *de luxe* issued by our Printing-Office, of a scientific or social interest, and regretted that such work could so seldom be matched in Great Britain.

No utility, however, no æsthetic gratification, can justify waste; and that the Government Printing-Office at Washington is extravagantly conducted, Mr. Rossiter's showing leaves one in no possible doubt. The cost of printing is "decidedly higher than the charge for similar commercial work." Indeed, asserts the writer we follow, if this Government plant doing a business of $7,000,000 a year were transformed into a private concern, "the owners would discover that the charges for product, although they do not include the usual and important items of rent, interest, and profit, are nevertheless from one and one-half to ten times as high as the prices charged for similar work by printers who include the omitted items." Let prescribers of the Government-ownership panacea take due note of this. It is the ugliest symptom of the disease they are treating.

Mr. Rossiter's explanation of the fact that "it is practically impossible to secure from Government employees the work—clerical or manual—that is expected and exacted from employees of private concerns," is, to say the least, engagingly simple. The reason is not, he protests, politics. It is not wrapped up in the nature of public administration. No; the trouble is with "the climate of Washington." He must mean moral climate, for printers certainly do the average amount of work in far hotter cities; Kipling describes a scene of almost demoniac activity in the office of the *Pioneer* of Allahabad. But in Washington, avers Mr. Rossiter, there is a "lack of commercial excitement" and that "rush and bustle" which keys up workers elsewhere. Yes; and there is also, as every one knows, the feeling that Uncle Sam is the sleepiest and most lenient of employers; that there are Representatives and Senators to keep you in your job, no matter how worthless you are; and all the complex of motive and influence which makes Government work notoriously more costly and less efficient than private. If a really competent Public Printer were employed, paid what his services were worth (not the mere $4,500 now assigned to the superintendent of a $7,000,000 business), and given an absolutely free hand, with a warning to the politicians not to meddle, he could doubtless effect great economies and tone the Printing-Office up as it needs; but short of some such radical reform we are likely to see small improvement.

ENLIGHTENED SELF-INTEREST.

Gov. Folk of Missouri, speaking at Chautauqua recently, dwelt with very natural pride on the fact that, since he began his fight for the enforcement of law in Missouri, immigration to the State had increased 25 per cent., and real-estate values to about the same extent. It may be true, as Archbishop Whately said, that, while honesty is the best policy, the man who is honest for that reason is a knave. At the same time, the prosperity of a State which has just gone through a drastic process of reformation, even though the relation of cause and effect is not made out, is the best imaginable answer to the ever-recurring argument that whosoever exposes abuses at home is "defaming the State" or "befouling his own nest." Even well-intentioned citizens have been slow to see the value of the advertising which comes to a community that has resolutely set about the cure of its political and social ills.

The same "hurting business" argument has been used more often, probably—though less publicly—in connection with disease epidemics than anything else. Ibsen has used the fight of a courageous young physician against the polluted water supply of a health resort as the subject of his play, "An Enemy of Society," allegorically thus representing himself and his hostile critics. The "hushing up" of incipient epidemics is often regarded as part of the duty of city officials. The recent reported threat of "prominent business men" to boycott Bath Beach physicians who gave any information about the prevalence of typhoid fever there, was a case in point. Of course, attempts of this kind are sometimes successful, and visitors are welcomed throughout an epidemic, quite unaware of their danger. But the policy of frankness has its profits. The householders of New Orleans to-day wear on their coats cheerful buttons announcing, "My cistern is all right. How about yours?" Their fight against yellow fever is being made in the open, and the grand jury is investigating the officials who are alleged to have kept it dark in the past. Can anybody doubt that the city stands better before the country in every way than if stories of "Yellow Jack" were merely whispered on the streets and fright had only rumor to feed on?

It is not likely that the time will ever

come when powerful business interests of a city will bribe the district attorney to put Mayor and Common Council in jail, for the sake of the profits that follow reform, or induce the health officer to invent a visitation of disease in order that the city may have the credit of being frank about it. There are just now, however, several less conspicuous instances in which business interests long responsible for abuses of one kind or another are taking a more far-sighted view of the consequences of their policies. In other words, in certain lines self-interest in this country is becoming perceptibly more enlightened. One of the most prominent illustrations of this is that of the lumbermen. From the time of the first settlements they were the unrelenting foes of our forests. With amazing speed the vast tracts in the Middle West were denuded of their timber, with no thought of provision for the future. Yet, brought up sharply by the imminent failure of supply and the loss of their means of livelihood, the great lumber companies have been adopting of their own accord methods of scientific forestry, and President Roosevelt was able to say before the Forest Congress that "henceforth the movement for the conservative use of the forest is to come mainly from within, not from without; from the men who are actively interested in the use of the forest in one way or another, even more than from those whose interest is philanthropic and general."

Another notable instance is furnished by the pure-food agitation. When the demand for legislation on this subject began, even the honest manufacturers were generally opposed to it; not because their own business would be injured by the punishment of adulteration and misbranding, but because they feared the general unsettling of business—and with good reason in a business so dependent on capricious popular tastes. This, too, has changed. The better class of food manufacturers are among the advocates of a national pure-food law, and they are finding that there is a public willing to recognize the value of products above suspicion. In this connection may be recalled the hopes expressed in the Franklin Institute's recent discussion of shellfish as carriers of disease—that the oystermen would find it a "distinctly desirable business proposition" to keep out of polluted waters and make their wares conform to every sanitary requirement. Most surprising of all has been the changed attitude of some of the patent-medicine manufacturers, who, after fighting by fair means or foul every effort to secure publicity of their formulas, have voluntarily made these public. People were slow in grasping the fact that many, if not most, of the widely advertised nostrums were actually harmful by reason of the alcohol or narcotics they contain. Now that this is better understood, the only possible defence is in the abandonment of secrecy, and a few have taken this step before the law compels it.

That everybody will one day be good because it pays, is a consummation not to be hoped for. Indeed, it is unfortunately true that virtue does not invariably pay. The real value of such instances as are cited above is that they reveal the reformer as a somewhat less visionary and impractical creature than he is commonly represented. And since out of his past work have come occasional dollars and cents, he may have so much the better credentials for his next undertaking.

SENATOR DEPEW SETTLES.

On July 31 the Attorney-General of New York brought suit against Chauncey M. Depew for having, among other things, "neglected or refused to pay the amount of the losses" which the Equitable had suffered through its loan of $250,000 to the Depew Improvement Company, although "said Depew and others . . . agreed that they would save said defendant society harmless from loss." On August 26, the Equitable, in its answer to the suit of the Attorney-General, stated that it was making a thorough legal examination of the Depew loan, "with a view to recovering, either by action or by adjustment out of court, any sums that may be found due to this defendant." A week ago, Mr. Depew paid up. For himself and his associates he turned over to the Equitable $293,850.82, the amount of the loan with interest. That is, he made the "adjustment out of court." He is therefore fully entitled to the credit of having settled rather than face legal proceedings. That we cheerfully accord him.

Whether, however, any such moral grandeur attaches to his action as he seems to imply; whether his explanatory letter is wholly consistent with his secret but sworn testimony before Superintendent Hendricks; whether the clearing up of this loan complication, supposing it to be complete, covers all that was shady in his relations to the Equitable—these are quite other questions. Mr. Depew now writes: "I purchased for $100,000 in cash a one-fifteenth interest in the stock of the [Depew Improvement] Company." This is a more dignified, but a much less picturesque, account of the transaction than the one given by the Senator under oath on May 9 last. On that date, he testified that he had refused when Mr. Webb asked him to purchase $100,000 of the stock, and that thereupon the latter said:

> "Very well. I knew what you would say, and so I have opened an account in my bank. I have put up the stock as collateral. I have borrowed $100,000 for you, so you need have no trouble, and here are a check and note, and you sign these two. You have got your stock, and in three months it will be sold out and you will make a handsome profit."

In the matter of the guarantee against loss which Mr. Depew gave the Equitable, there are obviously legal niceties which could be tried out only in court. The Equitable thought it had a complete guarantee. However, when the document was produced by Superintendent Hendricks, and Senator Depew was asked if he considered that it fixed "any liability on you of any kind," he blithely replied: "As a lawyer I don't think so." As a lawyer, he may have been right. It it not for a layman to say he was not, lacking a judicial decision. But what is plain to the wayfaring man who reads the testimony of Gerald R. Brown, superintendent of the Equitable bond-and-mortgage department, and of Alvin W. Krech, president of the Equitable Trust Company, is the fact that tne guarantee was regarded as absolutely binding, and that, on the strength of it, and at Mr. Depew's request, the referee's deed of foreclosure was not put on record. Mr. Krech described the transaction as "simply a postponement of the payments of the debt practically from Mr. Depew and his associates."

Over the legal and moral question of his having, as an Equitable director and a member of its executive committee, helped secure what was practically a loan to himself, Senator Depew glides lightly. He now says: "I was, of course, cognizant of the negotiations for this loan." But in his sworn testimony before Superintendent Hendricks, we find this question and answer: "You voted in favor of this loan on the executive committee?" "I think I did." Let the statutes of New York make the fitting comment:
